VI. The fourth, or The Stony, or Rock Rasp-Berry. Its Root creeps about, and shoots forth several Branches from the Stalks as they creep. It is but a low Plant, and is more of the Rasp-Berry kind, than of the Bramble. It has several slender, reddish, juicy berry Branches, little more than a foot, feveral half a Yard high, without any Thorns or Prickles at all on them, the Leaves are set here and there, on the Stalks, and stand on long foot Stalks, being rough, and three always join'd together, dented at the edges, and of a red, and of a flinty, or harsh binding Taffe. The Flowers stand at the tops of the Branches, three or four together, consisting some of four, and some of five Leaves a-piece. of a pale, or which Nick's color, which afterwards turn into small Fruit, composed of three, four, five, or more small Grapes like Bunchings out, larger than either in the Bramble, or Garden Rasp-Berry. The whole Berry is of a reddish color when it is ripe, and almost transparent, full of a sweet pleasant acid Jason Tffe, very grateful to the Palate, having in each of its Bunchings out, a small white rough Gran, or bead.

VII. The fifth, or Our Knot-Berry. Its Root creeps much and far, shooting forth small Vines at the knotty Joints, by which it is fasten'd in the Ground, and from thence springing up drives new Shoots or Stalks. It rises up with flender-browned Stalks, fearfully exceeding a foot in height, unless the Soil be very good, yet with four or five large Leaves, one above another, as several joints, each of them divided into five parts, and each of them somewhat deeply jagged, and divided also round the edges, rough and as in the same crystal, each upon a long foot Stalk, which at the Joints have a few small pieces like Raisins growing threed, each Stalk being garnished at top, with one flower, consisting of five round pointed Leaves, of a dark purple color. Being well grown, there follow a large Berry, like to a Mulberry, consisting of five large parts, together, of a reddish color when it is ripe, and of a sweet and pleasant Taffe.

VIII. The Plums. The first grows generally with us in Gardens throughout the Kingdom. Gerarde says, that it grow not Wild that he know of, except in a Field by a Village in Lancashire called Horwood, not far from Blackburry, also among the Bushes of a Copse near Wigan, all three, two miles from Nantwich in Cheshire, I have formerly found it to grow Wild allso, in some parts of the Peak in Cheshire, not far from a Town called Lathom, the second grows on Hills and higher Grounds in divers places. The third grows in many places in the North of England, as, Ciehshire, Lancashire, and Yorkshire, also in Yorkshire, in many of the Downland Fields, and Arable Land in several places. The fourth, in the Stoney and Rocky places in the Isle of Man, and other places in Kent, it grows also in Huntingdonshire and Northamptonshire. The fifth grows on the high Hills in Lancashire, it loves open and Snowy Hills, and Mountains, and grows plentifully upon Ingleborough Hills in Yorkshire: named, and it is growing on the highest Hill in England, as also upon Prades Hill in Yorkshire, which is another Hill, nearly as high as the former, and other like places.

IX. The
The Virtues.

XIII. The Liquid Juice of Roots, Leaves and Stalks. Taken at 3 or 4 O'clocks at a time in any convenient Vehicle, as Red Wine, 
&c., it stops all fluxes of the Bowels, fluxes of the Worm, and delusions of Humors to any Sore, Ulcer, or other part of the Body, it is excellent against Catarhs, and mixed with Honey, or Syrup of the Berries ripe or unripe, it is good against Sores and Ulcers of the Throat, Mouth, and Secret parts, and is also very preventive to the speedy healing of Green Wounds.

XIV. The Liquid and Infusiate Juice of the green or unripe Berries. They have both of them all the Virtues of the former Juice, but much more effectual to all those Intentional. The Liquid Juice may be given Morning and Evening from 1 Spoonful to 3, in a Glass of Red Port Wine, or other proper Vehicle. The Infusiate Juice may be given from a Dram to two Drams or more, dissolved in the Decoction of the Leaves, or in Red Syrupick Wine, and then sweetened with the Syrup of the ripe Berries. They are both good against the heat and Inflammation of the Throat, Almonds, and Mouth, stop Spitting of Blood, and all sorts of Fluxes of Blood whatsoever. And mixt with Honey are good to heal Soe Eyes.

XV. The Decoction of the Roots, Stalks, Leaves, Flowers and unripe Berries, in Wine or Water. It has all the Virtues of the former Liquid and Infusiate Juices, but must be given in greater quantity, as to 4 or 6 Ounces of wine Morning and Night, mixed with Syrup of Althea, or Syrup of ripe or unripe Rosc-berries, it makes an extraordinary Gargle for a sore Throat and Mouth, takes off the force of the hot Inflammation, and in a little time cures a healing; and being also swallowed down, it cools and repelleth inward Fevers.

XVI. The Decoction of the dried unripe Berries. It has the Virtues of the former Decoction and of the Juices, and may be taken in the same Dose of the Decoction, either alone sweetened with the Syrup of the Berries, or mixt with some proper Wine. It is good against the Poison of Scorpions, Serpents, and other Venemous Beasts, being both inwardly taken in Wine, and outwardly fomented upon the part stinging hot, or as hot as it can be endured, for some considerable time.

XVII. The ripe Berries. They are eaten raw, and so they cool, abate the heat of the blood, temper the Fevers, even of the Pethential, appeatrate the Stomach, and appeah, and clear the Spirits; and are of extraordinary benefit, to be plentifully eaten by such as are troubled with the Stoms. It or Scarry, viz. the Stomachs Difficult, for they cool, cleanse, and strengthen the Stomachs, and rectifie its healthfull Tones, and will rectifie the Difficult of the Blood and Jules.

XVIII. The Concoction of the Flowers. It is Syrupick or Binding, and of singular good use against all sorts of Fluxes of the Bowels in Man or Woman, taken to the quantity of a Chefs-Nut Morning and Night.

XIX. The Concoction of the unripe Berries. It is all the Virtues of both the Liquid Juices and Infusiate Juice aforegoing, and may be taken Morning and Evening, upon a Knives point, to the quantity of a Chef's Nut. It is very cooling and grateful to the Stomach, and stops Vomiting.

XX. The Concoction of the ripe Berries. It is not to great an Altrigiant as the former; but is of good use to cool and strengthen the Stomach, refit the Scarry, and to take off the preternatural heat of Fevers, and cause a good Appetitt.

XXI. The Syrup of the Juice of the ripe Berries. It is pleasant and grateful, effectual to cool a hot Stomach, and to quench and refresh such as are overcome with Sidereal at Heart and Palates. It refits the Scarry in a hot Constitution, and is very Cordial.

XXII. The Wine of the ripe Berries. It is made of the Juice by a Natural Fermentation, as the Wine of Grapes are made. And when by Age and keeping it becomes fine, it is a noble Cordial, and as much contains the Spirits as other Wine does. Parthum says, that it is generally held at least, that the Red Wine which is actually sold by the Vinters is made of Ripest Berries. As to the truth of this I can say nothing; but this I can say, that the Vinters used by be beholden to the Ruff-Berry for Red Wine, for that there is a Red Grape which yields a Blood or Jos. red, of as deep a Red, as any thing can be imagined to be.

XXIII. The Powder of the Roots and Leaves. It is Syrupick, but of a thin Substantia, for which reason, experience having also confirmed the same it is fled to walk away the Stone in the Reins, and able to break the Stone and drive forth Gravel and Sand out of the Reins and Bladders and thrown on old Sores and running Ulcers, red rho Cancourus, it is said wonderfully to help and heal them.

XXIV. The Distilled Water from the whole Plant and Berries. It is of extraordinary use in cooling the Body, and allaying preternatural heat. If it is taken (being impregnated with a few drops of Spirit of Spirit) it takes away the heat and extinguishes the malignity of all Burning and Malignant Fevers, yet of the Pethentia it fell. And so used it admirably quenches Thirst, and supports the Spirits against Fainting, Swooming, and other like accidents of the Vital.
Salmon's Herbal. Lib. I.

exactly in the same manner as you make Spirit of Wine. It is, if it be done well, as full as strong, and as good as Spirit of Wine, and as pure: and when it is long upon it is cleanly to be known from true Spirit of Wine. It leaves all the fine radish white, and in doing Spirit of Wine does, both in Chymistry and Physiology, and is full as good and as Cordial, being taken as a Dram.

CHAP. DXCII. OF RATTLE-GRASS Red: or, Red LOUSE-WORT.

I. THE Name. It is called in Greek, Αμαρία; in Latin, Pedicularis, and Epifularia, also 
Crissa Calci, or Chiliopera rubra. In English, Rattle-Grass, Red Rattle Gras, Red Cock-Comb, and Red Louse-wort.

II. The Kinds. There are three Species hereof; viz. 1. Pedicularis Pratenst rubra vulgaris, 
Crissa Calci altera, fine Philofiron, Our Common red Rattle. 2. Pedicularis major montana, 
Pedicularis Piafit folio major Budinii, AchemopHBtg major Claff, The greater Mountain 
Rattle-Gras, or greater Red Cock-Comb. 3. Pedicularis montana minor, Pedicularis Piafit folio minor Budinii, AchemopHBtg minor Claff; The Jeffler Mountain red Rattle-Gras. There is also Yellow Rattle-Grafs, or Battle-Grafs, with yellow Flowers, called generally Cock-Comb, and under that Title we have already treated of it in Chap. 143 foregoing, to which you are refeared.

The Description.

III. The first, or Our Common red Rattle. Its 
Root consists of two or three small whitt Strings

Rattle-Gras red; or, Louse-wort.

with some Fibres adjoining to them. It has several reddish hollow Stalks, which are sometimes green also, rising up from the Root, lying for the most part on the Ground, yet some growing more or less, thus many for pickled, laid in Casks, for preservation. So it lies on both sides of a middle line, distinctly denied about the edges. The Flowers stand at the tops of the Stalks and Branches, of a fine purplish red color, like small gaping hollows, after which come flat blackish Seeds in small Huds, which lying long therein, will Rattle by shaking, whence came the Name.

IV. The second, or Greater Mountain Rattle-Gras, or Greater Red Cock-Comb. Its Root is long, thick, and black. It rises up near half a Yard high, with a thick crofted hollow stalk, for something thick, with long Stalks of Winged Leaves, made after the manner of Fir, nothchd about the edges, one above another. The Flowers are like the former, but of a whiffy color, growing in a long Spike, after which follow broader Huds, containing therein flat Seed much like to Louse-wort.

V. The third, or Jeffler Mountain red Rattle-Gras, or Greater winged red Rattle-Gras. Its Root is reddish brown, like Baff, the edges of the thir-spikes of one Finger, with some great Fibres adjoining to it. This smaller kind grows much lower than the last, and with fewer Leaves on the Stalks, which are slender, hollows like unto them. The Flowers likewise are smaller and grow on a shorter Spike, but of a delicate shining red Color. The Huds which follow, are greater than the first, with long thick at their ends, having cornerd Seed within them.

VI. The Places. They grow the first in our Meadows, the second and third in our Woods and Mountainous and Hillly Grounds. In parts of this Land, and are rather a Plague and Annoyance to the Land, than of any good use for the Cattle. The first delights in moist and mellow Meadows, where it encourages and becomes fruitful to the Grass.

VII. The Times. Gerard says the first Flowers in May and June. Parkinson says, they flower in June, and sometimes till August is past.

VIII. The Qualities. They are cold and dry in the first degree, Altirgent, and Vulgarv.

IX. The Specification. It heals the Bloody Flux, stops the overflowing of the Courses in Women, and all other Flux of Blood, and stops all Flux of the Bowels, as also any Flux of Humors to any old running Sore, Ulcer or Fioliia, and is profitable for the speedy healing them up.

X. The Preparations. You may have herefrom, 1. A Liquid Juice of the Plant. 2. A Decoction of the same in rough or Stepick Red Wine. 3. A Powder of the Seed, and Leaves.

The Virtues.

XI. The Liquid Juice. Taken from a Spoonful to two in Red Stepick Wine, Morning or Night, it stops the overflowing of the Courses in Women, and all other Fluxes of the Bowels, as also Catarrhs or Fluxes of Rheum into the Mouth and Throat, and all Rots of Fluxes or Ulcers upon the Joints and other parts, and this Dilligence upon old running Sore, Ulcers, Fioliia's, O'er- coming them speedily to heal, more especially if they be daily used with the same Juice, mixed with an eighth part of Common Spirit of Wine or Brandy. Lavnardly taken also as a Cordial: if
CHAP. DXCIII.

OF REED -- BURR: OR, SEDGE.

I. THE Names. It is called in Archib. Saffarierman: in Greek, Σδησσαμον; (Fasch. good erect as fasic colon.) Alfo Edulis, Alphidion, Gladiolus, infculatus, (be tired it is Sword like, and double edged;) one think it to be Buer, Butum Thophrabi, que eft Herba palustris, acutum habens aciem speciaque: in Latin, Sparganium, and Xiphion, which is the Platanaria Dodeca & Thalii, because the Burr of it are like to the fruit of the Plane Tree: But Locessus calls it Carex, which to me items the more proper Name: in English, Burr-Reed, Shear-Graft, Scaud-Graft, Burr-maced, Sedge, which Iaff, is the proper English Name.

II. THE Kinds. There are several forts of it, the three following are chief, viz. 1. Carex Ramaf, Sparganium Ramafum, Platanaria Dodeca & Thalii, Butum Thophrabi Rellio & Angulasa, Alphidion Disferidns, Our Sedge, or Burr-Reed Brachted. 2. Carex non Ramafum, Sparganium major non Ramafum, Sparganium atemus Dodeca, Platanaria altera Dodeca, Sedge, or Burr-Reed not Brachted. 3. Sparganium major Ramafum Virginiacum, The great Brachted Burr-Reed of Virginia.

The Description.

III. THE left, or Our Sedge, or Burr-Reed Brachted. Its Root is Bulby, consisting of a great number of Strings and fine Fibres. It has larger, broader and rougher Leaves than those of the Cat-
Salmon's Herbal.

Salmon

The Virtues.

XI. The Deception. The Root being made into a {Decoction in Wine} [for so I suppose Diversors is to be understood,.datur radix ex uino contra Serpentium Venenam:) is good against the Poisons of Serpents. But Gerard says, that the Knoes or rough Burs of these Plants, boiled in Wine, are good against the Biting of Venomous Beasts, if the Deception is either drank, or the Wound washed therewith.

C H A P. DXCIV.

Of Reed Common.

I. THE Name. It is called in Arabick, Cofab; in Greek, Sarcof; in Latin, Calamus, Horando, & Arundo; in English, Reed.

II. The Kinds. We shall not here enumerate the vast numbers or Species of Reeds, which grow in most parts of the World, but those only which grow in England, and our Plantations beyond Sea, in the West Indies, and there are the three following, viz. 1. Phragmites Podnae & Raucis, Arundo Vallaria Lobelli, Horandus vell Arundo Vallaria, Arundo Palustris Mathonii, Arundo vel Calamus Valentia, Our common Pool Reed. 2. Horando vel Arundo multijuga Anglici, Our English Finger Reed. 3. Arundo Donax, Cape Reed, Calamus vel Arundo Cypris Donaci, Calamus Italics minor, Arundo Andrea major Canevaris, Arundo major Hispanios, Calamus vel Arundo major Carolinis, vel Floriditana, The Carolina, or West-Indian Cane Reed. This without doubt may be the same Cane Reed which grows in the East-Indies, by which reason of the Calms, grows both taller and greater. So that they serve instead of Wood or Timble to make their little Hous’s, Hovils, or Huts of, and to cover them.

The Descriptions.

III. The East, or Our common Pool Reed. Its Root is white, hard, round, long, and with many knobbled Joints, running a foot, but not deep, and founder up Stalks from divers of the Joints. These Stalks are manyfold, great, round, and hollow, and full of flints, not disjoint very far one from another, and run up to a considerable height, as to 4, 5, or 6 Feet high, or more, but higher in some places than in others, with long and somewhat broad hard green Leaves in each of the Joints, sharp on both edges, and somewhat encompassing the Stalk, at their bottoms, bearing a long, and broad Spread, soft, brownish Scurvy at top, where Coldy, or Drummy Reed fits apt with the Wind. The whole Stalk dies, and perishes every Year, but it usually set cut down before Winter, when it is grown white, to force for several Aliments.

IV. The second, or Our English Finger Reed. Its Root, form, magnitude and manner of growing, is much like the former; its difference from that is only in the Leaves, which are each of them half a Yard long, and two or three Inches broad, with several great Ribs or Veins running along them, and parted at the ends into three or four parts, something like unto our Finger Hare-Tongue.

V. The third, or Carolina or West-India Cane Reed, called also Spanish Care or Reed. This in its Root, Stalk, Leaf, and manner of growing, differs not from the last described, but only in its greatness, the Cane or Stalks being harder, thicker, and rising much higher, sometimes to eight, ten or twelve Feet high, (according to the goodness of the Soil) more or less; whose Stalks are further disjoint and harder than in our common Pool Reed; the Leaves are likewise much larger, broader, and longer, having also a very much larger Pennate at top. These Reeds or Canes are of several thicknesses, some of them half an Inch thick or leister, and some three quarters of an Inch thick. These are without doubt the same with those Reeds or Canes which grow in the East-Indies, called Cane-reed, where they grow much greater, thicker, and taller, and are of such a Substance as to force them to make their...
Cane- Reed.

their little Housey or Hatts of, which greatest of their growth, I am perfuaded, comes only from the Root, Soil, and Nature of the clones where they grow.

VI. The Places. All the Cane-Reed delight to grow in moist and Watery places, and Grounds apt to be overflowed with Water, as in Watery Ponds and Ditches, by (oft or slow running Rivers sides, and almost every where, through all the Fine Country. The first two grow in England, the Pot Cane-Reed almost everywhere. The second is more rare, but has been found growing only in England. The third is the Arundo Domestica Mantulima, the Arundo Domus, the Gypsia Domonat, Lobelia, and the Italian major Consanguineus, so that it is one and the same fort which grows in Carolina, Florida, Virginia, Italy, Spain, Cyprus, Turkey, in all which Countries it is to be found growing plentifully. It grows in one Country it may grow much greater, and larger, thicker, stronger and higher than it does in another, which is according to the Soil and Clime, as I have before in- titrated.

VII. The Times. These all Head and Seed, and the Stalks or Reeds come to their perfection of growth and hardness about the end of September, or in October, but are more Searced if cut down in October, or November.

VIII. The Qualities. They are as Gallen fays, hot and dry in the second Degree: alteration, At- tensive, and Cofmicick.

IX. The Specification. They are good against Inflammations, to heal Scald or Scabby Heads, take away Scarr, Morphp, and Dandriff, and to help against the Falling of the Hirt.

X. The Preparations. You may have there from, 1. A Decolation of Roots and Leaves

The Virtues.

XI. The Decolation of Roots and green Leaves in Wine or Water. That made with Wine is best, but for the Poverer fort of People it may be made with Water: bathed as hot as it can be endured upon Inflammations, it cools and softens them. Mixed with Honey and used as a Gargaret, it heals Sorets and Ulcers in the Throat, Mouth and Gums; applied as a Latom to old running Sores, and putrid Ulcers in the Secret parts, or other places, it cleanses them, in some measure stops the Fluxion, and induces the healing. Used as a Cataplasm, mixt with a Quarter part of Spirit of Wine, it is good against a Pernice, or Lachmeny, and a Lysenteria or Bloody Flux, especially if it is often reapeared.

XII. The Cataplasm of Roots and green Leaves. It is made by beating them in a Mortar, adding a little strong Wine Vinegar. Applied it cools and makes hot and sharp Inflammations in any part. It eases the pain, comforts and strengthens joints which have been Luxated, eases pains in the Loins, and cures Anemones Pire.

XIII. The Affec of Roots and the whole Plant. Mixed with strong White Wine Vinegar and applied, it is provable against Scald or Scabby Heads, Scarr, Morphp, Dandriff, Pimples, Breakings out, and Discolorings of the Skin: And prevents the Alopecys, or falling of the Hirt.

CHAP. DXCV.

OF RHEUBARB True and Bartall.

1. THE Names. It is called in Greek, Ρέις; and almost by all Nations Rho, and Rheubarbanum, and do it is called in Latine: and in English, Rheubarb.

II. The Kinds. There are several Sorts of Rheubarb, as 1. Rheubarbom Verum, The True Rheubarb, or True Italian or China Rheubarb 2. Rhopoticum verum, The true Turkey Rheubarb, or Rheubarb of Pontus. 3. Rhum Milesb, Rheubarb spurium, Pekudo Rho, Hippophaenum rautalos or vulgaris, Our Bartall Rheubarb. To these you may add, 4. Rhopoticum sula, Emula latum, Rho capitatum Lobelii, The broad Elecampane Leaf'd Turkey Rheubarb 5. Rhopoticum Angulifolium, Rho capitatum Angulifolium, The narrow Elecampane Leaf'd Turkey Rheubarb. 6. There is another
Salmon's Herbal. Lib. I.

another Rheubarb, called Rhubarbarum Monsbarbarum, Patenia, and Patenia barbata, Lapathum savium, Garden Patience, or Monks-Rheubarb: of which we have already Discourse at Large in Chap. 547, following.

III. Whence the Name might come, or be derived. The Original Name is Rha, which Name it took as it is supplied from the River Rha, now said to be called Volya in Pontus, where the true Root did grow. But whence came the Name Rhubarbarum? Why, some will tell us it came from Barbary, as the Name exprests, and they argue thus, because that which comes from other places is denominated by the place from whence it comes, as Rhaponticum, Rharacicum, Rharacism, Rhaphacism, vol Rhaphacium, which is Rheum, for Moses says, that Sennecum, or Sennicium, is all one with Indicum. But these Difficulties are far from Truth, because that neither in Barbary it grew, nor in the Country of the Tribes, from whence it has been said to be brought into Barbary, did ever any Rheubarb yet grow. And that the Merchants of our Times Trading into those parts, can hear of no Rheubarb growing in those Countries now: moreover the Senni are not a People of India, but of Arabia Deserta, where no Spices or Drugs ever grew. Some again will have it come from Barbarium a City of India, above the River Indus, and that Rha-Indicum, and Rha Barbarum are all one. But this may be doubtful, and as far from Truth as the former Opinion: The most probable Judgement can be made is this, that the Greeks and Romans accounted, and called all other Nations but themselves, who were not Civilized with their Breeding and Discipline, Barbarous, or Barbarians: (alluding to those unacquainted People, Inhabiting the Coast and Country of Barbary) and this Root or Drug, being brought from far, and from an uncultivated People, scarcely known to them, they might join to the Name Rha, the Ephedra barbata, and so make up the Word Rhubarbarum, which in process of time became the most usual and known Name, through all the Habitable World.

The Descriptions.

V. The first, or True Rheubarb, or True Indian or China Rheubarb. The Root of this Plant, folid, and in time grows to be very great, has several great spreading Branches, of a dark brownish or reddish color on the outside, with a pale yellow thin Skin under it, which covers the inner Substance of the Root: This Kind and under Skin, being pared away, the Root appears of a fresh and lively color, with Flesh colored Feals running through it. This Root is carefully dried, either in the Sun, or before a gentle Fire, or in the best of a Stove, and with this Caution or Observation, that every piece be kept from touching one another, as it is done in India or China, where they put them upon Strings, that they may not touch, and so dry them apart in the Sun, and this is that True Indian Rheubarb which is brought to us by the Merchants, and Sold in our Drugshalls. This Root when not very old, holds its color almost as well when it is fresh, and gives a yellow Tincture to the Spittle, when it is chewed in the Mouth. When the Winter is past, the Root (in the place where it grows) sends forth young Sprouts, which at their first appearance out of the Ground, have green, round, brownish Heads, rising up from the middle or sides of the Root, which open into sandy Leaves, one after another, very much compacted or folded together at the first, and broadish, but afterwards spread themselves abroad, and become slender, very large, curved on the edges, and almost round, each Leaf standing on a brownish-

Rheubarb China and English.

Stalk, of the thickefis of a Man's Thumb, when they are grown to their full bigness: most of the Stalks are two Foot or more in length, (Especially if the Plant grows in any good and well Ground.) I mean the length of the foot Stalk upon which the Leaf grows, from the bottom of the Leaf to the Root from whence it springs. The Leaf is fefl a foot and a half, or about two feet or more in length, and the breadth thereof is two Feet likewise beiing measured from edge to edge in the broadest place, being of a felf or dark green color: and thicker in Substance than the Baffard Rheum. The Leaf is fefl, and not growing so high at Patience, or Monks Rheubarb, with felf waved round Leaves as grow before, but smaller at every foint up to the top, and among the Flowers, which are white, spreads felf into feveral Branches, contrary to the manner of the Baffard Rheum following, or of any other of the Dockas. The Flowers consist of five or six small white Leaves, so small, barely to be diftinguifhed from the white Threads which are in the middle, and flowing to be all Threads: After the Flowers are fefl, there comes in small brefness, the Seed, which is of a brownifh color, or triangular, or tetrahedrical, like unto other Dockas, but larger, and by which it may appear plainly, that the True Indian or China Rheumarb is only a Species of the Dock.

V. Query. It may well be demanded of me, why I should place Rheumarb, among our English Plants, since
Since it is so apparently an Indian Drug? To this I answer. The reason why I have placed it in the Class of English Herbs, is, because it has already grown in England, where it has been known to prosper and flourish; And therefore I placed it here, to encourage our Country Men to continue the propagation thereof; and if possible it should not arrive to the height of its perfection in our Climates, and therefore may be thought not to be altogether fo strong and efficacious, yet it has been found by Experience to answer all the fame ends, being used only in somewhat a greater quantity; besides it may be planted and propagated in all or most of our Plantations in the West-Indies, where, the Climates being more agreeable to its Native place, it may in some short time be brought forth in perfection, and to be of a publick Service to our Nation. Our Parkinson was the Man in whose Garden this Rheubarb once grew, and therefore what he has said of it, we will give you in his own Words. I have (says he) a kind of round Lord's Dock growing in my Garden, which was sent me from beyond Sea, by a worthy Gentleman, Dr. Lister, one of the Kings Physicians, with the Title Rhaponticum verum, which first grew with me, before it was ever seen or known elsewhere in England, which by proof I have found to be so like to the True Rheubarb, or Rhaponticum, both for form and color, that I dare say it is the very True Rheubarb, our Clarke making it only less living in working, less heavy, and less bitter in taste. For this has great and thick Roots, and are diversely discolored with Vileh colored Veins, as the True Indian Rheubarb, which I have come to form to any who are desirous to see and know it; and also all other smaller Branches of Roots spreading from the main great Root, which smaller Branches may well be compared to the Rhaponticum which Parkinsons bring us, and which appear to be longer and flancender, than the (the Great Tuberous) Rheabar, but of the same color. This our English Rheabar being triad, by taking away its Kind and Skin under it, as you do the China or Indian, appears with as lively and as fresh a color, with Vileh colored Veins running thro' it, that the chiefest China Rheabar cannot excel it; and if it is dried carefully as it ought, by the side of a Dry Oven (because we want the heat of the Sun to do it) and each piece kept one from another, it will hold its color almost as well when dried, as when it is fresh, and great, and strong; and I think that when chewed, it is not so very yellow, nor with so much bitterness and affliction, as the True Indian Rheabar does. I have divers Trees taken upon these Roots, and dried them carefully, and they have been placed in the Riff and mall Stratif, who have approved of them, and divers of our Physicians have oftentimes used them, with many other Persons, to very good purpose. Thus Parkinson.

VI. The second, or True Turkey Rheabar, or Rhaponticum of Ponus. The form of the Root is somewhat round, and long middle, for the most part, (yet there are smaller and shorter pieces, as well as greater which come together;) whole color on the cut side is not all white, but more than the Substance within: for still some is better colored, and founder than others. The belt is firm, and somewhat heavy, not spongy and light, and somewhat brown, but fresh on the cut side, without many blackish spots (which are suspicious places, where, often, the pulp is ruptured and punky,) I joy much, because the leaf pieces have sometimes these faults in them,) but they do not run far inward, yet if they should, the leaf of the piece might be excellent good, and not to be

Rheubarb Pontick; or, Rhaponticum.

or Indian Rheubarb, as may appear by the former Description, so that we need not seek for a new Plant to take this Pontick Rheubarb from, nor describe any other Species, than what we have done before at Sect. 4. above, for every Person of common Reason and Ingenuity may easily see, that as the former (before described in Sect. 4.) is the True Indian or China root, so also they may as easily perceive that this Pontick Rheubarb (the true first, not the false kind, which is Counterfeited with the Great Century Root,) is but only the greater Rarifications of the true China or Indian, cut off from the former, and so Dried and Sold alone, as another Species of Rheubarb. These Reforms thus offered ought to excite our People, to make the Trial, by Planting it in other hotter Climates, as in our Plantations in the West-Indies, where I doubt not, but it would turn to a very good Account.

VII. The third, or Our Buffard Rheabar. Its Root grows greater than that of Variance Rheabar, with many branches, or great Strings, adjoining a yellow on the cut side, and somewhat of a pale yellow within, with some discolored Veins therein, like to those of the True Indian Rheabar, less divided, but much less than it, especially when it is dry, which then has quite lost its fresh color, which the said True Indian constantly holds in its perfection, from this Root spring up divers large, round, thin, yellownish green Leaves, a little waved about the edges, each one flaring on a reasonable thick and long brownish foot Stalk, from among which rise up a pretty big Stalk about two feet high, with some such Leaves thereon as grow below, but smaller, at the top whereof stand in a long Spire, many small brownish flowers, which turn into hard triangular

D. 2 e
Salmon's Herbal.

Lib. I.

Rheum Baffard.

being as green above, and as brown white underneath as they are, and a little unevenly waved on the edges. The Head and Flowers are white also, but only a little longer, so that it is very likely, that the chiefest cause of the difference between them arises from the Soil, or places of their growth. The two last Plants cannot properly be accounted Rheumures, because their form admits them not, but are rather to be referred to the Jacea, Snapweeds, or Centaurian, the Great Common Scales, for the likenesses both to their Flowers and Seed, the Scales of their Heads being somewhat different. Yet by reason of the Names which they have obtained, and of the Custom or Use, which for the Names sake has placed them with the Rheumures, we thought good to comply also, that we might not be singular from all other Authors.

X. The Places. The first and second, which are Natives of India, as China, Indias, as also of Fennec, have grown and Increase in Our English Gardens, and without doors are possible to be promoted in all our West-India Plantations. The third grows with us in our Gardens also, as likewise the fourth and fifth, which are Natives of Turkey: it is probable that the two last, which the Turks call Rrhopotium, is used by them for the True End, after in truth they are not in the least akin to Rheuma, but are mixtures of the last two, of which reason some Authors have called them by the Name Centaurium Indianus, falsa, and by that Name Parkinson says he received the Seeds from beyond Sea.

XI. The Times. They all Flower about the beginning of middle of June, and the Seed is ripe in July. The Roots are to be dried, and then may be kept all the Year, but they are not to be taken up before the Stalk and Leaves are quite withered and gone; and that is not until about the middle or end of October, for if they be taken up a little before the Leaves do spring, or when they are springing up, the roots will not have half so good a color, but look as if they were dead or decayed things.

XII. The Qualities. They are hot and dry in the Second Degree. Aperitive, Alterative, Affregent, Digestive, Transpicvick, Stonatick, Heptick, Splicentick, Hyterick, and Cathartic.

XIII. The Specifick. Indian Ponicck and Baffard Rheumares particularly against the Colds, Gripings of the Guts, and all sorts of Fluxes of the Bowels, more especially the Bloody and Hepatica Fluxes: they purge Ginder and Hesm, and are profitable against the Gout, Jauntyche, Scurrty, Gout, Dropsies, and Scurries. They cure Spitting and Pilling of Blood, the Running of the Rein in Men, and the Whites, and overflowing of the Temp in Women, and are of singular use in the cure of old running Sores, hollow and wanted Ulcers, Filthies, Scabs, and other breakings out in the Heel and Skin, from Salt and Acrimonious Humors: they open all obstructions of the Liver and Spleen, and ease the pains and gnawings of the Stomach.

The Virtues.

XV. The Liquid Juice of the green Leaves or Roots made in White Wine, or in Whey. It has all the Virtues of the Powder, but must be given in double or treble quantity, you may correct it by adding towards the end of the Decotion a little Indian Spirit, or some strongest Spirit, thinly trickled. If it be done on an External use, the Decotion or Infusion may be made in White Wine, Vinegar, and mixed with Honey. And so to be poured on an inflammable and a hot running Stove, and the white eggs put out in the Skin. Drop into the Ear it takes some time, and the Pain Grumbled in the Mouth, it is fatal to the Toothache, and using drank it eases the Jaundice.

XVI. The Powder of the Seed. Given in 2 Drachms in rough Red Wine, Morning and Night, it stops all sorts of Fluxes of the Bowels, chiefly the Bloody Flux: it cures also the Gritings and Grippings of the Stomach, strengthens it, and takes away the loathing of Meat.

XVII. The Decotion or Infusion of the Dryed Roots, in Whey, or White Port Wine. Take Rhenish which strongly fluxes 2 Ounces; Clarified Water, or rather White Lisbon Wine 3 Pints, Infuse in a warming heat, or a Sand heat for 8 Hours close covered; then strain the Infusion and distil it with wine for 8 Days. If it is made in Clarished Wines, it ought to be boiled half an Hour, then strained out and sweetened with Honey or Shrubbet. If a Cold Cream of Tonic or Carbol, it will make it the Medicinemaker Work the better. It is an Excellent thing to purge Choler and Flagon, and cleanse the Stomach and Bowels; and is profitable against Atphem's, Coughs, Cold Cough, and other Diffumptions of those Parts, it cleanses the Stomach, Bowels and Nuts, is good against Ague, provokes Urine, and clears the Five Sights. There is a Compound Infusion, which is thus made, Take Rhenish very hot then fluxed 5 Ounces; which Infuse in Whiteポート Wine, Extract of Seena and Carthusian Seeds of each half an Ounce; a Syrup of Rye, Spirit of Turpentine 4 Ounces; Common Water, 2 Ounces, mix them for 7 or 8 Days. It has all the Virtues of the Infusion, but works for the Toothache.

XIX. The Tincture of Rhenish. Take the half Rhenish thus fluxed, Lisiprowsen well bruised, of each 2 Ounces; Ruffian Powder 1 N0. 65s, Annenbrass bruised 1 Ounce; Sugar Candy 6 Ounces; Spirit of Wine 2 Pounds, mix, digest according to Art, and strain out for Use. Dose 2, 3, or 4 Spoonfuls in a Morning against the Cholic, and Grippings of the Guts, which are occasioned with Liver and Stomach, be digested 8 or 10 Days in a gentle Sand heat, breaking the Guts 2 or 3 times a Day, and then letting it fizzle, the clear is to be decanted, and kept in a Bottle close stopp for Use. It Purges gently, and collects and expels Acid and Tartarous Humors adhering to the Tunicles of the Stomach, which causes violent Pains and Grippings, for which it is indeed a Specific and one of the Chief things in Nature against all the Weaknesses and Dilemmas of the Bowels, especially it accompanieth with painful Distentions. It is of singular Use to Purge such as are troubled with any Dryness in the Bowels, Weeping or Gleet, as also the Whites in Women, Universally being permitted. For even it Purges yet it is but gently, and is strong and admirable, and stops all sorts of Fluxes.

XX. Tinctura Rhenarioridii, Wormwood Tincture of Rhenish. Take Rhenish very hot fluxed, or greatly bruised 4 Ounces; Wormwood Water Compound a Quart, mix in a Dit, Heat, Sieve a gentle Sand heat for 14 Days, shaking the Bottle once a Day, then being settled on Line, decant the said Tincture and keep it for 10 Days. You may also use a portion of the Wormwood Water, make it with a hot Spiritated Water, or any other Cordial Water, which may anfwer the Intention of the Medicine. It has both a Purging and an Allgiarent Property, for it Purges gently Choler, Flagon, and expels and removes all the Tartarous Humors, which cause the Cholic and Grippings of the Guts, from the Stomach and Bowels. Rhenish which it has a Cordial and strengthening Virtue, and is especially good for the Stomach, Heart, Liver, and Spleen, and is good against Fainting and Swooning Fits, and Strokes at heart. It opens obstructions of Liver and Spleen, uses the Jaundice, and all sorts of Fluxes of the Bowels, as also the Hepatic Flux, from this allgiarent Property. And indeed I know it to be Specific in the most Vehement Fluxes of the Bowels, and will do that (in cold cafes) which a Thousand other Medicines will not do. I have cured Cholics and Vehement Grippings of the Bowels with it, of several Months standing, and that after all other Medicines had used, had failed. You may use it thus. Take of this Tincture an Ounce, White Lisbon Wine in which a few Leaves of Seena have been Infused 4 Ounces, Syrup of Damoch Ripe Figs, a Quart; mix for a Dose. The Body being sufficiently cleansed, you would stop a Flux therewith, and strengthen the parts, give it thus. Take of this Tincture, of Tincture of Calutch, Syrup of Red Pop- pies, of each half an Ounce; Common Water, Black Cherry Water, of each an Ounce and half, mix for a Dose. And let the Sick take the Tincture in Drops all the Day long, in any thing they drink, about 40 or 50 Drops at a time. In little time it will cool and corrobate the Bowels, and the whole habit of the Body, that the Patient will think himself to be almost a new Man.

XXI. Extraflum Rhenarioridii, Extract of Rhenish. Take Rhenish this fluxed, rather in Powder a 3 Ounces, Chinese, in graps Powder 1 Ounce, Rhenish Wine 2 Ounces, Spirit of Wine a Pint, Juice of Limon a quarter of a Pint, mix, digest 20 days in a gentle Sand heat, breaking the Bottle 2 or 3 times a Day, let it settle and decant the clear, which Abounds in Alcohol and is very useful for all sorts of Fluxes, to every Ounce of the Extract add a hypol of Orange Peels, a Scrupel, and keep it close covered for 30 Days, to be taken at. half a Dram, or a Dram, in the Morning falling. It expels Choler, Flagon, and Mancephaly from Stomach and Bowels, opens out Gouts of Liver, Spleen, and Rains, is given against the Kickets in Children, Seals, running Swine, Inflam-
Salmons's Herbal. Lib. 1.

de, Green-leeches, and all kinds of Inflamations, and to heal or dry up Scabs, and to put Ulcerous Sores in any part of the Body.

XXII. The Pouder. It is made of the dried Root beaten and feared, adding to every Ounce, a quarter of an Ounce of Arrnfeeds in fine Pouder. Dofe from half a Dram to a Dram, or more, according to Age and Strengh, in any convenient Vehicle, as in a Gralf of White Wine.

XXIII. The Compound Pouder. Take fine Pouder of Rheubarb 2 Ounces, White Rohn in fine Pouder an Ounce and half, Gum Turturi in fine Pouder half an Ounce, mix them. It dilates the bowels, and provokes the Patient to expel, or to purge Choler and Flemng, cleans the Stomach and Bowels, and open obstructions of the Intestines. It is profitable against Scoury, Gout, Dropy, Aques, and Jaundice, to pickling the parts of the Pleura or Sides.

XXIV. Syrupus of Rhabarbor composing Syrup of Rheubarb Compound. Take Rheubarb very thin sliced, Indian, of each 5 Ounces, Violet Flowers 2 Handfuls, Cinamon half an Ounce, Ginger 2 Drachs, Waters of Bostry, Beefe, Cithery (or rather Angelica) of each 3 Parts, mix and digest in Boile or a Sand bath all Night, the next Morning drain out, and with double refined Sugar 4 Drachts, make a Syrup by boiling, adding when all is done Syrup of Roffe Solution, 8 or 12 Ounces, mixing them well together. It gently cleanses the Stomach and Bowels of Choler, Flemg, and Melancholy, allays the heat of Inflammations, stops hot Rheums, and sharp Fluxes of the Bowels, by leaving a binding quality behind it. Dofe 5 or 6 Ounces in Clarified Whey, or a weak Infusion of Senn in White Wine.

XXV. The Diet Drink. Take of Chop's Rheubarb very thin sliced, 6 Ounces, Alexandrine Senna an 8 Ounces, Yellow of Orange Fruits, Horse Radish Roots scraped thin, of each 5 Ounces, Coriander Seeds, Allison Seed bruised, of each 2 Ounces, Juices of Scarvy Gruts, Garden Grrets and Angelica, of each 8 Parts, then ale 3 Gallons, put the Juices into the Ale, and after them, the other Ingredients, in a Neb-bag with a Sore in it after 3 days the Patient may drink of it. It carries off sharp Humors which cause the Colic, Gout, Jaundice, Scoury and Rheumatic pains, provokes Urine, and evacuates Hydropick Humors. Dofe a Pint Morning and Evening.

XXVI. The Garpsifon. Take Decoction or Infusion of Rheubarb made with White Port Wine a Quart, White Wine Vinagar, Spirit of Wine of each half a Pint, Rheubarb very thin sliced 3 Ounces, Medlar Roots in gripes Powder 3 Ounces, Rum a dram 5 Ounces, mix and digest in a gentle Sand heat for 24 Hours, then add Honey 6 Ounces, distill again 24 Hours, pour out the Juice and keep it for Use. It cures all forms of Sores, Canker, and purtie Ulcers in the Throat, Almonds, Mouth, Tongue and Gums, they being watery or gorged therewith for a time a day it cleans also and heals Ulcers in the Soreness or other parts, being rightly applied.

XXVII. The Distilled Water from the Green Leaves and Root. It is used to allay or cool

CHAP. DXXVI.

OF RICE.

1. THE Name. It is called in Arabick, Ḍarr and Ḍeṛis; in Greek, Ὁδύς; in Latin, Orzus; and in English, Rice.

2. The King's Rice. It is a kind of Rice, inter leguminosum quos inter Cerealis, as it did Our and Parch, but I can see no Reason for it, nor any Force in his Argument for the Rice, nor that their forms, manner of growing, and Quality of Rice, is different. It is a singular Plant of its own Kind, but may be enumerated, or receive, an Epithet from the Country in which it is produced.

The Descriptions.

III. Its Root in Bulbs, composed of many Strange and Fibres, which persifts every Year, as the Roots of other Grains do. It rises up with a Branner Stalk than Wheat, about a Tard High, with several Joint, and a large thick Leaf at each of them. Take unto the Reed. At the top it bears a fringed John, Leaf or Head, pressed out into very many Branches, which burst Blosoms of a purpurh color, with the Seed or Grain growing finely on them, emblazoned in a hard, fruted and yellowish brown Husk, with an Army at the end of it, which Grain being Baked, is very white, blunt whiten ends, and nearly as large as those of Wheat.

W. Gerard
Rice.

IV. Gerard defcribes it thus, food is growing in his Garden. The Rice which (saith he) 1.d grow in my Garden, had Leaves soft and Goose like Baty. The Flower did not them it fell with me, by reason of the Infection and Uffage, chambers of the Tear. Theophrastus says, it is a Flower of a purple color. But says my Author, Rice has Leaves like unto those of Quails Grals or Baty. And a small Straw or Stem fall of Flowers, like to other Cereals, at the root thereof grows a Bush or Tuft, garniſhed with round Kifs like small round Goose-berries, in which the Seed or Grain is contained, every one of which has at its end one small, long, rough Awe or Beard adjoin'd to it, like that of Baty.

V. The Places. Strabo reports that Rice grew in Water in the Territories of Babylonia, and near Babylon, in Syaom, and in the lower parts of Syria, where it grew to be near foot high, and bore plenty of Seed or Grain. It grows now, not only in those Countries, but also in the Provinces Islands, or Annoes, and in Italy and Spain, from whence great quantities have been brought to us, hulk'd, and prepared, as we now Buy it; it properes left in Fenny, Wet, Moift, and Watery places, which are often overflowd with Water; But it is thought that the Original thereof came fift to those parts of the World, out of the East-Indies, where it is their chief Food, if not only Core live upon, but it has not been found there only, but through all Ethiopia and Africa, from whence it was brought into Syria, Egypt, Italy, Spain, Etc. wherever it has been yet Sown. It loves only to grow in moist Grounds an absoſtly, and such as may be overflowd with Water in the Summer time, and let out again. It is now Sown in Carolina, and become one of the great products of the Country: I have seen it grow, and Bounti there, with a vast increafe, it being abfolutely the best

Rice which grows upon the whole Earth, is being the weightfuſt, daintieſt, cleaneſt, and whitift, which is been yet seen in the Habitable World.

VI. The Times. It is Sown in the Spring in the East-Indies, as Eratosthenes says, and that in a Afternoon and not time. It is a Summer Cereal, and is Yearly Sown, and is kept up or moved down, in the middle or end of Autumn with us. In several Places in the East-Indies it is Sown twice a Year, and probably it may admit of the Fame in Carolina, or the East-Indies, in which last place its goodness is mentioned by its weight, largeness, and whitenes, as I said before; where it is Hulld, as 

French Barly and oat Meal are Hulld, &c.

VII. Note. In Germany, there is a smaller Kind grows, which they call Oraya Germanica, and which Cordeus in Floridarii says, is called Schonoden, being indeed a kind of Rice, but leffer, having the Rice Taille and US, and the same form of growing and proportion, in its Stalks, Leaves, and Tufts, growing in Marbly, or Plathy and Watery places, as the former larger Kind does. This Herba, Poull, and some others would have to be the Hornicae Galáticae Colonnae, which is a Mitake, for that is neither more or less than our Common Barley.

VIII. The Qualities. It is temperate in refref t to heat or cold, and dry in the fift Degree: Aftin gent, Rejuvenating, and Spermato-genetic.

IX. The Specification. It Binds Fluxes of the Bowels, and restores in Consumptions.

X. The Preparations. You may have therefrom, 1. A Broth. 2. A Milk. 3. A Pudding. 4. Sausage, or the Blood thereof. 5. A Cataplasm.

The Virtues.

XI. The Broth. It is made either with simple Water, or with Mullion Broth. It restores much, refors a weakeſt and decayd Body, but binds not the Body as that made with Milk.

XII. The Milk. It is an excellent thing for filling all parts of Fluxes of the Body, and reforing such as are labouring under a Confinmen t, especially where there is an Ulcer of the Lungs. The best way of making it is to boil it fift in Milk, till it is in a manner perfectly diffolved and becomes a thick Pudd, and then to mix lard and make it thinner with Milk warm from the Cow, and fo to Drink or Eat, a Quart or Flip of it Morning and Evening.

XIII. The Pudding. It is made with Rice, fboat alſſt LGBTQ in Milk, and then boil'd till diffolved, add with Eggs, Sugar, Rumfons and Natures grind, it is made into a Pudding, either by boing or bareing. This is alſſ the Broth and a mouth much, strengthen such as are weake, refors them, are Contumivous, encrease Seed, and make the body Vigorous.

XIV. The Blood of Rice. It has all the Virtues of the Broth, Milk, and Pudding, and is made as you make the Blood of Satyrion, Painaen, Porenaus, Comfrey, Etc. Dole a Spoonful, or more, Morning, Noon, and Night, in a Glas of Generous Wine.

XV. The Cataplasm. It is made of the Meat or Broth of Rice boiled with Milk to the Consistency of a Pudding; or it may be made of the whole Rice, boiled to fofrness in the Milk, and then to a con fistency, adding to it a little Barly Flower. It is used to be applied to Tumors to repel Humors Bowing
Salmon's Herbal. Lib. 1

CHAP. DXCVII.

Of RIE.

I. T. H. E Names. It knows no Greek Name. But it is called in Latin, Secale and Farrow, Plini Lib. 16. Chap. 15. But Modern Authors understand by Farrow, only Early. Some have taken it to be Typha cerealis Thunbergii; Cordus on Disporatorium is Celosia; and Tragus with some other took it to be Silago. But Silago, is truly Wheat. In English, we call it only by the Name of Rie.

II. The Kinds. There are three several sorts thereof, viz. 1. Secale vulgatum, Secale Hyemale, Our Common or Winter Rie. 2. Secale aestivum, Dodman, Secale minor, and Vernalis Babihi, Secale Alterium Longifolium, Silago affinis Tragii, Small or Summer Rie. 3. Secale Lapsulium Baby, Great or broad Leaved Rie.

The Descriptions.

III. The first, or Our common Rie. Its Root consists of a Bulk of Strings and Fibres, yet not so thick bulking as Wheat, nor sticking out, or forming the Fertility of the Soil, so shining as Wheat does. It first springs up some what reddish, which afterwards grows green, and brings forth several jointed Stalks, something higher than Wheat, but bearing at their tops shorter Ears than those of Wheat, set in short Rows, with shorter and sharper, rougher, and more prickly Awns. The Grain within is also smaller, harsher, or hinderer, and blunter than Wheat, not excepted in Hands like it, but easily falling out of its slip, when the Ear is ripe. Whence it Flowers, the Ear stands upright, but when it is nearly ripe, it bends downwards.

IV. The second, or Small Summer Rie. The Root of this is very like the former, as also in its Stalks, Leaves, Ears, Flowerers, Grain and manner of growing, being that this grain has much fewer Stalks, and has a shorter and less Ear, but armed with Awns as the other, but softer, as is the Grain, or Worse also. This Rie is Sown in the Spring only, and therefore called Summer Rie, where the former is Sown in Autumn, or Wheat it.

V. The third, or Great or Broad Leaved Rie. The Root of this bears our with Strings and Fibres, like that of Wheat. This Rie has thicker Stalks than the two former, rounder also and greener. The Leaves grow at the Joints, and are much larger than the Common Rie, being about a foot and a half long, and an inch broad, much broader than the other, as you may see by the Figure: they are somewhat sharp or rough about the edges, like those of the Common Rie. The Ear at top, is large and great, set with sharp, long Awns, a full Hand breadth in length, the Grain within is like to the first Kind, blackish brown in color, but greater than it, and almost like to Wheat.

VI. The Places. The first grows plentifully enough with us in England, and very plentifully in most places of Germany and Poland, as appears by the great quantities of it brought into England, in times of Scarcity from Poland, when we have a general want of Wheat and other Grain, as in very wet Years. It is sown also in all the Northern Regions, more especially in Danemarck and those more Northern Countries, than else where, in Clay Climates, or so well tilling to produce Wheat. The second grows also with us in England. The third is brought out of the Eas Country, and in times of Scarcity is many times transported from Danemarck hither. Bohns are the Ear with some of the Leaves, out of Signior Contarino his Garden.

VII. The Times. The first is usually sown in Autumn, in October, and November, when Wheat is sown: the second in the Spring in April, which is not so enduring, but more apt to corrupt than the former, because the Winter comes upon it before it can attain its full perfection or ripeness. The first and third are generally ripe in August. The second comes not to its full growth till September.

VIII. The Qualities. It is hotter than Wheat, being hot in the first Degree, and temperate in respect to dryness and moistness. It is Digestive, or abounding and filling away of Tomats or Humors, to which it is applied. It is also Emphrastic, or of a more obfuelive or clammy Nature than Wheat, and harder to Digest in the Somach, but to Musick Bodies, which have a brisk Appetite, and a strong and good Digestion, it affords good Nutrition, being next in goodnecds unto Wheat, especially if the Corn be sweet and good, and the Bread well made.

IX. The
XI. The Virtues.

The Virtues of Rocket. It is said to strengthen the Head, and helps the Hands and Feet.

XII. The Bread. It is generally made with Leaven. It nourishes much, and is Stronger, yet apt to Grasp some People. Applied hot as it can be endured out of the Oven, to the most Venemous Head-ache, and left on till it is cold, it presently eases the pain, as if it were by Incantation; and if repeated some few times it perfectly cures it. And so applied to the Stomach it helps the weakens thereof, and the Palpitation of the Heart.

XIII. The Bran. It cleanses, mollifies, and diffuses Cancers, being laid hot thereof in form of a Omelette, made with Vinegar, a little Salt, and brandy.

XIV. The Leaven. It is made of the Pulp of Rice Flower, mixed with Salt, or laid in the midst of a Box of Salt. It does more forcibly digest, draw, ripen, and break Aperitifs, Boils and Buboes than Water Leaven. Applied to the Head, it eases the continual pains thereof, cools, comforts, Eases, is dispurifying and abstinere, yet is said to staunch Bleeding, and to diffuse such Cancers as will not subside.

XV. The Cataplasie. It is made of the Crums of the Bread with Wine, or Wine Vinegar. It diffuses Cancers, eases Pains, and is profitable against an Oedema, and the Gout, being finely appiled.

XVI. The Pouder. It is made of the Crust of the Bread almost half burnt, and then reduced to a Pouder by beating in a Mortar. The Pouder it self is used as a Dresser to cleanse the Teeth, they being often rubbed with the same day, laid upon a Cloth. The Decoction of it in Water, made as Coffee, is very Soroinalick, and caues a good Appetite to Food.

XVII. Empolyrema Curtissi Pamis. Take Rice Bread trosted very brown and hard, a Quarter, which being laid in Rose Vinegar to the thickness of a Pudding: After Twisting of this Pudding, Pound the Rice, and yes one Omelette, and make an Empolyrema according to Art. It is hot, dry and strengthening, good against Aches and Pains from a cold cauze; and all old Disease of the Head, Brain, Nerves, Stomach, Womb and Joints. Applied to the Sto-

---

**CHAP. DXCVIII.**

**Of Rocket Garden and Wild.**

1. T HE Name. It is called by the Arabians, Fingers, and Egyptians: by the Greeks, Eswskrs, &c. Authors of Antiquity in confused Obfervations: by the Latins, Erwka, quod vulgaris, Lugdunensium, quod erat cadet; and by the English, Rocket.

2. The Kinds. There are several Species of this Plant, as, I. Erwka major, Garden Rocket. II. Erwka Synephiris, Wild Rocket. III. Erwka Synephris obtusa, Buffon Wild Rocket: of which in this Chapter. IV. Erwka Aquatica, Water Rocket. V. Erwka Marina, Sea Rocket: of both which in Chap. 592. next Following.

Salmon's Herbal. Lib. I.

The Descriptions.

IV. The first, or Our Garden Rocket, is but a Small Kind brought into Gardens, for the True Roman Rocket in the next Section has larger Leaves. Its Root is small and long, with some fine Fibres adhering to it, and a few white, as it has green Stem, and longer Pod. Its Leaves much torn or rent on the edges, smaller and longer Pods than the Roman Kind. The Flowers herof are of a pale yellowish color, whereas the Roman are reddish, consisting of four Leaves. Its Seed is reddish, contained in small, white, bullet-shaped Seeds.

Rocket Garden

smaller and longer Pods, than the Roman which are shorter and thicker, whose Seeds are of a whitish yellow color.

V. The second, or Roman Garden Rocket with white Flowers and Seed. Its Root is like the former, and perishes Annually in the same manner. It is a smaller Plant than the former, but larger or broader Leaves, which are cut in on the edges, but not so much nor so deep; each part being rounder, and round at the end, and nothing bo but or foamy in Tofe. The Stalk has some Leaves thereon, larger, and its Seeds, which bears white Flowers at the top, made of four somewhat long and round pointed Leaves, after which come little round Seeds in several intervals yellowish white round Seeds.

VI. Our Horsetail Roman altera feminine nigroanta. We have another Roman Kind also, which white Flowers in like manner presently after the Seed is ripe. Its Stalks are more than or less high, Branched into many parts. Its Leaves are very like to the former, and at the tops of the Stalks and Branches are two white Flowers made with four Leaves of same, round pointed, with a black line in the middle of each Leaf. After which come long slender Pods, containing blackish brown Seed within white round Seeds.

VII. The third, or Great Garden Rocket. Its Root is much like to the former Garden Kind, with Stalks and Leaves like it, but that the Leaves are broader, and the divisions at the Leaves larger, and smaller at the ends, than those of our Roman Kind, and each part more ancymly dented about the edges. The Flowers herof are more yellow, and containing a Gold color, and the Seed smaller, and much like to the former, with a few fine small Leaves, and a round white round Seed.

VIII. The fourth, or Great Rocket of Florida. It has a considerable thick long Root Branching it self forth every way, from the Head above of fiery color, with a round white round Seeds, being somewhat robust in our Country, and containing a Gold color, and the Seed smaller, and much like to the former, with a few fine small Leaves, and a round white round Seed.

IX. The fifth, or Our more common Wild Rocket. It has a very long and pretty thick Root, with many Stems and Fibres adhering to it. It has longer and narrower Leaves, much more divided, and into slenderer cuts and pegs on both sides the middle Rib, than any of the former, and of a reddish green color, from among which rise several Stiff Stalks, two or three feet high sometimes, set with the like Leaves but smaller, and smaller upwards. Branched from the middle into several stiffer Stalks, bearing green yellow Flowers, consisting of four Leaves apiece, like the others, which afterwards give small long Pods, containing small reddish Seed, of a more bitter but being Tofe both than the others, or the Leaves also are.

X. The Sixth, or Lesser Wild Rocket With a small Flower. This in its Root, Stalks, &c. differs as much as the left, but only in the smallness of the Leaves, Branches, Flowers and Seeds, for in all parts is it lesser, and the Leaves are almost divided, but into smaller parts, not fmelling sweet.

XI. The seventh, or Blew Blowed Wild Rocket. Its Root is longer, slenderer and reddish, with some Fibres adhering to it. Its broad Leaves are cut in on both sides, something like Rocket, but in my opinion more like Groundsel. From among which rise up several hairy stiffer Stalks, freely a foot high, bearing rough hairy Leaves on them, less jagged, and some of them...
Chap. 598. English Herbs.

plan; the two half of them, viz., the ninth and tenth, grow frequently in our Nation in many wild Grounds, both near London, and up and down in the Country, in Sandy, Stony, Gravelly, and Chalky Barren Grounds, as in several places in Kent, at Shoots-bridge, upon Longfield Downs, which is a very Birren, Chalky, Hilly Ground: and at Greenshatch upon the Hills, and at other places in Kent. The ninth has also been found growing upon the Weeds in York-shires. The eleventh being a Foreign or Indian Plant, is found with us only in Gardens.

VII. The Qualities. They are all hot and dry in the third Degree, Aperitive, Affuasive, Attaative, Carminative, Colfmitic, Digestive, Directing, Suppurative, Phlegmatic, Nutriment, Scorbutic, Nepharic, Hefbic, Emmenumagic, Alchoharmic and Syphiparmac.<br>

XIII. The Specimenes. Rocket is good against the Sowvy, Strangury, Stone, Gravel, Stoppage of Urine, Rindings of Scurrina and other venomous Creatures, Ieping of Scorpions, reds Potions, is profitable against the Jaundice, Cough, obftrucition of the Spleen, Stoppage of the Terms in Women: is exceller over Athm's, and all obftrucions of the Lungs, and given cafe in the Gout, Scelatica, and other like pains of the Joints.

Where Note, The Wild Rockets, are strenghty and moft ufed in Phyfic; The Garden Rockets are of the same Nature, but weaker, and moft ufed in Sallets. The Battard Rockets, tho' they are of the same Nature, are yet weaker, and but very little ufed any where, where the others can be had.

The Virtue.

XXI. The Sallets of Garden Rocket. It is feldom eaten alone, but with other Herbs of a cooking Nature, as with Lettuce, Common Cabbage, and Roman, or with Purifense, either Garden or Wild, but it is in a manner wholly proper to a Condemn, or Sauce for Meat, to pleafe the Palate, far be the Appetite, and enufe a good Digestion: It admirably excites Seed, removes Inflammation and Fridge, and provokes to Veneral Adhes, but the Wild is more potent to this purpofe than the Garden, and therefore in the luft cafe is moft ufed.

XXII. The Liquid Juice. Reaping taken from a Spoonful to 2 or 3, mixed with Honey, and double Refined Sugar, and half a Pint of Generous Wine, Drink Early Morning and Evening, it powerfully provokes Urine and the Terms, cures the Strangury, and is probablie against the Stone, Gravel, Sand, or Tartarus Matter, or Slime, obftrucing the Reins, &c.

Letters
Salmon's Herbal.

Lib. I.

Urgers and Bladder. It is a wonderful thing for the Cure of the Scoury and Rheumatism in a cold habit of Body: and to quiet the Pain by the action of the Biting of Sarps, Vipers, Rattle-Snakes, Sting of Scorpions, &c. (A Cataplasm of the Green Herb being also applied to the place.) It is good against the obstructions of the Spleen, Vapors and Hydratitick itis, and is an excellent thing for the Colick, tho' never so extreme, and this upon the Spot, being also repeated as oft as need requires.

XXII. The Efficacy. It has all the Virtues of the Liquid Juice, besides which it is circular against Coughs, Colds, and all Obstructions of the Womb, Belly-aches, Gripings of the Gut, and also kills Worms in Children. Dose from half a Spoonfull to two Spoonfuls, in Wine, or other fit Vehicle, sweetened with the following Syrup of the Seed.

XXIV. The Infusion or Decoction of the Herb in Wine. It has all the Virtues of the Juice and Efficacy, but must be given in larger quantities, as from half a Quarter of a Pint, to almost half a Pint, Morning and Night, sweeted with the Syrup of the same Plant. It increases Seed (as do also in a more especial manner the Juice and Efficacy) is good against Impotency and Frigidity, and strongly provokes Lufif, exciting to Venerable Actions.

XXV. The Powder of the Seed. Mixed a Dram at a time with Honey or some proper Syrop, it encreaseth Seed, provokes Lufif, and cures Impotency. It kills Worms in Children, and has all the other Virtues of the Juice, Efficacy, and Infusion, Made into a Cataplasm with Ox Gall, and applied to the Face or other parts, it clears the Skin from Spots, Freckles, Tuning, Sun-burning, Yellowness, and other discoloring thereof, and cleans it from Scurf, Morphew and the like. Mixed or made up with Vinegar, it takes away Freckles and other Redness, happening in the Face or other parts, as also black and blow Spots, and the discolorings of the Small-Pox, retorting the Skin to its color again.

XXVI. The Infusion or Decoction of the Seed. It has all the Virtues of the Powder of the Seed, and of the Infusion or Decoction in Wine. It is a singular good thing for the Cure of the Scoury and Rheumatism in a cold Constitution, with all their appendent Symptoms; and is very profitable against the Colick, Gripings of the Guts, and inveaterate pains of the Stomach. Dose from a Quarter of a Pint to half a Pint Morning and Night.

XXVII. The Syrop. It is made with the Juice of the Herb, or with its Efficacy, by mixing an equal quantity of Clarified Honey therewith, or a Gentle Balsam or Sand-horn. It cures Althia's, Coughs, Cold, Wheezing, Hoarseness, throat, Breath, and other Dilempees of the Breth and Lungs, and is profitable against the Rickets in Children: and taken mixed with the Juice of the Earth, and an equal part of the Diluted Water, it increases Seed, as also Milk in Nurtres Breasts, is good against Impotency and Frigidity, and provokes Luft in both boxes. Being taken with half a Dram of the Powder of the Seed at a time, it kills Worms in Children, opens obstructions of the Spleen and Reins and Womb, provokes Urine and the Terms, and taken away the Biting or evil Smell of the Arm-Pits, and the strong Smell of the rest of the Body.

XXVIII. The Oil or Oleoem. They are Amody and Diflusive, good to diffuse Tumors, and cafe Pains arising from cold and moisture, or a Flux of Cold Humors to any part. They give effic in the Gout and Sciatica, and are profitable to be used in the Cure of the Palsy, Cramps, Convulsions, and the like.

XXIX. The Cataplasm. It may be made of the Green Herb, or of the Herb mixed with the Powder of the Seed. Applied to Wounds made by the bites of Mad Dogs, or of Serpents, as the Viper, Mattle-Snake, &c. or Hinging of Scorpions, it presently draws out the Poison or Venom, and prevents the Patient from the Scoury, and the дирк of Mad Dogs, to the Skin, it cleans it of any deformity, and takes away Scurf, Morphew, and other discolorings thereof.

XXX. The Gyneritch. Take of the Liquid Juice or Efficacy 6 Ounces, of Battle Gill made pure and fine, 6 Ounces, the half White Wine Vinegar 4 Ounces, mix them. It is good against Pimple, Pustules, and other breakings out, as also Freckles, Lentils, Scurf, Morphew, Tuning, Sun-burning, Yellowness, Tetter, Ringworms, and other deformities of the Skin, it being laid on Morning, Noon, and Night, after the Face has been well cleane with warm Water.

XXXI. The Diluted Water from the whole Plant. It has the Virtues of the Juice, Efficacy, and Infusion, but to a much lower or meaner degree: and therefore may be used as a Vehicle to convey the other Medicines down into the Body in. It is Cordial and Stormick, and withall Offermick, and therefore may be used against most of the Vices and deformities of the Body.

C H A P. D X C I X.

Of ROCKET Water and Sea.

I. T H E Names. It is called in Greek, "Eosunig "Eosunig in Latine, Eraca Polystrix: and in English, Water or March Rocket.

II. The Kinds. 1. Of the Water Rocket, called in Greek, "Eosunig "Eosunig in Latine, Eraca Aquatica; there is but one Species, which is here declared. 2. Of the Sea Rocket there is. 3. Eraca Maritima Varismus "Eosunig, &c. is called by Scopulis, "Eosunig, in English, Sea Rocket. 4. Eraca Maritima "Eosunig, &c. in English, Italian Sea Rocket.

The Descriptions.

III. The first, or Water Rocket. It has a long slender Stem, Full of Fibres, set as it were at Stains. Its Leaves are Subulata, so as to be upon the Ground, Burying on the same, with long Branches, of longer Winged Leaves, almost like to Stain Imperative, but not so much Scented upon the edges being half two or three dents for the most parts, and yellowish Flowers at the tops, with slender PODS following them.

IV. The second, the English Sea Rocket. It has a long slender Root with some few Fibres adjoining.
to is: from which spring up divers Stalks, some
trailing on the Ground, others Standing more upright, (but being Nurt up in Gardens, it some-
ting varies in its form and manner of growing in its
Stalks and Leaves.) those Stalks are Scattering
ly with small long Leaves, cut in or dent'd on the
edges like to Groundsel or Rocket but longer and
febrer, when growing in a Garden,) at the top of the
Stalks grow the Flowers of a pale purplish color,
the fashion of Radiolar Flowers composed of four
Leaves opposite: after which comes the Seed, in
form like to a Wheat Corn, but greater: which
Grains are something foonzy and not folid, are two
joined together, (when growing in a Garden,) but
every Seed single by its self, whereas that which
throws by the Sea-side, has always two growing to-
gether.

V. The third, or American and Italian Sea
Rocket. Its Root creeps under Ground, with fome
Springs or Fibres, and parasites every Year after it
has born its Seed. From this Root spring up long
and narrow Leaves, lying next the Ground, very
much and finely cut into several parts, not
very much unlike to a Deea Horse: the Stalk also is
very much spread out into many Branches, which are
also faw with the like Leaves, but fitter, and left
divided still up to the tops of each Arm. The
Flowers are of a purplish color, consisting of four
Leaves opposite, and fand one above another in fmall
Hurls each with two points, upon their felferal
Stalks or Branches. When they are falted and gone,
small pointed Heads in form like to a Spear's point
fucced, in every one of which is contained a white
Grain or Kernel.

VI. The Places. Theift grows oftentimes
near Ditches and Water-Courses, and sometimes
also in dryer places. The second growth on our
own Sea Coasts, in many places of Kent and
Suffex especially, yet is not proper to our Clime
only, but is found on the Sea Coasts of fere-
ral other Foreign Countries. The third has been
found about the Sea Coasts of Italy, near Venice,
and other places of thatShore: and in Travelling
I have sometimes found it upon the Sea Shores of
Florida, in and near our English Plantations.

VII. The Times. They all flower in June,
July, and Auguft, and their Seed is ripe within a
Month after the time of Flowering.

VIII. As to the Qualities, Specification, Prepara-
tions, and Farnce of this Plant, Authors have
faid nothing: but if we may presume to judge of
them by their Taste, which is very much like to
that of Rocket, we may predicate the fame of them.
However they are faid to be Animad, and Difur-
five, and that by a kind of Diaphoretick faculty,
they will dilfpeel Swellings and Inflammations.
Arquera fays, that Our English Sea Rocket
Purges exceedingly. Alfonus fays, it wonderfull-
ly cals the Cholick: and that the Distilled Water,
drank a Qunces at a time, gives admirable fale in
the Stone and Gravel, whether in the Reins or
Bladder.

CHAP. DC.

OF ROSE - WORT:

OR,

ROSE - ROOT.

I. THE Names. It is called in Græch, Ράςο
flor, in Latine, Rhodos radix, and Rosea
Radix (because of its Rofe like Smell:) and in En-
glifh, Rofe-Wort, Rofe-Root, and Rofe-Root.

II. The Kinds. Some have thought it to be a
Species of Orpinc, but that is doubtful. There
is according to Authors, two forts thereof, viz. 1.
Rhodos ferratus, Rhodos Radix fottis ferratis vel
dentatis, Rofe-Wort or Rofe-Root with felted
Leaves. 2. Rhodos non dentatis, vel ferratis;
Rhodos Radix fottis non ferratis vel dentatis, Rofe-
Wort, or Rofe Root with fmaln edged Leaves, or
Leaves not fented.

The Descriptions.

IIL The fift, or Rofe-Wort, or Rofe-Root with
fented Leaves. Its Root is black and Tuberous or
Knobby at the Head, and Branch'd out, rising oftentimes
above the Ground, whereas it grows some-
what reddish, and is long downwards, with divers
Fibres annexed to it, which being a little broken or
bruifed unfit it is fresh, finds much like to a
 DAMASK Rose, much more than when it is dry, the
then it retains a great deal of the Scent, and From
thence it was that it took its Name. From the
Heads.
Heads of this Root spring forth above Stalks, which grow upright, thick, round, or green, about a Foot thick, set with Leaves up to the tops, which are somewhat long and narrow, like unto those of Orpine, but smaller, yet as fat and thick, and of the like pale green color, whereby it much resembles Orpine in its Leaf, Flavour, and manner of growing. The Leaves are dented, about the edges. And the Flowers are many, small and yellow, set in a Vail, or Cloche, but something smaller than Orpine, with Seed in Heads like unto it also.

V. Gerard thus describes it: The upper end of the Root is thick and knobby, and grows for the most part out of the Ground, and is there of a purplish color, bunched and knobbled like the Root of Orpine, with many hairy Strings hanging thereon, of a pleasant Smell when it is broken, like that of the Damask-Rose, from whence it took its Name. From this Root spring forth many small, thick, and fat Stems, about which the Leaves are set round, even from the bottom to the top, like to those of the Field Orpine, but narrower, and more spindrift about the edges. The Flowers grow at the tops of the Stalks of a faint yellow color.

V. The second, or Roe-Wort, or Roe-Root, with Leaves not dented. This in its Root, Stalks, Leaves, Flowers, magnitude, and manner of growing, is much like the former, and scarcely at first sight to be dinstung from it, the only difference being in the Leaves, those being smooth, or even, and not dented on the edges, as the former are. And this it is which answers to the Cat which Matthiolus has given us in his Epitome of Dioscorides.
of \textbf{the ROSE-BUSH.}

I. \textbf{The Names.} It is called in Arabic, \\
Nord, Naron, Jowd: in Greek, \\
\textit{Pheas} in Latine, \textit{Rosa} and in English, \textit{the Rose}.

\textbf{The Descriptions.}

V. \textit{The first, or English White Rose.} This is \textit{of two Kinds}, the one \textit{the Greater} more thick and double than the other. The one \textit{rises up} in some places to be about 8 feet high, with a Stock of a great thickness for a Rose: it has some much smaller and whiter green Leaves than many of the other Kinds of Roses, five or six usually set on a Leaf, and more white underneath, as also a whiter

\begin{center}
\textbf{Rose Bush.}
\end{center}

\textit{green Barks}, armed with \textit{sharp Thorns or Prickles, by which it is easily known from other Roses.} The Flowers are white, with an Eye or Stare of a blue, especially towards the ground or bottom of the Flower; each is very thick, double and close set together, and for the most part opening it is so largely and fully as either the Red or Damask Rose.

V. \textit{The}
Salmon's Herbal. Lib. I.

V. The second Kind of the English White Rose. 

This kind grows higher than the Damask Rose, its leaves in magnitude, number and color are like the former, and the Buds in every manner armed with thorns, and opening if left thick and double, and opening if left more, some of the Flowers are so double, as not to have above two or three rows of Leaves, that they seem in some sort almost to be single, and having but little Smell. Some judge both these to be but one Kind, and make the difference to be occasioned from the Air, or Sun, but both: I confess I am not of that Opinion.

VI. Gerard gives us this general Description of our White Rose thus. Its Root is long, tough, and of a woody Substance, from which spring up very long Stalks, of a woody Substance also; set or armed with thorns. Here Proverbs, the Flowers are likewise full of Prickles, on which grow Winged Leaves, two in number for the most part set upon a middle Rib, by couples, the odd Leaf standing at the point, or end of the Same, every one of these Leaves being split about the edges, somewhat rough, and of an own green color. * From the Buds thereof shoot forth long Bent Stalks, on which grow very fine double Flowers, of a white color, and very sweet Smell, having in the middle a few yellow Threads or Chrust, which being soft, the Fruit succeeds (as large as a Rose Bean, or larger) which is of a longish round form (along coal) green at the first, afterwards of a shining Red color, with a red Pulp within, which when the Berry is ripe, is soft, and of a pleasant acid Taste: and within this Pulp is contained a good quantity of very sweet Alotter, almost like Hair, but short, within which the Seed or Grains ly hid, which are very hard almost, as Stones.

VII. The second, or Carnation Rose. It is in most things like unto the Last White Rose, both for the growing of the Stock, and size of the Flowers, but that it is more spread abroad when it is blown than the White is, and is of a pale blish color all the Flowers thick, and almost of the same Smell, as the final White One.

VIII. The third, or Dutch Rose. This sort is not very green, but very thick and double, and is very variable in its Flowers as also their color which will be different one from another. And the they may all of them be called Carnation Roses, yet some are paler than others, and some are as it were bluish, which comes not Commonly, but Naturally to this Rose. But the best Flowers (of which there will always be some) will be of a bright pale murrey color, near unto the Violet Rose, but nothing near of so dark a color.

IX. The fourth, or English Red Rose. We call this English, because it is more frequent in England than in other Countries. It never grows so high as the Damask Rose, but, more commonly grows low, and shoots forth many Branches from its Root (falled growing up as the Damask Rose into Standard) which Branches have a green Bark, Thorns for many Proverbs, and having larger Leaves, and greener on the upper side than the white, yet with an Eye of color upon them, five likeness for the most part set upon a stalk, and generally a little Whitish underneath. The Roses of this Kind do very much vary, according to their Sight and breeding, some of them are of an orient red, or of a deep crimson color, and very double, (after no double as the White) which when it is full blown, has the largest Leaves of any other Rose. Some of them again are paler, tending something to a Damask, and some are of so pale a red, as to resemble almost that of a Cannon Rose; yet all for the most part greater Leaves than the Damask Rose, and with many more yellow Threads in the middle. The Smell of this Red Rose is much better, or rather than that of the white, but not comparable to that of the Damask: but this Rose being well dried, and well kept, both in its color and Smell longer than the Damask, with the height looking after.

X. The fifth, or Damask Rose. The Damask Rose Ball is more regular, and a competent height to stand alone (which they call Standards) than any other Rose. The Buds both of the Stock and Branches, is not fully so green, as the Red or White Rose. The Leaves are green with an Eye of white upon them, so like unto the Red Rose, that there is no great difference between them, but that the Leaves of the Red Rose seem to be of a different color, a fine deep blish color, with some pale yellow Threads in the middle, but are not full so thick and double as the White, nor being blown, have they so great or large Leaves, as the Damask Rose; this Rose has great excellent fords pleasan Smell, for surpassing all other Roses or flowers, not being beady or too strong, nor flutting, or unpleasantly sweet in many other things are.

XI. The sixth, or Double Damask Province, or Holland Rose. This Rose has its branch of a brown reddish color, by which it is easy to be discerned from other Roses. The Leaves are also different on the others, and something larger, but it usually grows almost like to the Damask Rose, and much of the same height. The Flowers or Rose are of the same deep bluish color, that the Damask Roses are, or rather somewhat deeper, but much thicker, broader, and shorter, or fuller of Leaves by three parts almost, the outward Leaves turning themselves back, when the Branch is blown, but more long blown; the middle part is felt (which almost in all other Roses is to be seen) being folded hard with small Leaves, but scarcely any yellow at all visible. The Smell of this Rose comes nearest unto the Damask Rose, but not by much feet of it, the many do indeed think it as good as the Damask. And some have therefore caused their Damask Rose Stocks to be chilled with Province Roses, that they may grow more dense from them, than from Damask Roses, but truly (as I shall in what we shall) the Smell of it is not half so strong or so good.

XII. The seventh, or White Province Rose. The difference between this and the last is not very great. The Stock, and the Branches after, in this, do not seem so to be so green, but greener, and the Bark not so red. The Leaves are of the same largeness with the former Damask Province. The Flowers are not altogether so large, thick, and double, but of a little deeper Damask or bluish color, turning to a red Rose, but not coming up near to the full color of the deeper Red Rose: nor is the Smell altogether so strong or fierce, or not so the Damask Province, but coming something nearer to the Red Rose, yet exceeding it not, as it is pleasant in bearing as the last.

XIII. The eighth, or White Province Rose. It is very red and double, and very large like the Red Province Rose, or rather like to the double Damask, or Greater white English Rose, in the form and magnitude of the Rose, and manner of its growing, and in the length, in the Legencies of its Stock, or Rose, this being much the latter.

XIV. The ninth, or The Pary colored Rose, called the York and Lancaster. This in its form and
and order of its growing is nearest unto the Com-
mon Damask Rose, as well for its Body or Stem, as for its Branches, Leaves and Flowers. The
description of this, that the Flowers (being of the same magnitude and multiplicity or doubleness with that of the Damask Rose) has the one half of it, sometimes of a pale crimson color, but very much finer, and finer, and richer, as the other half, thicks, sometimes as such, the whole Flower is striped, or spotted over, and at other times, it has few or no stripes or marks at all, as Nature is pleased to vary it. But this is observable, that the longer it abides blown open in the Sun, the paler, and the newer Stripes, Marks, or Spots, it will lose, it has the Smell of a Damask Rose, but weaker.

XV. The tenth, or the Crystal Rose. This is very like to the last described, both for Stalk, Branch, and Leaf. The Flower hereof is not so much different from it, as being so great, large or double Rose, but the meaner, pale, and marked with a deeper blue, or red, upon the pale colored Leaf, so that it seems in the marking and beauty thereof, to be as plain, and white as the Crystal Gilliflower. This even at the former does, from fades and falls away, not yielding any great number of Flowers any Year.

XVI. The eleventh, or Dwarf Red Rose, or Gilliflower Rose. This always grows low and small, otherwise in most respects it is like unto the Common Red Rose, and with few or no Prickles upon it: The Flowers or Roses are double, thick, small, and close, and so much spread open at the Ordinary Red, but somewhat like unto the first Double white Rose, before describ'd. But in some Gardens they blow more open, and are as even at the tips of the Leaves as if they had been clips'd off with a pair of Scissors, and are not of so full a red color as the Red Province Rose, but of as neat, and poor a Smell as the Common Red Rose, or rather weaker.

XVII. The twelfth, or Frankfort Rose. The young Shoots of this Rose are covered with a pale greenish Bark, for with a good number of small Prickles like Hairs, and the elder have but very few Thorns. The Rose has a very great red or crimson color, greater than in any other Rose, and is thick and double as a Red Rose, but so very much flourishing in the Bud, that many of them break before they can be fully blown, and then they are of a pale Red Rose color, viz. between a Red and a Damask, with a very thick, hard, and hard Umbone or Petal, and short yellow Threads or Thorns in the middle, the Bark of the Flower has long ends, which are called the Beards of the Roses, which in all others, are jagged in some of them, but in this has no Jags at all. The Smell thereof is nearest to that of the Red Rose.

XVIII. The thirteenth, or Hungarian Rose. This has green Shoots which are set with many Prickles, and seldom grows higher than the Common Red Rose, the Stem or Stock being much about that high-
ness. The Rose is as thick, great, and double, as the Common Red Rose, and is of a rich, fine, of a pale red color, and being nearly half open, is finely spotted, with faint Spots, as it were spread over the red, the Smell of which is something stronger than the Smell of the Red Rose of the self Kind.

XIX. The fourteenth, or Single Velvet Rose. The old Stock or Stem of the Velvet Rose is covered with a dark colored Bark, and the young Shoots with a fair green, with very few or almost no Prickles upon them. The Leaves are of a fad-
derly green color, thin in most parts of Roses, and the commoner often seen on a Stalk, many of the red having but fine. The Rose is single, and when blown, is a broad spread Flower, consisting of five or six broad Leaved, with many yellow Threads in the middle.

XX. The fiftenth, or Double Velvet Rose. The Stock, Bark and Leaves of this are like those of the Single Kind. The Flower or Rose is double, and has two rows of Leaves, the one large, which are outermost, the other smaller within, of a very deep red crimson color, like unto Crimson Velvet, with many yellow Threads all in the middle, and yet for all the double rows of Leaves, these Roses seem but like single Flowers.

XXI. There is another Double Velvet Rose, much more double than the last, consisting oftentimes of 18 Leaves or more in a Rose, and so of them of an equal bigness, of the color of the fold Single Velvet Rose, at Sec. 19. above, or something brighter, but all of them a weaker Smell than the Common Red Rose.

XXII. The sixteenth, or Rose without Thorns or Prickles single. This has several green smooth Shoots rising up from its Root, without any Thorns or Prickles at all upon them, neither wild if they are young, nor whilest they are all. The Leaves are not fully so large as those of the Red Rose. The Roses are not much bigger than those of the Double common Rose, they are not fully full, but short, and of a pale red or like color, with fewers pale colored Veins, third every Leaf of the Flower, which has caused it to be called the Milky. The Marbled Rose. It has but little Smell, not full but so strong at that of the Red Rose.

Roses Bath without Prickles.

XXIII. The seventeenth, or Double Rose without
Thorns. This is in its Shoots, Stalks, Branches, Leaves and Buds, as well in its form and manner of growing, as altogether like the former, and dif-
ers from it only in its Flower. For in this, the Rose (which is a little larger also than the Double Crimson Rose) has no Leaves thick set together, and it very fall of them, short at the end of the same pale red color, with pale colored Veins running through every Leaf thereof, the duplicity of the Rose making the chief difference from the former.
Salmon's Herbal.  

XXIV. The eighteenth, or Single Cinnamon Rose. This has its Shoots something red, yet not so red as the Double Kind. adorned with green Prickles, almost like those of the Eglantine Bush; and they are covered, as well by the multiplicity of its Shoots, as by the quickness of its growing, and the height of its Stem, its original Nature, which seems to be of a Wild Kind originally. On the Stem and Branches grow winged Leaves, sometimes green or more together, which are small and green, yet like unto other Roses, which are single, confiding of few Leaves apiece. something large and of a pale red color.

XXV. The nineteenth, or Double Cinnamon Rose. This in its Stem, Branches, Leaves, Buds, color, and form of growing is altogether like the Single Cinnamon Rose, and differs chiefly in the doubleness of its Flowers, but in this the Shoots are redder, and it bears fewer, short, thick and double Roses, something like unto the Rose without Thorns or Prickles, but a little fewer, of a paler red color at the ends of the Leaves, and something redder and brighter towards the middle with many Shoots arising about the center of the Flower. The Smell both of this and of the Single Kind, is that of Cinamon, from whence came the Name.

XXVI. The twentieth, or Single yellow Rose. This is Planted rather for beauty than anything else. It is ten feet to a good height, its Stem being green and Woody, with few or no Prickles upon the old Woods, but with a great number of small Prickles thence, and thickly set upon the younger Branches, of a dark color, sometimes reddish, and the Bark of the young Shoots being of a pale green reddish color. The Leaves of this Rose Bush are smaller, rounder pointed, of a paler green color, finely Jutted about the edges, and more in number upon each middle Rib, viz. seven or nine, and happen. It bears a small single Rose, confiding of five Leaves, not so large as the Single Spanish, Musk Rose, but larger than the Eglantine, or Sweet Briar Rose, and of a fine pale yellow color, without any great Smell whisth flesh, but a little more (the very mark) when it is dry.

XXVII. The twenty first, or Double yellow Rose. This Rose, by reason of its Rarity, and exceeding doubleness of its Flower, had it but one or two Orange Smell offs, would have been one of those which might have obtained the highest Elenor. In the Stem or Stalk, the young Shoots or Branches, the small bony Prickles, and the small winged Leaves, it is altogether like unto the former Single Kind. The chief difference consists in the duplicity, or rather multiplicity of the Leaves of the Flower or Rose, which is so thick and double, that very often it breaks out on one side or another, so that few of them abide fair and whole when in our Gardens. The cause of which is suppos'd to be the too great sun, or severity of our Air or Weather, in the time of their flowering, too much Rain burning them, besides it is plentiful in young Shoots or Branches, as also in Flowers at the top of every Branch, which for the most part, are small and weak, that it is not able to bring all its Flowers to perfection, and therefore most of them fall or rather very without coming to ripeness. The Remedy which many use for this inconvenience is, to nip up most of the Buds, leaving but some few upon a Branch, that so the vigor of the Plant may be collected into a few Flowers, and so the more easily come to their perfect beauty, which yet very often is with difficulty affected. The Roses are of a yeollowish green color in the Bud, and before they are blown open, but afterwards when fully blown, are of a fair yellow color, very full of Leaves, with many short Hairs rather than Leaves in the middle, and banning short, round, green, and thorny Barbs or Hooks, almost that under them. The Flower being fully blown open, does freely give place for largeness, thickness, and doubleness, unto the Great double Damask Province, or Holland Rose. This Rose Bush or Plant is very tender with us here about London, and requires more care than the Single Kind does, which is hardy enough. But it bears very well in a warm, dry and free Air, and that in all or most parts of the Kingdom, more especially if it is planted against a Wall, or be other ways defended from Rain and Wind by covering it.

XXVIII. The twenty second, or single Musk Rose. It rises up often times to a very great height, so as to over grow any Arbor in a Garden, or being set by an house side, will rise up to ten or twelve feet or more, with many green fur forced Branches, armed with a few sharp and great Prickles, such as the wild sorts of Roses base. The Leaves are Small kind of a dark green color, not much bigger than the Leaves of Eglantine. The Flowers come forth at the tops of the Branches, many together, as it were in a Tusfe, which for the most part do Flower all at a time, or not long one after another, every one flaming on a pretty long, forked, white, or of a pale whitish, or Cream color. The Roses are small, confiding of five Leaves apiece, with many Yellow Threads in the middle.

XXIX. The twenty third, or Double Musk Rose. This in its Stalks, Stems, Branches, Leaves, height, and manner of growing, is exactly like the former Single Kind, by the chief difference between them is in the Flowers, which in this are double, and of the same pale white, or Cream color, as the Single Sort. The Roses are furnished with two or three rows of Leaves, with yellow Threads off in the middle. Both the Single and Double Kind have a very smooth and pleasing Smell, very much resembling Almack.

XXX. The twenty fourth, or double white Damask Musk Rose. This is more truly may be called the Double white Cinnamon Rose, from its Smell. It has its Stem and Branches shorter than the former, but as green. The Leaves are somewhatarger, and of a whiter green color,—and all its other Prickles, and its other Roses are also something larger than the former Double Kind, at Sect. 29, above, but flung in Tufes after the same manner, or something thicker, and of the same whitish color or a little more double, and something, also but little, near the Smell of the last described, but nothing so strong. These Flowers at the times of other Roses, or rather later, yet much before the two former sorts of Musk Roses, which Flower not till the end of Summer, or in Autumn; both which things as to time of flowering and Smell, show that it cannot be of the Species of the Musk Roses.

XXXI. The twenty fifth, or Single Spanish Musk Rose. This rises up to the height of the Eglantine, and sometimes higher, with several great green Branches, the Leaves of which are larger, and greener than any of the former Kinds of Mask Roses. The Flowers are Single Roses, consisting of five white Leaves, either than any of the former Musk Roses, and much larger, having sometimes an Eye of bluish in the white, of a very sweet Smell, coming nearest unto the last sort, at Sect. 35, as also for its time of flowering.

XXXII. The twenty sixth, or Single sweet Eglantine, or Sweet Briar Rose. This is well known for the fruitfulness of its Leaves, as is Planted almost in all Gardens, yet found growing Wild in many Woods and Hedge. It has exceed-
XI. The Refers. The Common Riff is for the mild part the earliest; The Common Mark Refer to both single and double, Flower first; all the others Flower much about one time, once from the beginning of June, and all July till August, and the Red, many times through the whole Month of August, even till September.

XII. The most effeicient of all these are, 1. Of the Red Refer, the Rosa Mundi, Red Belcher, and the Riff without Thorns. II. Of the Damask Refer, the Crayfial, the Beautiful Variegated Damask Rose, the Blufh Belcher, the Monthly Rose, and the Damask Provence Rose. III. Of the Yellow Rose, the Scarlet Austrian Rose, and the Double yellow Rose. IV. Of the White Refer, the Blufh white Rose, and the Damask Mundi Rose. There are all excellent Refer, and more of them ought to be wanting in any good Flower Garde.

Of the Planting and Nursing up of Refer.

XIII. Note 1. All sorts of Refer are hardy, and will endure the Froiz in Winter, and the houer the Soil is you let them in, the better they will thrive, and the latter will be the Flowers. They are generally diploid in Rifs and Hedges, and supported and kept in on both sides. And but several colored Refer, intermix and well placed will make an excellent and beautiful Prospel.

XIII. Note 2. All Sticks of Budded Refer are to be carefully kept from Suckers. If the Buds be placed near the Ground, after one years growth, they may be laid in the Earth to Root, by which means it will become a natural Bud, one of which is more worth than the other. Then will be budded, for that every Sucker which comes from them will be the same Kind, by which they will be encreaffed. But all Riff Budders are not apt to yield Suckers, it will therefore be the speedest and snuff certain way to lay down the Branches, or make Layers of them, and to put old well rotted Dung about the places where they are laid, which will make them take Root the sooner.

XIV. Note 3. There are some Refer which are not fit to be Planted in Hedges, as the Mark Refer; which will not Bear at all, unless they grow by some high Wall, or rise flat, where they may have liberty to grow to their full height, which is commonly eight or nine Feet high. Also the Double Teffle, which is the most usual of all others to bear kindly, and fair Flowers, except it be ordered and taken care of in an especial manner; for whereas all other Refer are left natural, this proves best being inoculated upon another Stock. And whilst others thrive and bear height in the Sun, this thrives best in the Shade.
Salmon's Herbal

Lib. I.

put into a Bath of the Double yellow Rose, which growing, the Scurfes must be kept from the Root, and all the Buds rubbed off, except those of the kind desired, which being grown big enough to be cut (which will be in two Years) it must in Winter be pulled very near, cutting off all the Smaller Shoots, and only leaving the biggest, cutting off the tops of them also, as far as they are small.

XLVI. Note 5. Then the next Spring, when the Buds for Leaves come forth, rub off the smallest of them, leaving only those few of the largest, which by reason of the Strength of the Stock, affords more nutriment than any other; and by the agreeable Nature of the Single yellow Rose, from whence it is immediately nourished, the Shoots will be strong and able to bear out the Flowers, if they be not too many, which may be prevented by nipping off the smallest Buds for Flowers, leaving only both a number of the largest, as the Buds may be able to bring to perfection, which Buds should find something had, and not too much in the heart of the Soil, and in a Salve the Readier to flower, rather than under a Wall.

XLVII. Note 6. Rofes are also evaporated either by evaporating the Buds of them into other Stocks, or by drying them on the Branches in the Earth, as before hinted. The last Stocks to be evaporated upon, are 1. The Damask. 2. The White.

3. The buftread. 4. And the Wild Chintz. The Ripe time to do it is, about Missouer, or as soon as good Buds can be gotten.

XLVIII. Note 7. After your Rose Buds have done Bearing, they ought to be cut with the Garden Shears, something near, and towards the Spring, each Branch is to be cut again with a Knitting Sheaf to a Lear Buds, and what is dead or Superfluous is to be taken away. These Buds being ordered, you may expect to reap a plentiful Crop, and to obtain every Year, a good Store of very Fine Rofes, when many times those which are Natural, may notwithstanding all the helps of Industry, prove poor and mean or bladed.

XLIX. Note 8. The parts of the Rose if full, have also several particular Names, as 1. Vöhren, which are the Shoots of the Rose Plants, as Strafo Gullar, in his Little Garden is pleased to call them.

2. Rofen, are the Tops of the Cup which are closely cut, and which compose the Flower calyx, short before it is opened, which be in number five, two of which have Beards, and two have none, and the fifth has but half one. 3. Dak, or the Cup it self, which contains and holds in together the yellow Part, and the Lews of the Flower.

4. Leuger, or the Nails, which are the lower parts, of the Leaves of the Flowers, by which they are joined to the Caps. 5. Amboth, in Shops Amboths, Fat Rofa, The Flower of the Rose, or the middle part therof, which they call the Calyx, and some (who oddly) the Seeds of the Rose. 6. Pöldin, Calathum, the Hop or Fruit, which comes after the Rose, and which being ripe is of a bright shining Coral like color.

L. The Qualities. Rofes lays, that the Rose is cold in the first Degree, and dry in the second. Both the White and Red are cooling and drying, but the White is taken to exceed the Red in both Properties. Golden Lays, the Red has a bitter and astringent Quality with it, and that the Amboth or yellow Threads in the middle of the Rose, do bind more than the Rose itself, and are more drying stile. Melrose will have the Rofe to be composed of divers parts or Substances, viz. of a Watery temperate Substance, of Earthly Drying Parts and of a Volatile Aromatic Substance, which is hot, whereas comes its Redness, Perfection and Forma. The Bitterness in the Rose, viz. Damask, and also when they are fresh, prove their Cathartic Quality, and makes them to purge both Cholerick and Watery Humors, which it does not appear that the Greeks knew any thing of, but being dry, that stirs the vitals, and therewith their purging property, and then they have only an astringent, binding or stopping Power. Those which are not full blown, do both cool and bind, more than those which in full blow, and the White more than the Red, and the Red more than the Damask or Musk Kinds. All the Musk Rofes both Single and Double, do Purge more powerfully than the others, and the Single Rofes are held to be stronger than the Double, tho' none of the Greeks have taken notice hereof, but Meeser the Arabian only. And Comac巡查cies, that so Leaves of the Single Musk Rose, will open the Bally, and Purge the Body, but more are to be taken of the Double Kind, to do the same.

LI. The Specification. The White and Red, Rop Flames of the Bowels, and Catarrhs, are Valently, drying and healing, good against Contusions and Ulcers of the Lungs, as also internal Ulcers of the other Viscera, as of the Stomach, Guns, Reins, Bladder, and Womb, comfort the Spleen, and also against Cold, and all Dificies allaying those Parts, proceeding from cold and moisture.

The Virtues.

LIII. The Liquid Juice of Red Rofes. It strengthens the Stomach, Heart, Liver, and Restorative Faculty, helps the overflowing of the Whites and Courtes in Women, Defeations of Rheum into the Eyes, and all sorts of Fluxes of
The Bowels, as also Ulcers of the Lungs, Guts, Reins, Bladder, and Womb. Dose 2 or 3 Spoonfuls Morning and Night, in a Glass of Red Steph- 

ick Wine.

The Juice of Damask and Musk Roses. It has in it a great moisture the Virtues of the Red, besides which it purges and cleanses the Body of cholick and fepticick Humors; eases pains arising from heat, allays Infcriptions, and eases Cick and Sleep. It also gives eafe in the Colic, by purging off the acrimoines and thump Humors which cause it.

The Effence of Damask and Musk Roses. It has all the Virtues of the Liquor Juice, Works quickly and eafily, and may be given Morning and Night, from 2 Spoonfuls to 4, in a Glass of warm White Port Wine, or in Poffler Drink, or Water- 

Groat, or Mutton Broth.

The Decoction of Red Roses in Wine. It is very good against the Head-ach, and pain in the Eyes, Ears, Throat and Gums; as also the Infelicit- 

ity Pethan and Worms, being injected into the Mouth, or parts bathed therewith. Taken 

inward, it is good to give eafe in the feemfeffing Pains of the Colic. In this Left Cafe, I am of Opinion the Infufion would be better eafseful for the Sickness than in Wine.

The Infufion of Damask or Musk Roses in Wine. It purges and cleanses the Bowels, and whole Body, from Cick, Poffler, and Vifcom, 

T offers it very convenient, and therefore is profitable against the Griping of the Guts, Colic, or dry Belly-ach, Stone, Gout, or other like Di- 

feases, proceeding from those Humors.

The Decoction of the Rose. It may be made in White Port Wine, or in Water, or in an equal mixture ofthese two. It is of good ufe against Spitting or Vomiting of Blood, flowing Blood, or the Bloody Piss, and all other Fluxes of the Bowels.

The Simple Syrup of Red Roses. It is made altogether as you make Syrup of Globefhills, 

flowers, in a boiling bafes. As of you please, in 

feed of Water, you may use a strong Syrup's part of 

Red Wine, at Alicante, Barcelona, or Barubar 

 Wine, &c. It stops all manner of Fluxes of Blood by Moon, Uterine parts, Womb, and Fundament, 

fiood Blood in Men, and the Whites in Women, is good against nauf- 

ioutis and Vomiting, and profitable against Coughs, Colds, and Catarhies. Dose a quarter of a Pint every two or three times a day.

The Syrup of dry Red Roses. Take 

Spring Water 4 Pints, let it boil, and then infufe in 

it, some at a time, of dry Red Roses 6 Ounces; the next day profe them out, and with 2 Bounds of Sugar, make a Syrup by boiling according to Art. It conferts and Strengthens the Heart and Spirits, 

binds, stops Fluxes, Roses Vomiting, and has all the Virtues of the former made of the fresh gathered 

Roses.

Syrupus s facero Reformationis Damascenarum, 

Syrup of the Juice of Damask Roses. It is prepared without Distillation, only with the Jace of 

Damask, or of Musk Roses pleded out and Clarifi- 

ed, with an equal proportion of Sugar. It purges 

Cick, Poffler, and wetter Humors, which it does 

without any Violence, cools, and also Strengthens the Bowels. It is a foleritum Syrup, familiar, safe, and gen- 

tle, good against the Colick or dry Belly-ach, be- 

ing given from 1 Ounce to 3, or 4 Ounces at a time, in a Glass of Water.

The Syrupus Reformationis Orientalus, Sweet or perf- 

fumed Syrup of Roses. It is made of the Diffufed 

Water of Red Rose Leaves one part, with treble 

reafon Sugar 2 parts, making them into a 

Syrop in B. M. to which is added some few Grains of prepared Musk and Ambragefe. It is refrigerating, cordial and Strengthening, and used as a Ve- 

hicle to convey other Medicines. Dose 1 Dose in the Eyes 4 or 5 times a day, it cleans the Sight, and takes off Clouds, Mists, Blood-flot, &c. It is many times used with Garnetim, Wallaces, and Infections, instead of Honey of Roses, to pull out 

cleanfe, and heal old Sores, running Ulcers, Euflua- 

fas, &c. The best way to perfume it, will be, 

by adding to every Pint of the Syrup, 3 Drops or more of the Tincture of the Syrupus, and not the Perfumes in Subfufence. It will be best to be given without being Perfumed, especially if 

they be apt to have Vapors, Hyfterick Cries, &c.

Syrupus Damascenus et Musk Roseus. It is made of the Leaves of Damask and Musk Roses in equal Quantities, exactly, as you make the Syrup of Roses foleritum fimple in the next Session. It purges 

admirably well, and yet with gentleness or eafiness, and is peculiar against the Colick or dry Belly- 

ach, and the vehement of the cholick Fermentation.

Dose from 1 Ounce to 2, in any proper Vehicle.

Syrupus Refolus foleritium simplex, Syrup of Roses foleritum simple. Take Spring 

Water boiling for 1 Quarter 3 Damask Rose Leaves 

fresh, as many as the Water will contain, distill in 

5 Prefs elfe; let it 12 Hours: then profe them out, and put in fresh Rose Leaves as many as before, 

the Water being warmed anew; repeat this again, 

3 or 4 times, evaporating the quantity of the Roses, or the Liquor evaporated, which will be by about a third 

part, every time. Take of the Liquor three parts: 

double equal Sugar two parts: mix and make a 

Syrop in Balsamo. It purge Choler, Poffler and 

wetter Humors, gently and eafily, cools and fortifies the Belly, expels Poffler out of the Stomach, and 

has all the Virtues of the Syrupus facero at full. 

65 going away, you may give from 1 to 4 Ounces 

of it at a time, according to age and Strength, in 

Clarified Whey, Sack Whey, Poffler Drink, Mutter 

Broth, &c.

Syropus Refolus foleritium cum Agarica, Syrop of Roses foleritum with Agric. Take A- 

garic every 6th oxed 2 Ounces, Ginger very thin 

thick 8 Ounces, Agarick, any Sugar, 5 Pints 

mean, 4 Pints, Polypody, crufbly bruifed 4 Ounces, friveble them with White Wine: Difg to them 2 Days over warm After, or 

S. heat, in an Infufion of Damask Roses 2 Pounds; expref the liquor, and while Sugar 1 Pound, boil into a Syrop according to Art. It is stronger and more effectual in Working than the 

simple Syrup, for one Ounce thinned by it 1/3, 

will open the Body more than 4 Ounces of the 

other, and Works as much on Poffler and Water, 

as on Choler. It cleanses the Stomach and Liver of Choler, provokes Urine, refrecifies the Stomach, 

and Poffler Vomiting. Dose from an Ounce to 3. 

Ounces. If you would have the Syrop more effectual, it will be best to take Agric 2 Ounces, 

and to make into a Syrop with Sugar thry, till you 

load the force of the Agric by boiling. Polypody, 

crufbly bruifed 3 Ounces, Soda 3 Ounces; made a Syrop, and added it a Syrop of Sugar to it, 

then distill it elfe till about 1 Pint remain. The remainder with the Ingredients reafonf eadily, and charfe it with wafers of Eggs. 

Afterwards take Syropus facero at full.

Syropus Refolus foleritium cum Hellboro, 

Syrop of Roses foleritum with Hellbor. Take the 

Roots of all the Myrobalanes, of each 6 Ounces, 

Ephedra, Polypody, of each 5 Ounces; the Syrupus facero 4 Ounces; Soda of Chrom 2 Ounces, Choes 

2 Ounces, cut and eafily bruifed them, put them into 

a Glass Cufhoup, upon which add the of the above 

mentioned Infufion of Damask Roses 2 Pounds, 

distill 24 Hours, and then Distill elfe till about 3 

Pints remain. The remainder with the Ingredients eafilyf ead, and charfe it with wafers of Eggs. 

Afterwards take Syropus facero at full.

Chap. 601. English Herbs. 597
Helichor & Drums, Rheumbarb, 2 Ounces being pre-
pared, Extract with the before Distilled Water, by
a double or triple Infusion or Collins, and express
ning, which with the afore defined Liquor, and
five Sugar Candles 5 Pounds, make a Syrup in Bal-
ance, according to Art. It opens obstructions of both
Liver and Spleen, and prevails against Melancholy,
Frenzy and Madness. Dose from 1 Ounce to 2 or
more, at a time in Clarified Whey, or Bronge or
Fountain Water. It is best to be taken in a smaller
Dose, in Toffee.

LXVII. Syrupus Resarum solum, from Sena.
Syrup of Roses liquid, with Sena. Take feme
Ounces, Convolvum and Sweet Vernal Seed, of each
half an Ounce; prepare them with White Wine,
and digest them two days, in the afore mentioned in-
fusion of Damask Roses 2 Quarters, then strain out
and add white Sugar two Pounds, boil it into a
Syrup. It is an excellent thing to purge Melan-
choly, open obstructions and ease pains of the
Spiken, Wind, Etc. and all Difficulties proceeding
from these Causes: it eases the Head and Heart,
combats the heat, revives the Spirits, and
prevents against the Green-sickness in Virgins,
Dose from 1 Ounce to 3, in a weak Infusion of
Sena in Clarified Whey, or White Wine.

LXXXIV. Trinitura Reformatam, Triniture of
Roses. Take Rose water 2 Quarters, reduced
Oil of Saltpetre a Draft, and Julep of Roses.
It is a piercing and cooling Nature, clearing the
Head and reviving Sweats, good against FEVERS,
and Soothing. If a few Drops of Oil of Saltpetre are
added to it, it will make it much the grateful
and much the more cooling.

LXIX. Jandelius Rofatum, Julep of Roses.
It is prepared of Damask Rose Water, in the fame
manner as the former Cardinal Julep. It has all
the Virtues of the former, comforts the Head,
Brain and Animal Spirits, behoves which it is said
to be binding, and to stop all Sorts of Fluxes of the
Bowels. And if it is prepnagated with some
few Drops of Oil of Saltpetre, it effectually stops
Vomiting, and expedites all Burning and Malig
Fever.

LXX. Mel Rosarum Concursus, The common
Honey of Roses. Take Red Roses not quite open
2 Pounds, Honey 2 Pounds; stir them in the Sun
according to Art. Or thus. Take of the manufac-
tured Infusion of red Roses 3 Pints, clarified Honey
2 Pints; mix and boil to the thickness of Honey.
It thickens the Stomach, behoves in feebled and
Ulcers of the Eyes, cleanses and heals Ulcers of the
Month and Throat, as also Ulcers in the Secret
parts of Man or Woman, and is said in Cyterns
to heal Ulcers of the Gun, being diffused in Milk
or Beer.

LXXI. Mel Rosarum colatum, Honey of Roses
strained. Take Honey displaced in Bal-
ance 1 Pounds, Juice of Red Roses 1 Pounds, stir them
conveniently over the Fire, and when they begin
to boil, put in fresh Red Roses (the Whites being cut
off) 2 Pounds, confuse the Juice by boiling and
filtering, then strain out, and keep it for use. The
Viruses and Life of this, are altogether the same
with the former. It is sometimes mixed with In-
fection for the cure of a Consumption, and other
Venereal Ulcers.

LXXII. Mel Rosarum solum: Honey of
Roses liquid. Take of the manufactured Infusions of
Damask Roses 3 Pints: Honey well clarified 2
Pounds; mix and boil them to the thickness of-
Honey. This has all the Viruses of the former
Honey. But behoves being taken inwardly, from
1 Ounce to 3 (according to Age, Accidents, Etc.)

It Works genedy and safely, makes the Belly solu-
ble, and purges off Choler, Phlegm, and Watery
Ulcera. If a Draft prepared with Sugar 3 Ounces, Species Diarrhoe-
abs 3 Ounces, Fine Bole, Juice of Liquorice, of each a
Draft, Saltpetre a Draft, Flower of Benjamin
Capsicum, a Mixture of each half a
Draft, Amphitrichum of Saltpetre a
Draft, Osmatriz Oil or Spirits of Roses 3 Grains, and
with some Yellow Syrup make a Loche. It is good
to apply it to all Sorts of Ulcers of the Heart,
Dose the quantity of a Crat-New.
LXXXVIII. Confervus of Damask Roses. Take from Damask the leaves being cut off a Pound, beat them in a Mortar to a Pulp, adding a double portion of Sugar, and boil them in a double portion of Water, but the Aperientic virtue is of a much better way of doing it, which is by putting them through a Mill, which makes the Mops or Confection smooth and uniform. It generally covers the Belly and Purges, and has the Virtues of the Syrup of Damask Roses, but is well gned with more earthy parts, and therefore binds after it has done purging.

LXXIX. Damask Roses Prepar'd. It is done either by laying the Flowers, Strewn aperient, with double refined Sugar, and a double quantity of Sugar: Or by making the double quanti-

LXXXIII. Altro Resitas, Redef. Alces. Take Alces Succiniteria and clear, which reduce into Powder, 4 Ounces. Juice of Damask Roses depa-

LXXXIV. Powder of Red Roses. It strengthens the Heart, Stomach, and Liver, fortifies the sensitive Faculty, eases pain from a hot Cause, allays inflammations, induces Rest and Sleep, stops the Whites and Tears in Women, all Fluxes of the Belly, and helps a Ganorhema in Men. Doke a Dram, or more, in Syrup of Red Roses, or made up into Pills with Closer Turpentine, to be taken at Night going to Bed. It is (so far) probably also against Ulcers of the Reins, Ureteres, and Badder.

LXXXV. Aetheration Refutum, The Rose Aromatique. Take Red Roses equal to 5 Drams, Liquorice 7 Drams, Xylolamines, Yellow Sanders, of each 3 Drams, Canum 5 Drams: Cloves, Mace, of each 2 Drams and half, Gum Arabic, Tragacanth of each 2 and half, Nar-

LXXXVIII. The Powder of Damask and Mace 

LXXXIX.
Salmon's Herbal. Lib. I.

LXXXIX. The dried Leaves of Damask and Red Roses. The dried Leaves of the Damask and Musk Roses serve chiefly for Sweet Bags. But if they be mixed with their Infusion in Clarified Water, or White Port Wine, gently open and purge the Body, more especially if it be dulled with Humors, or Syrup of Rosa. The Dried Leaves of the Red Roses are used in Devotions and Infusions, both inwardly and outwardly, as a Cordial, and to cool, strengthen, stop Fluxes of the Bowels, and to chase the Colic.

XC. The Rose Cake. If it is moistened with Vinegar of Roses, or with Vinegar of Roses mixed with Rose Water, and cut to the place it is to be applied to, it is cold to ease the Head-sick, and unquietness thereof, and to procure Rest and Sleep.

XCI. The Epileptic. Take 1 & 1/4 Pounds of Vinegar of Roses, either fresh or dried, moisten them with Vinegar of Roses, after they have been a little heat between a double folded Cloth or Paper in a Frying Pan, or before the Fire, then steep them upon them a little Grated, Ipecacuan and Boga Seed, so that those who are very near the Skin, and apply it to the fore-head and Temples, and to bind it on all Night, it eases the Head of Pain, and cures Rest, and quenches Sleep.

XCII. Olean Rosarium Omphacium, Oil of Roses Omphacine. Take Rose Knees exsiccated not yet ripe, and bruised in a Stone Mortar with a Wooden Pestle, a Quarter of an Ounce, Oil Omphacine several times washed a Pound; mix, and expell them in a Glafs close Flask, to the Sun for a whole Week, shaking them every Day, then boil them gently in Water, press them out, and put in fresh Roses, doing in like manner, and repeat a third time, and keep the Oil upon one Pound of Juice of Roses. It cools and strengthens, and eases pain proceeding from a hot Climate; it stops the Flux of Humors, cools the Head, Stomach, and Joints, and extinguishes an Erysipelas.

XCII. Olean Rosarium compleatum, Oil of Roses compleat. A mix made in the same manner of Juice and newer Oil Omphacine, often washed, and Red Roses, daily blown, bruised, and set in the Sun, and gently boiled in Balneus, taking the third Infusion spread in the Sun forty Days, and then to keep the Oil and Roses together without Expiration. It is Anodyne, Emmollient, and Arthritis, and has the Virtues of the former, but is lasting Cooling and binding.

XCIII. Aquantam Rosarium, Ointment of Roses. Take fresh Roses Lord, cleansed and well washed, a Pound, fresh Red Roses a Pound, mix and diget 7 Days, then boil with a gentle Fire, and strain out. Repeate the same Work with fresh Roses, bruised, for 7 Days more, then boil and strain out as before. At length affaye Juice of Red Roses half a Pint; Oil of Scotch Almonds 2 Ounces, boil them with a gentle Fire to the consumption of the Juice; strain out, and make an Ointment according to Art. It is Anodyne, cooling, and refreshing; it strengthens weak, painful, and wearied Limbs, heals cuts, and blisters, and relieves the Skin, angry Pustules, aches, Tumors, Rheums, and clears the Head, and other parts from Scarify, Morphew, and other like Locust Deformities: having all the Virtues of both the Oil of Roses.

XCIV. The Capofpin. It is made of fresh Red Roses beaten to a Pulp, and either boiled fast with Vinegar of Roses, or not boiled, adding Vinegar of Roses, and Powder of the Almonds, or Powder of Balsamites. This being applied hot to the Throat and Jaws, is good against pains in the Ears, Throat, and Gums: applied to the Fundament, it is good against the Piles, and stops their excessive Bleeding. Applied to the Region of the Heart, it proceeds against its Faltering, alleys Inflammations, causes Antonius's Fire, and is good against most Difficulties of the Stomach. Applied to the Joints, it strengthens them, and gives ease in the Tongue.

XCVI. White Rose Water. It is used as an Ophthalmic, is excellent good to cool Inflammated Eyes, stop the Fluxion of Rheum, and ease their pain. Take white Rose Water a Quart, choose Brandy a Pint, Honey & Ounces, Powder of Coelestite half an Ounce, mix, distil, digest, and keep the Water upon the Powder for Life. It is truly a most excellent Eye Water.

XCVII. Aqua Rosarium Rubrarium, Red Rose Water. It is well known, and of familiar use almost upon all occasions. It is Cooling, Cordial, Anodyne, Refreshing, and Cleansing the weak and fainting Spirits, whether used inwardly in Draughts, or Bowils, as Early Broth, Chicken Broth, Veal Broth, &c. or used outwardly to bath with, as on the Head, Temples, Nudities, &c. to ease their pain, heat, &c. Besides it has all the Virtues of the White Rose Water, being used as an Ophthalmic.

XCVIII. Aqua Rosarium Damascenorum, Damask or Musk Rose Water. Take Damask or Musk Roses, as much as you please, and without bruising put them into a Common Cellar, and draw off the Water with a gentle Fire, without burning, till the Rose Leavys are dry. Or thus. Take the whole Damask or Musk Roses, as many as you please (i.e. The Rose Leavys not exsiccated) beat them in a Stone Mortar, and in a Silver Vessel affaye on them a good quantity of Fair Water, which digest together for a Day or two, and then distill with a good Fire in a Copper Vessel Titre'd within, as is said: You will find upon the top of the Water some few Drops of a very Sweet and Odorous Oil, called by some Adept Rosarium, which if you please you may separate from the Water. Or thus, Take Damask or Musk Roses, bruise them or before, and then put them into a Wooden Vessel with a narrow Mouth, using them Stramin Super Flatus with Salt in fine Powder, and so much on top, as may contain about a Knob, after Vessel affaye with 2 or 3, Powder of Pomegranate, and Pith, and let it stand in a Cellar for a Month, 2, or 3, then distil with a Copper Vessel, so you will have a most odorous Rose Water, much exceeding all those which are distill'd the common way. Or thus, Take Damask or Musk Roses, and macerate them in Juniper, or White Linen, or Madras Wine, for a Week or more, then distill in a Copper Vessel as before. This is indeed a much better way, but far inferior to that of pickling with Salt, because in this you have a mixture of Spirit of Wine, with your Water; whereas the other is the pure Water alone. It is Cordial, and cleanses the Heart and Spirits, and is generally mixt with Cordial Waters and Medicaments, to make them the more acceptable. Cother in his Commentary upon Medicines, says, that to Ounces of Damask Rose Water drank in Morning Eating, does open and purge the Belly. If it will do this of its self, it will do it much better if it be sweetened with Syrup of Violets, or with Syrup of Roses mixt together.

XCIX. Spiritual Rosarium Damascenorum & Albusbata, Spirit of Damask or Musk Roses. Take Brandy a Pint, Musk or Damask Roses an Ounce, or Powder of the Almonds, or Powder of Balsamites. This being applied hot to the Throat and Jaws, is good against pains in the Ears, Throat, and Gums: applied to the Fundament, it is good against the Piles, and stops their excessive Bleeding. Applied to the Region of the Heart, it proceeds against its Faltering, alleys Inflammations, causes Antonius's Fire, and is good against most Difficulties of the Stomach. Applied to the Joints, it strengthens them, and gives ease in the Tongue.
Chap. 603. English Herbs.

Nature to a miracle. It is good against Melancholy, Grief, Palpitation of the Heart, Fainting, and Swallowing Fits; it cleanses the Head, Brain, Nerves, and Worms, and is an excellent thing against Convolutions, Convulsions, and other cold Distempers of the Brain and Nerves. Dose from 10 to 60 Drops or more, in a Glass of Damask Rose Water, sweetened with Syrup of Roses, or in a Glass of Choice Candy. Refluxes all this, it is a most admirable Perfume. It is a true Speculum, to elucidate the Mind, quicken the Sensible, and corroborate all the Examinations.

XCIX. Oleum Rosarium Chymicum, Chemical Oil or Fat of Roses. The Noble Oil of Rosarum is made according to the latter part of the first Process in the former Section. It has all the Virtues of the Exalted Spirit with advantage; for that 1 Drop of the Vital Cassell Sot Oil or Fat, is equivalent to, 40 Drops of the most Subtle and Sublime Spirits, and therefore is never given but from 1 to 2, or 6 Drops. It to be a Drone splint into White Sugar, with which it is to be well mixed, and then you may put that mixture, into a Glass of Gene
avious Wine, or any other proper Vehicle, in a Spiritus Cordis Water, and let the Patient take once, twice, or thrice a Day, as need may require. In the London Diocesan, the College gives it in this way of making the Spiritus, few Pungent, vulgar Spiritus Rosarium, Oil, Fat, or Spirit of Roses. Take as much fresh Damask Roses as you will, steep them 24 Hours in a sufficient quantity of warm Water, Press the Roses, and let the Infusion last, in a sufficient part of its strength, in a Spiritus Cordis Water, and let the Patient take once, twice, or thrice a Day, as need may require. In the London Diocesan, the College gives it in this way of making the Spiritus, few Pungent, vulgar Spiritus Rosarium, Oil, Fat, or Spirit of Roses. Take as much fresh Damask Roses as you will, steep them 24 Hours in a sufficient quantity of warm Water, Press the Roses, and let the Infusion last, in a sufficient part of its strength, in a Spiritus Cordis Water, and let the Patient take once, twice, or thrice a Day, as need may require. In the London Diocesan, the College gives it in this way of making the Spiritus, few Pungent, vulgar Spiritus Rosarium, Oil, Fat, or Spirit of Roses. Take as much fresh Damask Roses as you will, steep them 24 Hours in a sufficient quantity of warm Water, Press the Roses, and let the Infusion last, in a sufficient part of its strength, in a Spiritus Cordis Water, and let the Patient take once, twice, or thrice a Day, as need may require. In the London Diocesan, the College gives it in this way of making the Spiritus, few Pungent, vulgar Spiritus Rosarium, Oil, Fat, or Spirit of Roses. Take as much fresh Damask Roses as you will, steep them 24 Hours in a sufficient quantity of warm Water, Press the Roses, and let the Infusion last, in a sufficient part of its strength, in a Spiritus Cordis Water, and let the Patient take once, twice, or thrice a Day, as need may require. Chap. DCII.

Of ROSE Wild;

or,

BRIAR -- BUSH.

I. THE NAME. It is called in Greek, Pous Spondos; in Latin, Roffa Sylvestris, Roffa Canina; and in English, the Wild Rose, Briar Rose, and Dog Rose, or Canber Rose.

II. THE KINDS. There are twelve following Species are found with us, either growing Wild, or else nurished up in our Gardens, but being Wild Plants in their own Native Countries, viz. 1. Roffa Sylvestris insperata, Roffa Canina commutata, Our common Wild Briar Bush. 2. Roffa Sylvestris more odora carnea, The Wild briar Briar Rose. 3. Roffa Sylvestris Baucis, The Maucova Briar. 4. Roffa Sylvestris Virginensis, The Virginian Briar.
they, or other Roses do. After the Flowers are poll.

... come, the Kivt or Hepe, somewhat long and round, which are stiff hard of a yellowish red, or of a red

... dith yellow color, or of a rather bright shining 

... Coral color, which grow out in round Clusters, very perfect fult, and then the Pulp within, becomes perfectly fluid and of a pleasing acid Tafe. Within each such Pulp is a Kind of Dairy Dun, within which the Seed is enclosed. Upon this Wild Rose 

... Buft or Briar, as well upon the Eglantine Buft, 

... where fimmering green Spongia Plinia, a Spenny 

... bory, or Bul of Threads compos'd of many little 

... smallest, eightenth Cell, each one of which, but for 

... the most part a few Worm or Maggot in it.

IV. The second, or Wild hulth Briar Rose. This is so like the former, that it is fevefcly to be 

... differ'd from it, either for the height of the 

... Stem, or great store of Prickles, or smallfret's 

... of the Leaves, but only by the Flowers, which are 

... something larger, and of a deeper blufh, or pale 

... purple color, and something finer fweet.

V. The third, or Mulvovia Briar Rose. The Wild 

... Briar has feveral reddifh yellow Stalks rifting from 

... its Root, or rather bunched out as were 

... with Biflers in feveral places, with Prickles thereon, 

... like the fift Common Briar or Wild Rose. The 

... Leaves are not many, but fmall like the Common 

... with Hedge Briar, or rather fucfle, and turning 

... red in Summer. The Roses are finge and fmall, 

... of a darkcne color.

VI. The fourth, or Virginia Briar Rose. It has 

... feveral as large Stems and Branches as any other 

... Wild Roscs, tho' fome young ones are green, and the 

... elder grows, fet with many fmall Prickles, and a 

... few great ones among them. The Leaves are 

... green, and finging, fmall, and alfo round, 

... many fet on a middle Rife, one again another, 

... feem like unto the Single yellow Rose. The 

... Flowers grow at the tops of the Branches, confifting of 

... five fmall Leaves of a pale purple, or deep in 

... carene color, like unto finge of the Sweet Briar, 

... which fall away quickly, as they and others do.

VII. The fift, or Sweet white Briar Rose. It has 

... feveral Scents, about three Feet both 

... with fmall Prickles, as either the Common Wild 

... Briar or Eglantine is: and fett with like Winged 

... Leaves, but not fo green. At the tops of thofe 

... great Branches there are, but one Briar only, 

... confifting of five fmall Leaves, reafonable large, 

... and of a fweet Smell, with feveral yelvow Threads 

... in the middle. Thefe being poll away, the Heys 

... fmall, or that which is feen, and no yelvow, 

... containing within them a Kind of Hairy 

... down, in which the Seed is enclosed.

VIII. The fith, or the Vermilian Briar Rose of 

... Aftria. The younger Branches of this Roof Buft 

... are fucfle and reddifh, the elder of a brownifh 

... green, for with fmall Prickles, but not very thick, 

... great or fcorp. The Leaves are fomewhat larger 

... than thofe of the Single yellow Rose, elfe not much 

... wider. The Flowers are finge, as large as thofe of 

... the Yellow Roses, of which this Rose is fuppofed to be a Species, 

... but differing in color, this being of an exceccul Orange. 

... taverny color, with an Eye of Vermilion caft over it, 

... and of a paler yelvow on the out Side, after which 

... (being poll away) the Flowers succeed.

IX. The feventh, or Dwarf red Briar Roof 

... Aftria. It grows feveral two Feet high, with 

... flender green Stems, fett with few or no Thorns be- 

... low, but reappears higher with many Prickles, 

... beautiful green Leaves upon them like the Common red Rose, 

... and grows underneath, five or fveen fet together 

... upon a Stalk. At the tops of the Branches, come 

... forth very great bearded Hucks, where are contain-

... of the Flowers or Roses, which are large, and con- 

... fisting of five Leaves after, fome small Prickles, red 

... at the fift, but when deceaf'd with fying and grow- 

... ing much more pale, before they fall away, with 

... yellow Threads in the middle. After the Flowers 

... the Fruit on Hepe forced, with many rows of the 

... others, but greater than any of the former, and 

... made more in the fashion of a Pect, than any of them.

X. The eightt, or the Greater Apple Briar Roof. 

... Stock or Stem it is great, covered with a dark 

... gray Bark, but the younger Branches are something 

... reddifh, armed here and there with great and sharp 

... Prickles, but nothing fo great or pleafant as in the 

... Eglantine, altho' it be a Wild Kind. The Leaves 

... are of a subifh green color, almoft like unto the 

... fift White Roof, and five always fet together, 

... fmall from. The Flowers are small and finge, 

... confifting of five Leaves, with any Smell, or very 

... little, and but a little bigger than thofe of the 

... Sweet Briar Buft, and of the very fame deep 

... blufh color, every one of them finking, upon a rough 

... or prickly Bower, bordered in the manner of other 

... Roscs, which when the Flowers are fallen, grow 

... great, fomewhat long and round, Pelt fiftholed, 

... hearing the Bows on their tops, and being full ripe 

... are red, appearing the fmall Prickles on them, 

... with a fmall Pulp, in which is contained many white 

... hard and roundifh Seeds, like unto thofe of the 

... Eglantine Heys. The whole Plant confifts more in 

... the graceful appearance of thofe Apples as red, 

... hanging on the Branches, than in the Flowers, or 

... any other parts thereof, for the beauty of which, 

... it has been brought into Gardens.

XI. The Smith, or small Apple Briar Roof. This 

... Kof1 fettled rife above a Foot high, being of two 

... fsorts, whereas the one has but few Prickles on its Stalks, 

... and the other full of fmall Prickles (both to which are 

... oftentimes found in one Plant; but the very prickly the more 

... frequent) fet with long winged Stalks of Leaves, 

... being many full ripe round greenifh Leaves, fett one 

... another upon a middle Rife, ftrongly fcented 

... about the edges, femeing much like to a Bibet 

... Leaves, for the form and number fet together, from 

... whence one came of its Name. The Flowers are 

... finge and fmall, without Smell, after which come 

... full ripe round Heys, which are black when they are full ripe, 

... and full of Heys, or in the Heys of other Roses.

XII. The tenth, or Dwarf white Briar Roof. Its 

... Root creeps more than the rest, and it is one of 

... the fmalleft Roscs, feverely rifting a Foot high, being 

... with fmall Prickles, and with Leaves off, 

... according to the proportion of the Plant, and the 

... ramps, of the Kind. The Flowers are white and 

... fmall, giving Heys, or Fruit and Seed, ftreight the 

... fmall, giving Heys, or Fruit and Seed, liket the reft.

XIII. The eleventh, or Single dwarf Briar Roof 

... without Prickles. It grows very low, even almost 

... upon the Grounds, with green Stalks without any 

... Prickles on them, and fett with fmall winged Leaves, 

... fmall that they fcarce feem to be Leaves of a Roof. 

... Heys is finge, fmall, and of a pale reddifh color, 

... very fweet in some Sort, and as it is 

... without Smell in others, and flowering in fome 

... places both in the 

... Spring and Autumn.

XIV. The twelfth, or Ever-green Briar Roof. It 

... is a Biat very like to the Wild Single Eglantine, 

... bearing many very long green Branches, but more 

... fucfle, and weaker, fo that many times they bend 

... down, and can not be fowing without fome help, 

... and armed with boided Prickles, or other Roses be. 

... winged Leaves confift of 

... smaller Leaves for the most part, of which 

... fome two, which are fweet and apperative.

... the next two bigger than thoy, the highest 

... couple bigger than any of the former, and the end
Salmon's Herbal.

Lib. 1.

Leaf largest of all. This proportion it generally holds in every rooted Leaf through the whole Plant, which at the first coming forth are something rickish, with the young Branch which grows out with them, but being fully grown, are of a deep green color, somewhat shining withal, and dotted about the edges, which fall not away from the Branches, as other Rose Leaves do, but abide thereon, for the most part all the Winter. The Flowers grow four or five together at the root of the Branches, being single, consisting of five Leaves opposite, of a pure white color, much larger than the ordinary Musk Rose, and of a pleasing Smell, having many yellow Citrus or Threads in the middle.

XV. The Places. The two first grow in the Hedges almost every where throughout all England, but the second not so frequent as the first. The third came from Hedges, where it is a native. The fourth is from Virginia. The fifth from Germany, where it grows Wild in many places. The sixth and seventh were brought to us out of Affrica. The eighth grows, (tho' a Wild Plant in other Countries) with us only in Gardens. The ninth is found growing in many Barren and Heathy Grounds by Woods and Hedge sides, in many parts of this Kingdom. The twelfth, as also the third, fourth, fifth, sixth and seventh, (tho' growing Wild in their native places) yet are Inhabitants with us only in our Gardens.

XVI. The Times. Some of these Roses appear earlier than others, but generally from the end of May to the middle of August, and sometimes longer, according as the Seasons may prove favorable.

XVII. As to their Qualities, Specification, Preparations and Virtues of these Wild Roses, they are much the fame with those of Red Roses in the former Chapter, tho' indeed they are seldom or never used in Physick: however there are some other parts of the Wild Rose Buds, whose particular Virtues Authors have taken some notice of, viz.

VIII. The Preparations. 1. A Decotion or Infusion of the Root of the Common Wild Rose. 2. A Pulp, or Conserve of the ripe Hept of the same. 3. A Puder made of the same Pulp. 4. A Puder of the Brier Buds.

The Virtues.

XIX. The Decotion or Infusion of the Root in Wine. The Bark of the Root is to be shaved or scraped very thin, or finely, whilst fresh and green, and then to be infixed or Decocted in Wine, or 4 Ounces of it to a Quart. Plyn Lib. Sec. Cap. 4. says, that it is good to cure the Biting of a Mad Dog; I suppose inwardly taken for some time, and also to be externally applied.

XX. The Pulp of the ripe Hept. The Pulp is generally used whilst it is fresh: but if it is done for keeping, it must be made into a Conserve with Sugar. It is malt pletant and delectable to the Taste, helps Digestion, stops Catarrh, Spitting and Vomiting of Blood, and generally binds the Belly.

XXI. The Powder of the Pulp. It is made of the Infinitive Pulp of the ripe Hept. Taken in Syrupick Red Wine, it is good against a Diurete, stops all Fluxes of Blood whether upwards or downwards, all Fluxes of Bowels, as also the overvowing of the Terms, and the Whites in Women. Dose from 1 to 2 Drams.

XXII. The Powder of the Brier Buds. Being Drunk in White Fort Wine, or in Mead, or rather in the Infusion of Lignum Nepirinicum, it powerfully provokes Urine, expels the Stone, Sand, gravel, and Tartrarum, which is so hard and Bladder, and gives ease in the Stomach and Coffek, it also kills Worms in the Belly and drives them forth. Dose from half a Dram to a Dram and half. The Buds are stiff to be well directed in an Oven, and then the whole, viz. Worms or Maggots and all which are within them, are to be reduced to a Powder by beating in a Mortar.

CHAP. DCIII.

OF ROSMARY.

I. T H E Names. It is called in Arabic, Ethka; in Greek,Ἄθκα; in Latin, Lamiwmum, Licoritis Stephonaminis; in Latin, Lamiwmum Stephonaminis, or Corporum, which Epithet is added to the Latinw, to distinguish it from the other LIBANUMS which are Umbelliferous Plants: it is also called Romarinus, and Rosmarinus; in English, Rosemary.

II. The Kinds. Formerly there was but one Species known, but now there are more, as, 1. Rosmarinus Comunis (because it is used in Gardening). Rosmarinus Comunis, Our common Rosmary. De- lictumum on Pipon, takes it to be the Cofa nigra Thynspaffi: and Angiulare, will have it to be the Cofa Hap!i, acceptable to Bees, and therefore Sown near their Hives. Gofner in Hortis, calls it Rosmarinus minor. 2. Rosmarinus Herbarum, five or six, common Gilled Rosmary. 3. Rosmarinus Hypolepis; Rosmarinus major Cordes; Rosmarinus alter Gofner. Broad Leav'd Rosmary. To these you may add, 4. Rosmarinus Syrphi, or our Wild Rosmary.

The Description.

III. The first, or Our common Rosmary, has a long woody Root, spread out into many Arms or Branches, with a great number of Fibres articulated to them, of a brownish color on the out side. It springs up with a woody Stem, of close, firm, compact Substance, and whiteness, which in true grows up to a great height. It has been well observed in gardens places of our own Land (as well as in Spain and other Foreign Countries, where it is a Native) to grow to the body of a Tree of a considerable Magnitude, fit to make Instruments of, being cut into long thin Boards for that purpose. I saw 1 ftu six large bodied Rosmary Trees, when I was about 8 or 9 years old, and in the Month of June, in the Garden of one Mr. Wormal, in Kings-Lyn, Norfolk, Living in the Street near to the South Gate. However in those Plants, which grow not to such a prodigious Magnitude, the Stem is great and woody, of a close and firm Branching, it fall forth into fine and Great Arms, and from them again into many other smaller Branches, and those again into a vast number of yet smaller and thinner Branches at the Joints whereas of around several distances, many long and very narrow Lacerous, green above, and grayish under
Chap. 603. English Herbs.

Rosmary Common.

be taken of it the first Winter after it is Seain, and until it is grown up to some considerable height and strength. I have seen whole Beds, both the Seed, which has come up like any ordinary Herb, and being Transplanted and kept in order, has, in time, come to the common or ordinary Stature and Magnitude of Rosmary, but I am not to believe, it might be kept to be a Dwarf Plant like to our Dwarf Box. But our usual way of encroaching the Plant here in Eng.

land, is by tipping it, and setting those Stips, I seldom ever found them to fast growing. The whole Plant, especially when in its flowering time, is of a pleasing, frutitious, sharp, and volatile Smell, and exceeding fragrant.

IV. The second, or Gilded Rosmary. This in its Roots, Woodiness, Body or Stem, Arms, Branches, Leaves, Flowers, and Seed, magnitude, manner and form of growing, differs not at all from the former, but only in the color of the Leaves, which in this are edged or stript, or pointed, with a fair Gold yellow color, which continues all the Year through out, yet freer in Summer than in Winter.

V. The third, or Broad Leaved Rosmary. This also grows like the former, and tho' it grows very large in its Leaves, with in so much in England, yet it grows not so great, nor with such woody branches, as it does in Spain, Italy, and other hot Countries, where it is a Native, and natural, with it, is more tender to be kept. The Leaves are larger, and of a more deep shining green color, on the upper side, and little or nothing underneath, more thinly alfo, or sparsely set on the Stalks, but its Flowers and Seed are altogether the same in form, magnitude, and color, with the former.

VI. The fourth, or Our Wild Rosmary. This

Out North-Country Plant, grows not to be so high as the former, and has smaller Leaves, nothing so great and long as Rosmary Leaves, but thicker and shorter; of a dark green shining color above, and of somewhat a yellowish green underneath, which grows very sparsely on very slender and plant blackish green Twigs, at the tops of which grow the Flowers, not out of Rosmary but of a reddish color, the whole Plant is either scanty, or the Smell is so small that it is scarcely to be perceived.

VII. The Places. The first three are Natives of Spain, Italy, France, Greece, Asia, and other hot Southern Climates; and are now also become Natives with us here in England, and grow also admirably well in our Plantations in the West Indies, where they come to a greater Perfection than they do with us in our more Northern Climate. They grow also in Germany, Denmark, and other Northern Countries, but will not live or abide, in many of those Northern places, unless Housed in Winter, and kept in Stoves. The fourth grows in England, in several places of Lancashire and Yorkshire, and other parts bordering upon them, from whence it has been brought, and introduced into some Gardens more for its novelty, than for any special use it has. The Gilded or Silvered Rosmary, ought to be Planted in the most Sunny parts of the Gardens, for the more they are exposed to the Sun, the better they will be Striped or Marked, and the more Florid they will grow.

VIII. The Times. The three first Flowers sometimes in April, but always in May, and sometimes again in August: and the Seed is ripe not long after. They are eencroached also by setting the Stips in March, and afterwards again, in the end of August. The Wild Rosmary, Flowers in June and July. Gerard says, that it was found by Mr. Hedges in a Field called Little Reed among Hurtis Berries, near to a small Village called Metherley in Lancashire, and that it is called by Corda, Chama-

peuce.

IX. The Qualities. The last of four is a very

clearly ever used in Physick, the first three have all of them, the same Qualities, Virtues, and Operations, and are laid by Authors to be hot and dry in the third Degree: Anodyne, Apertive, Attractive, Carmine, Coagulative, Digestive, Diffusive, Cephalick, Neurotic, Stomachick, Rectonic, Cordial, Hysterick, Artificick, Emmenagogick, Sudo-

nicks, and Apericarphick.

X. The Specification. It prevails against the Head-ach and Maggins, from a cold cause, the Vitigo, Leprashy, Epilepsie, Apoplexy, Palsy, Convulsions, Cataracts, Drowning, Dullness of the Senses, Loos of Memory, Inflammation of the Stomach, Thinning Breast, Wind, in the Stomach and Bowels, Dimness of the Sight, Jaundice, Ob-

structions of the Terms, Gout, or a cold cause, all external pains and aches from a cold and moist cause, Lameness, Numbness, Weakness of the Joints, and in Contagious times, prevails even against the Plague it self and all Contagious and Infectious Diseases.

XI. The Preparations. You may make therefore,

1. A Juice or Elixir of the Leaves and Flowers.

2. A Tincture or Infusion of the Leaves and Flowers.

3. A Powder of the Leaves and Flowers of the Flowers.

4. An Inflated Oil of the Leaves and Flowers.

5. A Smoker or Fume.

6. A Tincture of Leaves and Flowers.

7. A Distilled Water.

8. A Distillate.

10. A Syrup.

11. A Cataract.

13. An Elixir.
The Virtues.

XII. The Juice or Essence. They Warm and comfort the Stomach, helping all cold Diseases thereof, as also of the Head, Lungs, Liver, Spleen, and Belly: they are good against all cold Diseases of the Head, Brain, Nerves and Womb, as vertigo, Dizziness, Drowsiness, Lethargy, Carus, Stupidities of the Seniles, loss or hurt of the Memory, Dumb Palsy, and loss of Speech, Falling-Breaths, Palsy of the head and extrem parts, Convulsions, coldness and weak-ness of the Womb, Whites, and other Distempers of those Parts. Doe one Spoonful more or less, Morning and Night in a Glass of Wine.

XIII. The Decoction or Infusion. These have the Virtues of the former if made in Milk, Whay, or Wine, but nothing near so powerful, and therefore may be taken in four, five, or six times the quantity. They are comfortable to the Stomach in all cold gripes thereof, quicken the Seniles, and are good against Loathing and Vomiting, Coughs, Cold, Woes, the shortness of Breath, Asthmas, and a secret Wind out of the Stomach and Bowels, Herpetic, chondriack, Melancholy, and sad poffitions of the Spleen. They are good for such as are Liver grown, and open the obstructions there of, by warming its parts, encroaching the grounded Humors afflicting it, and with it strengtheneth it: They are said also to cure the Yellow Jaundice.

XIV. The Powder of the Leaves and Flowers. It has all the Virtues of the Juice, Essence, Decoction and Infusion, but excels not its Power or Effects so soon as they do. It may be given to a Drink every Morning and Evening, and also at Night going to Bed, either mixed with a Little Honey, or some proper Syrup, as Syrup of Corin Peels, or in a Glass of Wine, or some other proper Vehicle.

XV. The Conserve of the flowers. It is an excel-lent Cardiac, and Stomatiek, and has all the Virtues of the Powder, and may be given to two or three Drums, Morning and Evening, Drinking after it, a Glass of Generous White Port, or Lisbon Wine, or Camarr.

XVI. The Infused Oil of the Leaves and Flowers. It may be made the common way by Infusion or Decoction: but Parti-furcer teachers use to make it after this manner. Take what quantity you will of the flowers, and put them into a strong Glaß, which hop close, and digest in her Horse Dent for 14 Days, and then being taken forth of the Dang and unstopped, tie a fine Linnen Cloak over the Mouth of the>Glaß<, and turn the said Month into the Mouth of another strong Glaß, which being set in the Sun, an Old will distill down into the inner Glaß, which is to keepe and preserved at a precious thing for many Uses both inward and outward. It is good for the cure of the Diseases before spoken of, and may be given from 1 to 7 Drops dript drop into Sugar, and then mixt with a Glass of choice Wine, or any other fit Vehic, and to be taken Morning and Evening.

It has been found by experience to clear the Sight, to cure the Palse and Lethargy, and to take away Spots, Marks, and Scars of the Skin.

XVII. The Smock or Flame. The dried Leaves filled small, and steamed in a Pipe, like as Tobacco is taken, is profitable for such as are troubled with Caraths, or Distillations of Rheumat, or Vexemr Coughs, Asthmas, Consumptions, &c. for it warms and comforteth the part, drys up the thin Rheum, which causes those Distillates, and helps to restore the weakened and decayed parts.

XVIII. The Tincture of the Leaves and Flowers. It has all the Virtues of the Essence and Infusion, and may be given in a Glass of Wine, or other fit Vehicle, from half a Spoonful to a Spoonful, Morning, Noon and Night. It is also an excellent thing to bath withall, dry planked, weak and bal-nured, trembling, Paralyse and Members; and is profitable against a cold Gout, being applied to the part, and in an external manner to be taken inwardly, if it is found to have fed the Stomach, and to make approaches thereunto.

XIX. The Distilled Water. It is good against Rheums and pains at Stomach, and clears the eye. Sight, the Eyes being oftentimes in the Luy room, waltherewith. You may therewith make an excellent Eye Water, after this manner. Take Water distilled from Rossy Leaves and Flowers a Quart, Common Spirit of Wine a Part and half, Clarified Honey 4 Ounces, Madder Roots 6 Ounces very well bruised, Alum half an Ounce, mix and infuse in a cold Digestion close flasks for a Month, then take the Glaß every Day, for a perfect cold and free of the clear Water, and keep it for Life.

XX. Agua Hungarica, The Hungarian Water. Take Rossy Flowers gathered a little after the flowering of the Tree is found, and then into a double Velle and off on them a Port and half of Alowes'd or Turned's Spirit of Wine, last exactly the Joints, digest in a gentle heat for 3 Days, then distill with a Velle of Spirit of Wine, and a Part of alowes'd Spirit afterwards, to have you in the Receiver a double Velle, which is, the Queen of Hungarian Waters. It prevaileth against all cold and moist Diseases of the Head, Brain, Nerves, Stomach, Heart, Lungs, Spleen, Womb, and other Viscera; as Appendices, Epilepsies, Convulsions, Cramps, Numbnesses, Palsies, Tremblings, weakness of the Nerves and Joints, Head-aches, Megrim, Vertigo, Carus, Le-thes, Sleepiness, and dimness of Sight. It com-forts the Head and Brain, refresht the Seniles, curset the Heart with Pafion, and revives all the Spirits Natural, Vital, and Animal. It is good a grand Palpitation, Fainting, and Swooning Fits, Sickness at Heart and Stomach, Racking Breath, Indigestion, want of Appetites, and other defects of those parts. It opens obstructions of Liver, Spleen, and Kidneys, and is an excellent thing against the Jaundice. It is good against the most vehement Carbath, cold Rheums, which are grown, Rhenum-tises, old Aches and Pains in any part of the Body, especially rheum of the Back and Loins. It is famous against Gripping of the Guts, the Collick, and breath or acromatious Humors in the Stomach and Bowels. It provokes Urine and dispels the Water. It clears the Liver, and facilitates both Birth and Afterbirth. It warms, comforts, and strengtheneth all parts weakened by cold and moisture, hard Labor, or over-taking, or that have been hurt by any Fall, Bruise or Wound. It carthes Watchfulnes, and takes away Drowsiness, strengthens the Nerves power-fully, and is said to be a Specieck in After-Pains, the Palse, Cramp, and other like Intermitties. It preserves Health, and keeps back Old Age, making those who take it, to look always young. It is good against the stings of Mad Dogs, Serpents, Vipers, or other Venomous Creatures; and is an absolute Antidote against the Malignity of the Plague, or any Malign and Pestiferal Fever, being an excellent preservative in all Infectious Times and Places. It is prevalent against the Furies, for it abates the thick Humors, digests Crudities, opens Obstructions, diffuses Congelations, and provokes Sweatings. And being given in a large Dose about 4 Hours before the coming of the Fit of an Ague, it has been often found to Cure it. It takes
Chap. 603. English Herbs.

takes away by being ufed, in all manner of Pimpls, Scurf, Murphie, Sunburnings, or any other difcolorings of the Skin, as also Unctuous Spots, Herpes, and other breakings out, by bathinge the Skin thereby. It is not harmfull to other Wafers are, which are made of Mercury, but it makes the Skin to incomparably pure and clear, and to frees it from all its Deformities and Defects, that it is not much inferior to any other Ointment whatsoever. Dote is from 50 to 80 Drops, more or lefs, 2 or 3 times a Day or ofteuer, in a Glas of Gentle Wine, Sack Weyhe, Polit Drink, Ale, Beer, or other Liquors which the Sick drinks, containing its use for some Weeks, or Months, as you fee occasion. Outwardly bathe the parts pained or hurt, therewith a Twice a Day, Morning and Evening, and continue it for 10, 15, or 20 Days or more, if need require.

XXI. The Chymical Oil. It is drawn from the Leaves and Flowers, as you draw the Chymical Oil of Lavender, Sage, Sain, &c. thus. Take of dried Rosmary Leaves, Flowers and Tops 2 Pounds, Spring Water 15 Quarts, dige it 24 Hours, and distill it in a great Alembick, with its Refrigerancy, or a Copper one with its Worm running through cold Water, so hot, you Water and Oil, which you may part by the help of a Funnel, or Separating Glofs; the Separating Water may serve for a New Dissolution, which then will yield the more Oil, you may take or 2 or 3 of the first Parts of Water, to keep for Rosmary Water. The Oil may be drawn out of the Rosmary sift gathered. It strengthens the Brain and Memory, fortifies the Heart, refills Pafion, and cures all flarts of Agues. It is abfolutely the greaftest Strengthener of the Sigh, and refiores of it affo, if lost, of any thing in the World, it makes the Heart merrier, and takes away all foolish Fantasies from the Brain. It efts the Tooth-ach, and all pains from a cold Cufe, and removes the cannot hinder Conception, and has indeed not only all the Virtues of the Hungarian Water beforagoing, but also of the Potatoes or Powes following, Dote a Gut. 4d to drop into Sugar, and to be taken in any proper Vehicle, as you take other Oils.

XXII. Spifion Rosmarini, Spirit of Rosmary. It is good against all cold Difaffes of the Head, Brain, Nerves, Joints, Stomach and Womb, prevails against Rheumaticks, cold Galls, and pains of the Head arising from Elegy, or any cold Cufe. It is good against the Vertigo, and Lethargy, strengthens the Memory and Eye Sight, helps Nervous, and Bile Noiffes in the Ear. It opens obstructions of the Vifers, revives and prefers the Natural heat, and refiores the Function of all the parts of the Body. Dote from 10 to 20 Drams of more, Morning and Evening in any Cordial Water.

XXIII. Potatoes Rosmarini, Powers of Rosmary. They are made in all reffells of the Leaves, Flowers and Tops, as are the Powers of Lavender, among the perfectly deglaffified Spirit of Rosmary with its Volatile Oil before Named, and Salt, by Digestion, Circulation, and a repeated Dissolution. Where Note, The greatest part of the Volatile Salt rife, and mixes with the Spirit and Oil by Dissolution, nor is there the tenth part of the First Salt left in the Fives, which after Calcination may be drawn forth, as you do Salt of Tartar. And that remaining part after paifafion of the Fives may, by many Con- 

ations of the Spirit be wholly drawn forth, and made to affend, without any Calcination at all. This is evident, for that after Calcination, they will give no Salt of any Kind, without the very much Labour, and then it will be a quantity very inconceiv-

able, not being the twentieth part of what might have otherwise been extracted. This is a Medicine of wonderful Virtues, nor do I know how to praise it enough, my perpetual uses thereof, has given me large satisfaction, as to its Excellency, which is indeed above the Force or any ordinary Remedy.

It prevails against all cold and moist Diseases of the Head, Brain, Nerves, Stomach, Heart, Womb, and other Vifers, as Apoplexies, Epilepticks, Convulsions, Cramps, Palfies, Tremblings, Numbness, and other Difaffes of these kind; and indeed it has all the Virtues of the Spirit, Oil, and Hungarian Water, but in a ten times more excited Degree. Dote from 30 to 60 Drops, Morning and Night in Wine, or some Cordial Water.

XXIV. Elixir Rosmarini, Elixir of Rosmary. This has all the Virtues of the Potatoes, Spirit, Oil, and Hungarian Water, Elixirized, or yet more Exalted, even to the highest Sublimity, and may be taken Morning and Night, or other it need re-quiress, from 22 to 50 Drops in Wine, or some other proper Vehicle.

CHAP. DCIV.

Of RUE Garden and Wild.

DR. RUE.

I. T H E N a m e. It is called in Aramick, סד, in Greek, Ρηημ, Peganum, quae co- 

fiditare, femem genitali coagumenti, in Latinis, Ruta; and in English, Rue, and Herb Grace.

II. The Kinds. There are many Plants called by the Name of Rue, with certain Epi- 

thets, which are not Rue, nor any of the Kinded thereof. Thefe which we shall take notice of in this Work, are only these following, viz. 1. Ruta Hortensis, Gaden 

Rue. 2. Ruta Sylvestris, Wild Rue, of both which we shall treat in this Chapter. 3. Ruta Praerens, Meadow Rue, of which in Chap. 605. 4. Ruta Caprifora, Gogie, Goats Rue, of which in Chap. 606 following.

III. The Kinds of the Garden and Wild flotts. Of the Garden Kinds there are three Species, viz 1. Ruta Hortensis major, Ruta Commonis, Ruta Sativa, Ruta Dentata, Ruta Latisolia, vet major, Our common Garden Rue. 2. Ruta Decurata, Gilded 

Rue. 3. Ruta Hortensis minor Tigris, Ruta Sativa minor, & Ruta Wenfola Ordi, Ruta græce Omea Donata, The lefter Garden Rte. Of the Wild Sort, there are also these Kinds Nupt in 

our Gardens, viz. 4. Ruta Sylvestris major Match, Lati, Lati, Lati, laurena, The greater Wild Rue. 5. Ruta Sylvestris minor, Ruta Lati, Lati, Lati, Lati, Lati, Lati, Lati, Lavi, Peganum Sylvestre, Ruta Sylvestris Se- 

cunda Dodonai, The limifer Wild Rte. 6. Har- 

mula, Bofan, Ruta Sylvestris Synica, Wild Af- 

fyrian Rue, &c.

The Descriptions.

IV. The sift, or Our Common Garden Rue. It has a Root which is white and woody, spreading far about in the Ground, and abiding many Years. It grows up with hard woody Stalks, branching forth on all Sides, and bearing thereon several long,

Leaves,
Rue Garden.

Leaves, divided into other small ones, being somewhat bider hard round pointed, of a dark bluish green color. The Flowers which grow at the tops, containing a small Leaf which are yellow; with a green Button in the middle, composed about with several small yellow Threads, which growing ripe, contain within it a small black Seed.

V. Gerard gives us a more simple Description of it in these Words. Its Root is woody, and covered with a whitish Bark, the Branches with a more green. The Leaves hereof consist of divers parts, and divided into Branches, about which are certain little ones, of an oval number, something broad, more long than round, smooth, and somewhat flat of a gray color, or greenish hue. The Flowers in the tops of the Branches, are of a pale yellow, consisting of four little Leaves, something hollow; in the middle of which stands up a little Head or Button four figure, yellow, five figure, containing as many little Cells, as it has corners, being composed about with little yellow Threads, in which little Cells the Seed is contained. The Leaf of it is of a very strong and rank Smell, and has a biting Taste.

VI. The second, or Gilded Rue. This is in its Roots, Stalks, Branches, form of the Leaves, Stalks, Alloquitas, and manner of growing, it is slightly the same with the former, having only in the color of the Leaves, which are not of them gilded on the edges, or at the ends, some of them are wholly green, some wholly gilded, or of a yellow color, and some of them part green, part gilded, either on the edges or ends, or both, as before expressed.

VII. The third, or Lesser Garden Rue. Its Root is white, woody, and stringy, spreading it fell abroad under the Earth, like the first sort. This whole Plant is so like to the Ordinary or Great Garden Kind, that if not biddingly minded, it may easily deceive the beholder. It rises up not so high, nor has it so great a Stalk. The Leaves are very like to the Greater Garden Kind, but that they are smaller, and of a blacker or darker green color. This more seldom gives any blowers with it, nor is the Smell thereof so strong, nor the Taste altogether so bitter, as the other; and in these things confaff the chief differences. Some are of Opinion that this Plant is the fest or greater sort of Wild Rue, described in the next Section, Transplanted and Planted in Gardens.

Rue Wild.

VIII. The fourth, or Greater Wild Rue. This is in all things like unto the Garden Rue, but that the Leaves are somewhat longer and narrower, and their color darker, more tending to green. The Stalk is strong and woody in its Native place of growth, much more than is it in this colder Climates, but rises not fully so high, as our Garden Kind does; and with it, it strongly attains to any woodiness. The Flowers are off yellow, composed of a yellow Leaves like unto it, being within them four square Heads (sometimes but three cornered) in whole Cells in contained the Seed like that of the Garden. The Leaves and whole Plant are of a more strong and virulent Smell than our Common Garden Kind.

IX. The fifth, or Smaller Wild Rue. Its Root is long and woody, and the Plant is small, yet like unto the former, saving that the Leaves hereof are much more finely cut than it, both shorter and smaller; but the Smell is as strong, or rather stronger than the other, as also its Taste and Qualities. The Stalk hereof, rises not so high as the last described above, but Branches it itself cut at the top, bearing small yellowish Flowers, having four square Heads with Cells therein, like the others, in which is contained small Seed.

X. The sixth, or Wild Affryran Rue. Its Root is thick and somewhat yellowish, with several small Lobes
The Virtues.

XVI. The Liquid Juice. Being often taken to half a Spoonful or more, in some potable liquor, or made up into a Loochab with Honey, it doth clear the Seed, and causes Barrenness, but it gives ease in the Collics, and Griplings of the Guts, and expels Wind. Eating all inward pains and troubles of the Bowels and other Viscera. It cures pains and stitches in the Sides, helps the Pleurisy, and Inflammation of the Lungs, and given to a Spoonful for some few times 2 or 3 Hours before the coming of an Ague Fit, it is said to cure it, it is good against Wind-nets of the Worm, repulses Vapours, and is prevalent against Flies of the Mother. It kills Worms in the Belly drank with Honeied Water. And drops warm into the Ears, it cures their pain. Dezink in Partly Water, it gives ease in the Strangury, Stone, and Uproar of Urine.

XVII. The Essence. It has all the Virtues of the Liquid Juice, and is much more powerful to the purposes intended. It is said to prevail against the Plague and all Pestilential Malignity, to cure the Epleys, Verigo, Pelturgy, and Murrain from a cold Gaule. And is profitable against Coughs, Colds, Houriasts, Wheezing, Althma, and hardened Sort of the Spleen, opening obstructions of Lungs, Liver, Spleen, and Miflurury. And half a Spoonful to 1 whole Spoonful in any proper Liquor.

XVIII. The Decidion and Inflation in Wine. They have all the Virtues of the Juice and Essence, but in a less degree, and therefore may be given Morning and Evening, to a quarter of a Pint at a time.

XX. The Powder of the Seed. Being given to they would destroy the Birth, in the Form, for which reason especially they ought to be avoided.

XXI. The Elixirium. Take Powder of the Leaves and Seeds of Rue, of each 2 Ounces, Cardamonium, Celery, Cloves, Nutmeg, Winsome Cinnamon, of each in fine Powder, 2 Drums, Virginia Smoke Root, Controversy, Zebedia, Saffron, Cob-nete, Tisbon Opium, of each in fine Powder, 1 Drum, Clarified Honey 16 Ounces, mix, and make an Elixirium. It is a singular good thing against the Plague and Pestilence, and all Malign and Pestilential Distempers, having the Virtues of the Juice, Essence, and Powder. Dose of a Drum to 2 or 3 Drums, Morning and Evening, drinking a Glas of Wine after it.

XXII. The Counter-Poison. It was invented by Mithridates King of Pontus, and is thus made. Take 20 Leaves of Rue, 6 Wolf-Nuts, 2 Eggs, a Scruple of Salth, and all together in a Chatter to a Meas. This is the quantity to be taken at a time, every Morning falling, and was the Antidote of Counter-Poison of King Mithridates, by which he secured himself that Day, from any Poison, as also any Infectious Distempers, and from the Plague is said.
Salmon's Herbal.

It is profitable also against the Stinging and Bittings of Scorpions, Hornets, Serpents, Mad-Dogs, and other Venemous Creatures.

XX. The Collyrium. Take Rue Water 2 Quarts, Juice of Rue 1 Fint, Sal Nitre an Ounce and half in fine Powder, mix, dissolve and filter through brown Paper. It is good against Wheals, Burning, Sunburning, Scutell, Morphew, and other Vices of the Skin: Bathed also on places pained, it gives ease to the fame. Or thus, Take of the Decotion in Wine 2 Fints, Sal Nitre an Ounce and half, Pepper in fine Powder half an Ounce, mix, digest 5 Days in a gentle Sandbox, decant the clear, filter and keep it for Use.

XXI. The Cymétique. Take Juice of Rue, Juice of Yonk, of each a Fint, Henry 6 Ounces, Gall of a Cock 2 Ounces, mix, dissolve, digest a Week, and being well settled, decant off the clear for Use. It heals Sore and Running Eyes, and helps Dimness of Sight.

XXII. The Extrakte. Take Powder of the Leaves and Seeds of Rue, Powder of Nutmeg, of each equal parts, mix them. Being Snuff up the Nostrils, it cleans the Head of cold, thick, and glutinous Humors, and being now and then inhaled, it is good to prevent Apoplexies, Epilepties, Le-charge, Vertigo's, &c. by bringing away the Mouthing Mutter.

XXIII. The Bath. A Decoction made of the Leaves of Rue 4 parts, Bay Leaves 2 parts, Southernwood 1 part, by boiling them in a suffient quantity of Boiling Water, is of good use to Bath with, and to fit in the same who are troubled with the Jaundice, Gout, Sciatica, Rheumatismus, and other the like Diffacies, the Herbs being also applied warm to the parts affected. It helps also the Swelling of the Cods, they being also Bathed therewith.

XXIV. The Oil by Decoction or Infusion in Oil Olives. It is made of the bruised Herb, and ripe Oil Olives, as you make Oil of Roses. It warms and heals, comforts the Nerves and Joints, strengthens them, and is prevalent against Trembling, Numbness, Cramps, Convulsions, Pains and Dead Palsies. It is good against the Wind Colic, as also the Swelling, Indurations and Windances of the Womb, Vapors and Hysterick Fits, if the threue and parts thencefrom, and other parts affected, be unmolest therewith.

XXV. Unguentum Rutaceum, Ointment of Rue. Take green Rue 4 Handsfuls, Mint, Origanum, Penny-Royal, Sage, Wormwood, of each a Handsful, bruise them in a Mortar, put them old or Salted Hogs Lard 3 Pounds: digest 4 Days in an Earthen Vessel in Horse-Dung, till the Grease be cleared, then press it out in a Press, and add new Herbs, repeating this Work 4 times. Take of this Diggled Lard 16 Ounces, Oils of Bay, of each 4 Ounces, Tocymnocha, Gum Elemt, of each 3 Ounces, Oil of Nutmegs by express 2 Ounces, Oils of Juniper Berries, of Rosmary, of Spike and Petroleum, of each an Ounce, of Cassie or Genes Soap, 6 Ounces, Essence of Coffee, extracted with Spirit of Wine redickled, 2 Ounces, mix, and melt them which are to be melted, with a gentle Fire, then add the Chymical Oils, at the end and make an Ointment according to Art. It diffuses, diffuses, and heals, and else it manners and brings to Suppression. It is Anodyne, Carminative, and A Harborick: good against moft cold and moft Diffacies of the Head, Brain, Nerves, Stomach, Belly, Worm, Reins, and Joints. It prevails against the Gout, Rheumattism, Sciatica, Fallo, Dead Pulse, Cramps, Convulsions, Ilos of Memory, Currus, Megrim, Verrigo, Cans, Lethargy, Colick, weakness of the Limbs, Rickets in Children. It diffolves the hard Tumors, Noles and Gums in the Teeth, and is of singular use against all cold and moft Diffacies whatsoever.

XXVI. The Cataplasme. It is made of the bruised Herb 4 parts, Camom Seed 3 parts, Oil 1 part, adding a little Vinagre, and so much Curricid to bring it to a Consistency. It is good against pains of the Stomach, Sides, Spleen, Reins, Belly, and Worms, as well the Gout whether in Hands or Feet, being applied as hot as it can be endur'd. XXX. The Pictes. The Leaves are first boil'd gently in Water, then being taken out and drain'd, they are put into Pictes, such as is used to be put into Pictes to warm Blood; and being covered with a Cover of Meat, it is profitable against Dimines of Sight, to warm a cold Stomach, and caufe a good Appetite and Digestion.

XXXI. The Rectific'd Water. It is distil'd as you distil other Waters; or rather after the manner taught in the next Section. It has the Virtues of the Juice and Essence, but vastly weaker. It is a good Ophthalmeic and Cymétique, and may be used as a Vehicle to convey other Preparations of the Plant in. Being taken to 3 or 4 Ounces, a little sweetned with Syrup of Citron, it gives prompt relief in Palpitation, Swelling, and a qual of pain, and to such as are troubled with pain and fickness at Stomach.

XXXII. Spiritus Ruris, Spirit of Rue. Take fresh Rue bruised it well, put it into a Wooden Vessel, and add to it warm Spring Water a sufficient quantity, and to every Gallon of the whole Matter, a Pound of Sugar or Molasses, let it ferment for 2 Days, then put in more Water, and distil it in a Copper Vessel, drawing off a third part for Spirit of Rue, and a third part more for Rue Water, for the ufe in the former Section, which keep apart, and the Spirit you may refilify according to Art. Or thus, Take 36 parts of bruised and pound'd, Rellifhed Spirit of Wine 8 Quarts, mix, digest 8 Hours; then distil in Balance to dryness. This Spirit put upon as much more fresh Rue bruised, digest and distil as before, which repeat in like manner a third time, if you would have a very Strong Spirit, and finally reype with the Essential properties of the Herb. It is hot and dry, piercing and unctuating, affects and expels Wind, is Cephalick, Nutritious, Hyderick, and Alexipharmick, use chiefly against the Plague and all other Malign Diapheses. It is highly Sedative, expels Poisons, cures the Plague, expels the gout, Colic, and bilious, expels the Guts, bittings of Mad Dogs, and all other Venemous Beasts. It is probable against Agues, inwardly taken 2 or 3 Hours before the Fit, and outwardly bath'd upon the Neck Bone, as also the Megrims, Head-ache, Vertigo, Sicknes at Stomach, Palpitation at Heart, Swellets, and the like. It is a provoked of the Terms in Women, and therefore not given to Women with Child. Dose from 1 Dram to 3, in any Cordial Draught, or in a Glass of Wine. It facilitates the Birth, and forces away the After Birth and Dead Child.

XXXIII. Oleum Ruris, Oil of Rue. It is made altogether in the same manner as you make Olej of Rosmary Chymical. It is filled with the Essential Salt of the Oil, and by reason it is of a quick and penetrating Quality, it ought to be boil'd gently, and in a small Dose, as from 2, to 6, or 8 Drops; never alone, but mixed with some other convenient Medicine, because it has a Vehement heat and burning. This Oil has all the Virtues of Infusion and Spirit after going, and may be given in all those cases, with the Cure nowhinted. The way to take it is to drop the intended quantity upon
Chap. 604. English Herbs.

971

upon Sugar, lusting it sink into it, or mixing it well with it, and so diffusing the Sugar in some Cordial Water, or Wine, or Sack Wines, or other Proper Vehicles, by which means the Oil will be better incorporated therewith, and then it is to be drunk up.

XXXIV. Powders, or Pois. These have all the Virtues of the Juice, Essence, Spirit, and Oil accompanying, as also of the Elixir following. But they may, and do much exceed the Juice, Essence, Spirit, and Elixir, in their strength by their Sublimity and Exaltation; yet they fall below the Force and Excellence of the Elixir, in the next Section, which answers to all the Intentions of the whole Plant. These Powders may begin Morning, Noon, and Night; from 40, to 80, or 100 Drops in a Glass of Wine, or other Liquor, conducing to the Intention for which they are given. They facilitate the Birth, bring away the After-Birth, and cause a due cleaning afterwards.

XXXV. Elixir Rue, Elixir of Rue. Take 8 Sols. of the Powder in 8 Ounces. Ground very well in a Mortar with 2 Ounces of highly calcined Solf of Sols: mix all together, and digest cold for a Month, shaking the Glafe once or twice a Day; then being well settled, decant the clear Elks, and keep it in a Glafie close stopp’d for use. On this, Take of our Spiritus Lapidis a Quarter, Rue in four Powder 6 Ounces, ait and digest cold for a Month, shaking the Glafe once or twice a Day; then the Forces being subjected to the clear Elks, and keep it clup stopp’d for use. It is a most active and powerful thing against the Measles, Small Pox, Spotted Fever, and all sorts of Maladies, Buming, or Pernicious Fevers: It effectually cures the Brings of Mad Dogs, Rattle Snakes, Vipers, and all other Venemous Serpents or Creatures, destroying their Poison in its Root and Essence. It drives up Watery Humors in Dropplings, exces pains in the Head, being mixt with Oil of Better Almonds, and drop into them. It helps dimnes of Sight, being mixt with a Gall of a Crock and a little Honey, and drop into the Eyes. It exes all sorts of Pains. Torments whatsoever, being inwardly taken and outwardly applied to the place; but it is not too often to be taken inwardly, because it is apt to dry up and consume the Seed, and does not the Generative Power and Facility. It helps pains in the Brest and Sides, Stitches, Plufigues, inward bruises, Googles, Gofts, Hoar-fnees, Wheezing, Hoar-frees of Breast, Almaha, Infanation of the Lungs, and the Baking Fins of Agues. It is powerful against the Wind Cholick, gripings in the Guts, flickets and pain at Stomach, warming, comforting and cherishing those parts, prevails against Sore-breasts, and cures a good Appetite, and a great Digession. It is prevalent against Vapors, Fits of the Mother, and other discontents of the Womb: and being given in time of Labor, it facil- litates the Birth, and brings away the After-Birth, and after a very admirable manner other precursors or Cauts After-pains. It effectually kills Worms of all sorts, whether in old or young, and outwardly applied cures pains of the Guts proceeding from a cold Caufe, whether in the Hands, Knees, Flaps, or Fever, for which it is a very admirable thing. Outwardly by bathing it also serves to the Back Bone, it is very beneficial against the Fins of Anges. It may be given from half a Dram, to a Dram or more, mixt with some proper Syrup, or in Angelica Water, or some other Cordial Water, or in Sack Wine or in a Glass of Generous Wine, in the Morning falling, and Night before Bed, and sometimes once or twice in the Day before, according to the Exigency of the Disease.

XXXVI. The Spirituif Elixir. It has all the Virtues of the Juice, Essence, Spirit, Pois, and Elixir, but in a much lower degree of Power and Efficiency: but it may be of good Service and uto where the Powers of Elixir are not to be had. It may be given from one Dram to three times in one Cordial Water, or Generous Wine, Morning, Noon, and Night.

XXXVIII. The Acid Tibure. It is a peculiar thing against the Plague and Spotted Powa; and in all malign and pellitifal Diseases it destroys the malignity, and so extricates the Patient from the greatest danger, if the hopes of Life be not past. Dose 40 or 60 Drops at a time in Cordial Water, Angelica Water, or some Generous Wine, 4, or 6 times a Day.

XXXIX. The Oily Tibure. It provokes Urine Powerfully, and is profitable against the Stone, Sand, Gravel, Strangury, and other Difference of the Urinary parts; as also against the Cholick, gripings of the Guts, Wind and other Difference of the Bode. Inwardly taken Morning, Noon, and Night, from 15 to 30 Drops or more, it is a most excellent thing against Numbness, Tosting of the Limbs, and Palsy, more especially if the parts afffoot and Spine hurt, be Morning and Night anointed with the fame for some considerable time.

XL. The Saline Tibure. It is chiefly for External uses, gives caff in the Gout in Hands or Feet, and other like pains in the External parts of the Body. It is also a good Cifrritch, and is pro- fitable against Taming, Sunburning, Scurf, Matthew, Pimpls, Puffs, Discolorings, Tettis, Ring-Worms, and other Breaking out, and Deformities of the Skin; the Skin (lift waffit clean with warm Water) being waffit or bathed therewith or 5 times a Day.

C H A P. DCV.

Of RUE Medow.

T H E N R E N. It is called in Greek, Νιμην, 870, or Νιμηνις Νιμηνις, Vines, as some think, and had dam germéne prorudic elegetit; in Latin, Thalloturum, & Thaloturum, also速率 painteris & Rate praeretus: and some have called it Fipinum, pali, Fiver, which is Rate: others Εθνοδοραβορνομόν (but very unproperly, for it is no Rhusarh of any kind) but I suppos that they do called it from the yellow color of the Root, and its truly purging, and binding Qualities, in all which, it is very like to Rhusarh. In English, Medow Rue.

II. The Kinds. Authors make two or more Kinds of this Plant, but we shall describe only the five following, as being Inhabitants of our Country, or of our American Plantations. 1. Thalloturum majus vulgaris Labelli, Rux Syderalis Caffalatis, Fag- nam Lagumdis, Thalloturum Cdratogena, Thalloturum Comorari, Saxfraga Lutea Gefferti. Our common greater Medow Rue. 2. Thalloturum majus album Hodanum, Thalloturum Italianum Comorari, Rux Germani, Rux Medicarum, Dodana, Rux, praeferens teetilis Labelli.
Salmon's Herbal. Lib. 1.

VI. The fourth, or Virginia Meadow Rue. This it is very like unto the first Species, but that it is altogether lesser, its Stalks are a Span, or Foot long; its Leaves are thinner and tender, its Root is fine and slender, and the little Flowers grow together in small Bunches, or Tufts, of a light yellow color, almoist white, and are of an unpleasant Savor.

VII. Gerard thus describes it. This small Kind is very like unto the first Species, but that it is altogether lesser; its Stalks are a Span, or Foot long; its Leaves are thinner and tender; its Root is fine and slender, and the little Flowers grow together in small Bunches or Tufts, of a light yellow color, almoast white, and are of an unpleasant Savor.
cond or Great Spanish Kind, that they can fiercely be known answer'd, but that this is so that of Scaevus and Lesser. The flowers at the top of the Branches are at first of a pale blue color, but being blown open, contain of five to seven Leaves, and a number of white Threads in the middle tips with yellow.

IX. The fifth, or Lesser purple Virginie Medow Rue. This is in a small astrleapis much like the former, but smaller, and differs more in the color of its flowers, which in this are of a purple color tips with yellow.

X. The Places. The fifth grows in many places in England, in the borders of moft and plathy Medows and by Ditch fides. The second is also found in our moft Medows and by Ditch fides but near the Sea, as at Margate on the Chhopefully, on the left Hand, as you go from the Town to the Sea fide, and in other places farther from the Sea. But this grows alfo in Spain, from whence it has been brought to us, whence came the Name of Spanish Medow Rue, but is truly a Native alfo of England. The fifth grows alfo in lower Grounds by River fides. All these grow alfo growing along Dutch fides leading from Kentiff Street to St. Thomas Waterings, (the place of Execution) on the right Hand. They grow alfo upon the Banks of the Thames leading from Blackwall near London, and in several other places. The two last came to us from Virginia.

XI. The Times. They all Flower in the Months of July and August, the Seeds of Seed are ripe in some short time after.

XII. The Qualities. It is hot and dry in the second Degree, is Abfbructive, Aperitive, and genly Cathartic or Soluble.

XIII. The Applications. It is used to cure the Plague or Petteulence, and the Yellow Jaundice; and is profitable for such as have the Falling-sicknes.

XIV. The Preparations. There is, 1. The Herb itself, used as a Pot Herb. 2. A Juice or Essence. 3. A Decoction of Roots or Leaves in Ale. 4. A Decoction of the Same in Water. 5. A Cataplasm of the Leaves. 6. A Diluted Water. 7. An Acid Tincture of Roots, Leaves, and Flowers. 8. A Saline Tincture of the Roots.

The Virtues.

XV. The Fresh Herb and Roots. They are commonly used as Pot-Herbs, with other Herbs; and if they are put in plentifully, they greatly purge the Belly, and provoke to Stool, but the Roots more than the Leaves.

XVI. The Juice or Essence of the Roots and Leaves. They open Obstructions of the Vifera, and cleafie; and being taken from 2 Quartfkins to 4 or 5, or more, they very pleasantly and easily purge and cleafie the Belly of this, clammy and greasy Casualties. They are particularly given against the Plague, and all other malignt, contagious, and pestifential Diftempers. In Saxony the Juice is used against the Jaundice, it is indeed profitable in that Country where Antimonial Broom be given once or twice beforehand. Lrudentens in transferring the Name Pignanoo to Medow Rue, does therewith ascribe to it a Virtue proper to Rae, as if it did belong to his size, that it raifes or refuces him out of his Pit, that is troubled with the Epilepsie or Falling Sickness, if some of the Juice of it be put up into his Nostrils, and kept there a while.

XVII. The decoction of the Roots or Leaves in Ale. Being drank pretty largely it provokes to Stool and gently purges; but the Decoction of the Roots is more powerful than that of the Leaves, and carries off much of the Morbidick Matter of the Jaundice and Epilepsie.

XVIII. The Decoction of the Roots or Leaves in Water. Being wafted upon the places troubled with Vermine or Lice, while it is very warm, it is said perfectly to destroy them; but it dries up old Sores, and make running Scabs, the places effected being bathed therewith very hot, 2 or 3 times a Day or more, for near half an Hour at a time; it warms, comforts, foddens, and opens the Pores of the Scabs, Ulcers, and Fiefe, as alfo the Skin adjacent thereto, and, powerfuly attracts and draws forth both the Virulence and Morbidick Matter.

XIX. The Cataplasm of the Leaves. It is made by beating them in a Mortar frefh and green, and so applied to old Sores it brings them to cicaturizing, and does perfectly cure old Ulcers, as Day's ulcer, fly's, and Gothen fly's, it dries without any heat or irritation.

XX. The Diluted Water of the Roots, Leaves, and Flowers. It has the Virtues of the Juice and Essence, Decoction, and Cataplasm; but is not so powerful in its effects; but if a little Nitre be diffolved in it, it becomes a good Cataplasm.

XXI. The Acid Tincture of Roots, Leaves, and Flowers. It has all the Virtues of the Juice and Essence, and a Specichick against the Plague or Pestifcence, and all forms of malign and pestifential Diftempers. Dofe 40, 50, or 60 Drops in all that the Patient drinks, as alfo in all his Broth or Spoonmeat, except it is made of Milk.

XXII. The Saline Tincture of the Roots. It is very Affbr active, and a great cleanser of the Flesh and Skin from Pimplles, Puffes, Tettus, Ring-worms, Scabs, Ich, running Sores, Scurf, Morbiferous, and other breakings out, and withall kills Lice, and other Vermine, to which the Patient is Subject, being used very hot or 1 times a Day, and for some considerable time, as nearly half in an Hour, every time it is used, it opens the Pores of the Flesh and Skin, and draws forth powerfully the Purulent and Morbidick Particles of the same.

CHAP. DCVI. ENGLISH HERBS.

OF RUE -- GOATS.

I. THE NAMES. The Greeks knew nothing hereof; the Latins call it Galega, Rura Caprinaria, alfo Herba Gallica, as Translators do; in English it is called Goats-Rue.

II. THE KINDS. Those which Authors have chiefly taken notice are these two, 1. Galega vel Rura Caprinaria Vulgaris, Our common Goats-Rue. 2. Galega Monetae Lucubiros, Mountain Goats-Rue.

III. THE DESCRIPTIONS. As to the Descriptions of these Plants, their Places of Growth, and Times of Flowering and Seedings, as also their Qualities, Specification, Preparations, and Virtues, we shall say nothing to this.
V. The Green Herb. It makes good Food or Fodder for Sheep, Goats, Cows, Oxen, and other Cattle, when it Feeds and fatters very well; being chop'd small, and mix'd with Bran and Barley Meal, and given to Hens, is faid to fatten them aloft, and to make them to lay Eggs plentifully. Reduced into Powder, and taken to a Dinn Mooning and Evening in a Glass of cold Canary, it is a prefervative against the Infelicion of the Plague of any other Malign, Contagious, Epidemical or Pelticent Difeafe, and to kill Worms in Children.

VI. The Rob of the Juice. Take the Expreffed Juice, Chrifte it with Whites of Eggs, then Eva- porate it to the thicknefs of new Honey, or fomething thicker; to every Pound of which add, half a Pound of double Refined Sugar, melt and mix, and keep it for Life. It has the Virtues of the Juice and Excrement, the one altogether to powerful, becaufe many of the Volatile Parfumes are lost in the abfcifion, but is of great ufe in making the Elecyry, and in that Cafe much tranfports Honey. It may be taken from half a Spoonful to a Spoonful in Wine or fome other proper Veficle to kill Worms in Children.

VII. The Syrup of the Juice. It is of good ufe in the Plague, and all Sorts of Pelticent Difeafes being taken in Treadle Water, or fome other Antidote Veficle Morning and Night, both as a prophylactick and as a Carcative: if the Perfom is infected it will be good to put them to Bed, and cure them to Sweet two or three Hours thereupon. Dote 3 or 4 Spoonfuls at a time. It is giv'n also against the Meazles and Small Fox, with the fame Success.

VIII. The Oil of the Flowers by Infufion or Decoction. Anointed upon the Navel it is laid to kill Worms in the Belly. Anointed on the Stomach, Back Bone, Crown of the Head, and Temples, it has been found profitable against the Epilepsie or Falling-ficknefs. Anointed all over the Belly, it gives cafe in the Colick, gripings of the Guts, and Convulfions of the Bovines.

IX. The Spirit from the whole Plant. It is singularly Cordial, and profitable against all Pelticent and Influenzal Difeafes, having all the Virtues of the Juice, Effeince, Infufion, or Spirituos, and may be given to a Spoonful or a time mixed with the Syrup. It preferves and defends the Heart againft Palpitations, Faintings, Sweatings, Sick- nefs at Sowings, and other like Difeafes of the Procordia, and is an Antidote against Melancholy Vapors oppressing the Spirits.

X. The Wurt. It is made by a mixture of the Spirits, Juice, and Wine Vinegar in equal parts. Being applied very hot to the part, it defends it against Gangrene, and prevents their running fuffer- fath, is probable to cleanse and heal running Sore and Ulcers, to destroy their Malignity, to prevent their fquifting and spreading; and to defend the Vital Powers from danger, more efpecially if it be bathed aloft upon the Region of the Heart, and over the whole Belly.

CHAP. DCVII.

OF RUPTURE-WORT. OR, BURST-WORT.

I. THE NAME. It has no Greek Name that we know of, unlefs you will allow of "Pervenum Empetrum," which Tragus and Lonicer give it, yet can scarcely be admitted of, becaufe, it is more peculiar to Sapiere in Latin. It is called hernia, and Herba: in English, Rupture-wort, and Burst-wort.

II. THE KINDS. The Chief Sorts which are most usual with us are, 1. Hernia, major, Hernia vulgaris, Emperator Tragus & Lonicerii, Polygonum minus Mabillon, who calls it also major; major, Nonnullis, Millegarum, Quibusdam, Hernia, Empetrum, Angulorum, Hernia multigranis; tertili, his Coniunctio, Polygonum minus, Hernia major Barbini, but generally by Commoners, Dobrincus, Gertrud, Gerard, Ludovici, Ternant, and Thallicus, Our common Rupture-wort, or the greater Rupture-wort: 2. Hernia major Africana.
Rupture-wort Common.

Span or more long, which are divided into many, other smaller and almost thready parts, fall of small joints, set very thick together, where at some forth likewise, a great number of exceeding small yellowish flowers, scarcely to be discerned from the stools and leaves, which turn into seed as small as the very Dust. This plant has neither smell nor taste at first, but afterwards it has a little styptic or astringent taste, without any heat, yet a little bitter and sharp withal. The cut which we have given you here is from Matthiolus his Epitome, but the Carter has not well represented the vast number of flowers and seed at every joint with which this Plant is usually replenished.

The Virtues.

XII. The Juice or Essence. They provoke Urine, and are said to break the Stone, if it is composed of a Gritty Substance; yet they stop all sorts of Fluxes of the Belly and Worms; and are profitable to constringate Ruptures of the Bowels in young people, being taken for 40 Days together, the Patient lying all the time in Bed. Dose: 3 Spoonfuls at a time, Morning, Noon and Night, in a Glass of Red Styrick Wine; given in the same Dose in White Port or Lisbon, it provokes Urine, and is profitable against the Strangury.

XIII. The Extraction of the Herb in Wine or Water. It has all the Virtues of the Juice and Essence, and may be given at like times from a quarter of a Pint to half a Pint.

XIV. The Powder of the dried Herb. A Dram of it taken at a time, Morning and Evening in a Glass of White Wine is good against the Strangury, and for such as are troubled with gravel in the Reins or Bladder, causing to make Urine plentifully. Taken in Red Styrick Wine, it stops Fluxes of the Bowels, and helps Ruptures.
Salmon's Herbal. Lib. 1.

CHAP. DCVIII.

of Rushes.

1. The Names. The Rush is called in Arabic, Dir; in Greek, ξυκας (a Loris & V afterwards). in Latin, Juncus (a Juncs). from the Greek, of binding things together: and in English, Rush. 2. The Kinds. Authors have given us almost thirty several sorts of Rushes, most of which grow neither in our British Islands, nor yet in any of our Foreign West-India Plantations; the most usual with us are the thirteen following, viz. 1. Mariscus Pilaeus. 2. Holboelenus. 3. Juncus floridus, which some take to be, Gladiolus Palustris, as Lugdenensis thinks; others call it Scirpus, tho' the Ancients (as it is thought) took them to be different plants: yet Toreno in Andria, says, Junci Species eft Scirpus levis & crenula; and such a one is this Rush, having neither joint or Knit in it, whence came the Proverb, Nolam in Scirpo quernere, speaking of such as temperate or doubt, where none is to be made or found. It is called by Dioscorides Ḳ蓣γς, Juncus levis, but some think the Text is there corrupted, and that it ought to be ξύκας, Juncus palustris, as Paulus Aegineta calls it, which Hermodorus Barbarus observed also, Juncus gratus Holboelenus Dondei & Geminari, Holboelenus Theophrasti Lugdenensis, Juncus palustri major Tragi, Juncus aquaticus & Levii maximus Lobelii, aituranqui; Our common great Bull Rush. 2. Juncus Levii vulgaris. 3. Juncus Meandrus Baillii. 4. Juncus Sylvaticus Thebanae. 5. Our common sort of Smooth Water Rush, or middle sort of Bull Rush. 6. Juncus Levii panicula sancta minor. 7. Juncus vulgaris major. 8. Juncus Levii & vulgaris Cordis, Dodonae, & Lobelij. 9. Oxyschoenus Aquilinurus & Lugdenensis. 10. Another sort of great Scotch Rush. 11. Juncus Levii panicula major Baillie, The smallest Bull Rush with different Tops. 12. Juncus Levii Flos Gomeronus Lugdenensis, Hovell Headed Rush. 13. Juncus acutus vulgaris. 14. Juncus acutus & others. 15. Juncus acutus vulgaris Dodone, & Lobelij. Our common small hard Rush. 16. Oxyschoenus minor Juncus acutus Caballo Britannicus. Our Welsh flap Rush. 17. Juncus acutus Maritimus Anglice, English Sea hard Rush. 18. Juncus Capitatus Equisetius. 19. Juncus aquaticus minor capitatis equisetii Lobelij. Their common Stalk one. 20. Juncus capitatis equisetii alterius, The lesser Aglet Headed Rush. 21. Juncus Floridus major, Calyx.
V. The third, or Other sort of great smooth Rushe. The Root of this is buffy like the lift just now described. And this other greater sort is very like to it, varying that it grows with a leffer flower of Rushe, of a darkest green color, and the Taft, or brownish Puricle also, is more spread abroad at large, each part of it standing upon a pretty long foot Stake, and is broad below, and pointed upwards.

VI. The fourth, or Smaller Bull Rushe with differnt Puricles. This differs from the greater sort just before described, only in the smallness of the Plant, it growing in deep Ground, which some suppose to be the Cause of its smallness.

VII. The fifth, or Round Headed Rushe. Its Root is buffy like to the second sort above, from which rise up several Shoots, like to that Kind also, and pitby within like it: The chiefest difference consists in this, that the Twisted Heads stand something close together, are rough, and not pointed at all.

VIII. The sixth, or Our common small hard Rusheetes. They have a short buffy, fibrous or stringy Root, from whence come forth several Shoots, they grow in the same manner as the others do, but that sometimes the Stakes or Rushees, send as it were other Rushees out of their sides, or one from another, and not all from the Root separately as the others. They are also hard and sharper pointed, with little or no Pith within them, yet are they hollow, porous on stringy, and their Tafft at the upper end of the Rushees, small, hard, spread abroad, and short, which break out near the tops as the others do.

IX. The seventh, or Our Welsh sharp Rushe. Its Root consists of a Rushe of brownish hard Fibres or Strings. The Rushees of this Kind are about 5 or 7 inches long or more, something great, hard, and sharp pointed; from among which rise up naked Rushees or Stakes, half a Yard high, and from between the short Leaves, breaks forth a sparsed Puricle, of several small fluffy Heads, like unto Reed Grass, of a brownish Color.

X. The eighth, or English Sea hard Rushe. It has a long, hard, creeping and fibrous Root, with several brown skinny Heads, out of which rise thick, round, hard, long, and very sharp pointed Rushees, from among which rise up other Ruffly Stakes two or three Feet high, bearing near the tops, about 9 inches below them, a slender and long Puricle, composed of many fluffy Heads, which when they are ripe, open and show their Seed.

XI. The ninth, or Greater Aglet headed Rushe. It has a creeping spreading Root, replenished with many intricate Fibres, from which spring forth several slender naked Rushees, about a Foot and half long, full of withy Pith, and having at the bottoms of them, certain reddish Skins encompassing them, and bearing each of them at their tops, a small Carpin or Aglet, like the first Head of an Asparagus, blooming with small white Threads like a Plantain Head, which quickly fall away.

XII. The tenth, or Leffer Aglet headed Rushe. It has a creeping fibrous or stringy Root like the former, from which rise up several short Rushees, and from among them other slender and taller Rushees about a Foot high, each of them bearing
such a like Aglet as the former, but something
suffer.
XII. The eleventh, or Greater Flowering Ruth, or Greater Cyperus Ruth. It has a long creeping or spreading Root, like the Ruthes, buffing out with many fibres, from whence spring round several Ruth like Stalks two or three Cubits high, bearing at the Head or top, a large spread Leaf or Umbel of pale blue colored Flowers (which yet Traged say are white) with some Threads tinct with yellow in the middle, which falling away, there come in their place, small, round, bluish Heads, which contain within them small Seed. This Great Flowering Cyperus Ruth, as it differs from all the other sorts of Ruthes, so it excels them all in beauty, and has several Heads of Leaves rising from the Root, like to those of Cyperus.
XIV. The twelfth, or Lesser Flowering Cyperus Ruth. Its Root is fowl, whitish, and joins from whence proceeds a small Stalk of a hand breadth high, having three long sharp pointed Ruth like Leaves, two whereof rise higher than the Stalk, and of the top five Flowers, flowering one after another, after which come two small round Heads set together on each foot Stalk, of the largeness of the Candy bitter Vetch.
XV. The thirteenth, Gramen juncum communis, or Sea Ruth, or Marsh Ruth Grass, called by some Goose Corn. It has a Root which consists of many small, long, and tough Sireings, making a kind

Salmon's Herbal.

of bath as it were; from which rises up many Ruthy Leaves tough and hard, of a brown color, and well resembling Ruthes. The Stalk or Staths which are one, two, three, or more, are twice as high as the Leaves, overtopping them as it were, and are bare and naked of Leaves unto the top, which are much thicker and larger than the Leaves, on the tops of which are such Marks as an Ruthes, with many small pretty chaffy Buttons, or Heads, in which is contained the Seed.

XVI. The Places. The flowers grow in standing Waters, and by River sides, and in watery plenteous Places, and overthrown Grounds, but the first usually in the deeper Waters, not only all over England, but also in Virginia, Carolina, and other of our English Plantations in Florida. The sixth, seventh, and eighth grow in Fields and by High way sides, also in marrt and watte Grounds in all Counties of England, but the seventh more particularly. Seed found upon a high Hill in Wales, called Neverin, in several wet and moonish Grounds, in many places thereabouts: and the eighth grows in several places upon our English Coasts. The ninth and tenth, both in Hunders and England, and with us in Brooks, Ponds, and other moist places, as also in several parts of Waters. The eleventh in watery Ditches, Ponds and Patches in most parts of this Kingdom. The twelfth grows in watery and watry Places near to the Sea, in or out of Ferry Grounds, and in muddy and moist Ditches in several places in England, not far from the Sea.

XVII. The Times. The first five flourishing chiefly all the Summer to the end of September, but abide green all the Year. The sixth, seventh, and eighth flourish all the Summer Months also, and abide in like manner always green. The ninth and tenth, flourish and are to be seen towards the end of Summer. The eleventh and twelfth, Flower all the Summer long, and their Seed ripens in the mean Seacoon. The thirteenth is green, and Flowers in the Summer Months to the end of August, and its Seed is ripe in a short time after.

XX. The Qualities. Ruthes are cold and dry in the first Degree, Altringent, Narcotic and Hypnotic.

XIX. The Specification. The Root is profitable against the biting of the Phalangium; and the Seed hopes Fluxes, provokes Urine, and induces Sleep pretty strongly, flopping the most vehement Cough.

The Virtues.

XXI. The Decoction of the Root in Water. It induces Sleep, gives ease in the most vehement Coughs, stops all Fluxes of the Bowels, and the Terms in Women. The Decoction ought to be boiled two thirds away; Dose a quarter of a Pint Morning and Night.

XXII. The Powder of the Seed. Given from a Scropel to two Scropels in any fit Vehicle, it provokes Urine, induces Sleep and Rest, stops all Fluxes of the Bowels, and the Terms in Women, and eases a violent Cough; it ought to be given with Caution, lest the Patient keeps the Sleep of Death.

XXIII. The Cataplasm of the bottom of the Leaves and Roots. Being applied it is said to cure the biting of the Phalangium, or poisonous Splinters.

XXIV. Nota.
Chap. 609. English Herbs.

**XXIV. Note.** All the several sorts of Rushes have one and the same Virtues: but the Bulrushes as they are most effectual to the purposes intended, so they are only or chiefly in Use.

**CHAP. DCIX.**

**OF RUSH NUT, OR, EDIBLE CYPERUS.**

II. The Kinds. We have but one Species of this Plant, whose whole name in Greek, *Cyperus Clusor, Columns, and Dalechampius* upon Pliny, think to be the *Mamalccas, Malmehdile Thophondrus*, and that it is the *Ambalium Plinius*: it is also called *Dalecium*, and by the Italians, *Trofe*, by which name the Roots are dried up and down the Streets in Italy, as Oxen and Linants are dried here. By the Sicilians, called, *Cofianus*, because the Roots taste like Chestnuts.

**The Description.**

III. The Roots of this Plant are small, long, and round, and many of them fuller at the one end, than at the other, hanging or growing at the ends of

---

**Rush Nut without Flowers.**

Long Strings, something like to the manner of growing of the Virginia Potatoes, of a pale reddish color on the out side, and white and firm within, of the bigness of large Beans. They have a sweet Smell, no bitter or aromatick Taste, in the other Species, Cyperus or English Galangal is, but they are pleasant to the Taste, eating like Chestnuts, or rather more delicately. The Leaves of this Plant are long, and narrow like the other Cyperus's in Chap. 187, describing, with a thick Ridge in the middle, and Sharp pointed, being about half a Yard in length, from among which rise up the Stalks, smooth and without Joints, three square or triangular, very near two Feet high: at the tops of which stand half or six narrow Leaves, compressing the Stalk, and standing like a Star, out of the bottoms of which come forth pale yellowish fished Roots, which are the Flowers, and in which lies the Seed, after that their color is perfectly woofed and decayed. Where note, the Root of

---

**Rush Nut Flowering.**

that without Flowers is not so perfectly denominated as it should be, for sometimes one String has more than one, yea sometimes, two, three, or more Tubers adjoining to them as in the foll Cut.

IV. Johnson in Gerard Describes it thus. The Italian Truf is a Plant that has many small Roots, hanging at stringy Fibers, as our Ordinary Drop-wort Roots do, but they are of the bigness of a little Medal, and have one end and flat, and as it were Crowned like a Medal: and it has also several Streaks of Lines, seeming to divide it into several Parts. It is of a brownish color without, and white within, the Taste inherent is sweet almost like a Chestnut. The Leaves are very like those of the Garden Cyperus, and never exceed a Cubit in length. It is encouraged by setting the Roots, at the beginning of November, being fast fixed in Water.

V. Note. Pons in his Description of *Avene Baldus*, confidently affirms, that he had found it by experience, in fulfilling the Plant to grow up.
Salmon's Herbal. Lib. 1.

Of Saffron Garden.

The Description.

IV. Its Root grows often as great or greater than a Green Walnut, with its outward Shell or Green on it, covered with a granish or light colored...
Saffron Garden True.

Flowers are of any of the Flowers of the Wild Kinds in the following Chapter, composed of

Saffron, which do yet fist forth but one and the
same Plant, the first flowing in its prime state of
Flowering, the second in its small, long, gritty
Leaves.

V. The Place. It is a Native of England, and
in our Island the best Saffron in the World grows.
The best Saffron is said to grow at Saffron Walden
in Cambridgeshire, and places adjacent thereto,
also most excellent Saffron grows in several places
in Wales but besides it grows plentifully in Spain,
Italy, Barbary, Germany, Flinders, France, and
several other Countries of Europe.

VIII. The Qualities. It is hot in the second,
and dry in the first Degree, a little Astringent or
Binding, Digestive, Cardiac, or Cordial, Aroma-
petic, and Alepharmick.

X. The Specification. It is profitable against
Convulsions, Fainting and Swelling Fits, Palpita-
tion of the Heart, Mekals, Small Pox, Scrofulous
Fever, and the Plague or Pestilence, as also all
other Malign and Contagious Distempers: It is
said also to cure Contumacions, or Ulcers of the
Lungs, and most dangerous Affhmas, the Yellow
Jaundice, and all Diseases of the Eyes: It pro-
vokes Urine and the Terms, facilitates the Birth,
and brings away the After-birth, and causes a due
cleansing.

X. The Preparations. You may have there-
from, 1. A Powder of the Saffron. 2. An In-
fusion in Wine. 3. An Infusion in Kettle, or Na-
mark Rose Water, or Milk Water, or in Women's
Breast Milk. 4. A Tincture. 5. Tinctura Croc
Composita, A Compound Tincture of Saffron. 6.
A Spirit. 7. A Distilled Oil. 8. An Elixir, or
Essence. 9. An Oil by Infusion, or Infusion.

The Virtues.

XI. The Powder. Given from 10 Grains to a
Scrope in a little Spray of Currant Feets, or in a
Gills of Generous Wine. It is said to cure the
Affhmas, even the most dangerous Stormets of
Breath, and difficulty of Breathing, and that when
it is said that Death as it were finds at the Door.
It is also a special Remedy for Contumacies, or
Ulcers of the Lungs, taken Morning and Night,
more especially if exhibited in a half a Dram, or
a Dram of Elixir of Perfum. And given in a Gills
of Maderas, or other Generous Wine, it is said
good against Swelling, Concoils crude and raw
Humes of the Stormets, opens Obstructions of the
Lungs, Liver, Spleen, and Womb, revives the Spirits,
and clears the Heart.

XII. The Infusion in Wine. It has all the for-
mer Virtues, but is not altogether so powerful as
the Tincture following. And in the made, take
chose Canary a Quart of the left English Saffron
as Ounces, mix, and Infuse in a cold Digestion for
Two Days or more, shaking the Bottle once every
Day, let it settle, and decant the clear:

Vesels
Salmon's Herbal.

Lib. I.

Ferre pot. 3 Pints more of the same Wine, digest 4 Weeks, shaking the Bottle once every Day, and then letting it stand till it is settled, decant the clear into the former Infusion, and so keep it for use. Sixty or eighty Drops may be given of it at a time in a Glass of Wine, against Pain and Swelling of the Face or Pelleagine, as also it may be given in Briny Broth, or other proper Vehicles, as Agua Mirabilis, against the Measles, Small Pox, Spotted Fever, and the Plague or Pelleagine, as also against all other Malignt and Contagious Diseascs, both as a Prophylactic or Preventive, and as a Cureative. It provokes the Terms in Women, and facilitates the Birth of Women in Labour, bringing away the After-birth, and curative a due cleansing afterwards, but then it ought to be given from half a Spoonful to a Spoonful at a time, in a Glass of White Port Wine Mull'd, and to be repeated according to your need requires. Drop it into the Ears it is good against Pain and Deafness.

XII. The Infusion to Israel, or Damask Safe Water, or in Milkt Water, or in Women's Breaff Salt. It cures Difeases and Sores of the Eye, Blood-heat, and the like, and is of excellent use to preserve them from being hurt in the Small Pox or Measles, being droppt into, defending them from the Poxs of Humors, which is apt to fall upon them.

XIV. The Tincture. It is made by mixing an Ounce of the best English Saffron with a Quart of Spirit of Wine in a cold Digestion for 40 Days, shaking the Bottle once every Day, if half an Ounce of Cognac be added to the Saffron, and 2 Ounces of the best rectified Spirit of Salt, digesting it cold, or aerated, and then decanting the clear Tincture, it will be of double strength, and have all the Virtues of the Powder and Infusion in a superabundant manner. It clears the Heart, refills Melancholy, and evacuates the Venom of Malignt Difeases: being profitable against the very Plague or Pelleagine it falls, defending the Head, Brain, Nerves, Stomach, Heart, and Vital Powers from the Contagion, and the very extremest force of the Difease. It may be given from half a Dram to a Dram, or 2 Drums, according as the exigency requires, in any proper Vehicle. You may also make it thus, Take choice English Saffron an Ounce, Spirit of Saffron, or Tincture of Saffron a Dram, put them into a Half a Dram of Spirit of Salt, digest it cold, or in a very gentle heat for 8 or 10 Days, then decant the clear Tincture, and keep it for use. It has all the former Virtues, besides which it is good against Hysterick Fits, Convulsions, Palpation of the Heart, Sickneck at Stomach, and other like Distempers. Take Angelica, or Bitters, or Borage Water, 2 Ounces, Syrup of Cinnamon 3 Ounces, Tincture of Saffron a Dram, mix for a Cordial in Ferning and Sweating Fits, Convulsions, &c. Take Angelica Water, Treacle Water, of each an Ounce, Syrup of Chrysoprophane & 6 Drums, Tincture of Saffron a Dram and half, mix for a Dose, to be given in Malignant Fever, Small Pox, Measles, Plague, &c.

XV. Tincture Croci composta. The Compound Tincture of Saffron. Take choice English Saffron an Ounce and half, Cinnamon in fine Powder an Ounce, Cloves, Nutmegs, Virginia Snake Root, Winter's Cinnamon, More of each 6 Drums all in Powder, Spirit of Saffron, or Tincture of Salt of Tartar, 3 Drums, or something more. Spirit of Salt 2 Ounces, mix, digest in a Boh's Heathcliff Shop for 8 or 10 Days, then decant the clear Tincture and keep it for use. It has all the Virtues of the Powder, Infusion, and Simple Tincture, but is more potent to all the said purposes and intentions, and may be given in the same manner and Dose. Take Hydropur Water, choife Croci, of each 2 Ounces, Syrup of Pennyroyal an Ounce, of this Tincture 3 Drums, or more, mix them for a Dose, to facilitate the Birth, or bring away the After-birth.

XVI. Spirits of Saffron. It is made as you make Spirit of Lavender, and other like things. It sharpenes and fortifies the Heart, comforts all the Spirits, Natural, Vital, and Animal, provokes the Terms, and facilitates both Birth and After-birth. The Elixir is much better than the Spirit, being the Potpours Croci impregnated with the Saffron it fell, but it is a thing rare, or very difficult to be obtained, by reason it is so chargeable a Medicine.

XVII. The Distilled Oil of Saffron. It is Drawn like other Vegetable Oils with Water, so have you a Water and Oil of Saffron together, from which the Oil is to be separated, with a Drawing Funnal. It is very costly, for a Pound of Saffron will yield but one Dram of pure Oil. It has all the Virtues of the Powder, Tincture, and Spirit, and may be given from 2 to 6 Drops in any proper Vehicle. But some cheating People make a Counterfeit Oil of Saffron, thus, Take choice Saffron a Pound, impregnate it with Oil of Tarrentine an Ounce, Spirit of Wine to 10 Drums; Distill from Water with many Distillations, then separate the Oil from the Water. It is useful for the purposes aforesaid, and for external Distillations of the Nerves, Muscles, and Joints, as Pains, Aches, Gouts, Cramps, Palpitations, &c.

XVIII. An Elixir, or Efficace. It is made by evaporating the Tincture to a due Confidence. It has all the Virtues of the Tincture but not to potent, because of its Volatile and Spiritual parts are lost, but if the Spirit be evaporated or drawn off in Balance you may keep it for Spirit of Saffron. Take Extrah of Saffron an Ounce, Maltoluate half an Ounce, Virginia Snake Root, Cinnamon in Powder of each 3 Drums, mix them, take 1 Dram Morning and Night, against Fainting and Sweating Fits, Measles, Small Pox, Plague, difficult Labor, &c.

XIX. Oil of Saffron by Infusion or Infusion. It is Andody, comforts the Nerves, Muscles, and Joints, eases pains of the Head and Stomach, and ripens Apotlem, &c. See more of Saffron, in our Sphagnum, Or, Druggists Shop, Lib. 5. Chap. 4. Sell. 4.
CHAP. DCXI.

OF SAFFRON WILD;

Commonly called,

CROCUS.

CHAPTER I.

THE Names. It is called in Greek, Κρόκος Αλβος, in Latin, Crocos Syriacus and in English, Wild Saffron, but more commonly by our Gardiners and Herballists, Crocus, and Crocus's when speaking of the several Kinds thereof.

II. The Kinds. There are several Species of this Plant, as they are denominated from their Times or Seasons of Flowering, which are, First, those of the Vernal Kinds; or which Flower in the Spring, which are I. Those of a white Color. II. Those of a Purple Color. III. Those of a Yellow, under every one of which Colours there are several Varieties. Secondly, Those of the Autumn Kind, or which Flower in the Fall of the Leaf. The several Varieties of all these general Species are so numerous that we shall not trouble you with the Catalogue of their Names in this Paraphrase, but rather give you each of them in their order as we shall now describe them.

The Descriptions.

I. Vernal White Crocus's.

III. 1. Crocus vernalis albus perfessus minor, The Vernal or Spring smaller pure white Saffron Flower, or Crocus. Its Root (by which it is plenteously encroaved) is small, round and flat at Bottom, something White on the outside, but white within, flowering out small Sprouts on every side thereof, which is the chief Observation to know this Kind and the leffer Purple by their Roots being hard white, and differing from all other, the Roots of the Saffron or Crocos. This small Crocus springs up in the beginning of the Year, with three or four small green Leaves, something broader, and much florer than the true Saffron in the former Chapter, each Leaf having a white Line down its middle, between those Leaves out of white Skin, Rife up once or two small Flowers, confisting of Six Leaves a piece, as all the rest in general are, of a pure white Color, without any Mixture in it, which abide not in Flower over a Week or scarcely so much, so quickly is the delightful Appearance of this, and the purple Crocus, loft. It flowers not for the most part until a Month after the flowering of the yellow Crocus, and ordinary Saffron Crocus's are put. The Seed is small, round and reddish, yet not so Red as the Seed of the Yellow, contained in three cornered Heads, which yet notwithstanding, very seldom bears so as to be fruitful.

IV. 2. Crocus albus major multiflorus, The great Snow White Crocus. This greatest Saffron Flower or Crocus rises up usually with three or four green Leaves, larger than the former, with a white Line in every one of them. The Flowers are greater and more in Number, rising together, but flowering one after another, of a pure Snow White, and continuing but a little longer in Flower than the former.

V. 3. Crocus albus major alter, Alaeferos Diffar, The other great White Saffion Flower or Crocus, or Crocus of Malta. Its Root is not covered with any reddish Skin, but rather with a pale Violette or Cost. This great White Maltese Crocus rises up out of the Earth, almost as early as the first Sort of the yellow, with four or five Leaves, being very like unto the Leaves of the Yellow Crocus, and as large, with white Lines in them. The Flowers are bigger than large at the Flowers of the Yellow, and many like-white, rising one after another, like unto it, but not of so pure a white Color, as the former white Saffron, but rather tending the Alyssum or Cress Color.

VI. 4. Crocus Minor Alaeferos fundeb loosus, The great white Crocus with a few Bottons. This Kind is like unto the former in all things, saving that the bottoms of the Flowers, with some part of the Stalk next the Flower, are of a pale plains purple color, and rising up a pretty way into the Flowers; whereas another Kind of this Kind, has a little snowe, or mark of blue in, and not purple, at the bottom of the Flower only, which makes the difference.

VII. 5. Crocus albus fusci purpures, The white Crocus with a purple bottom. This is of the same Kind with the first, as well in its Root, as in its Leaf and flower, in more of them differing from it, but that in the bottom of this Flower, with that part of the short foot Stalk next unto it, is of a Violet or purple color, and sometimes having here and there some small purple Lins or Spots on the white Leaves, in Flowers also with the first White, or something later.

VIII. 6. Crocus Vernalis albus minor, The striped white Crocus. Its Root is white on the out side, like the first White, but greater, with young ones growing round about it. This Striped Crocus is likewise near a kin to the first White Kind, having the like Leaves and Flowers, somewhat larger, but failing almost as fast as they; but herein this Flower differs, that it has pale beneath Lins and Spots, in all the Leaves thereof, but more especially on the three outward Leaves.

IX. 7. Crocus Vernalis albus polymorphus vcrsp. color. The greater particolored white Crocus. Its Root is something like the Second White, but of a little more daccoy color on the out side, and not budding but on the sides, or but very little. The greater particolored Crocus has its green Leaves like unto the Second great white Crocus before described, at Sect. 5, having more Flowers than any of the former, except the Fifth great White, Crocus, in Leaves whereof have greater Stripes than the least described Crocus, but of a purple Violet color, making each Leaf seem oftentimes to have, as much purple as white in them.

X. 8. Crocus Vernalis albus versicolor minor, The leffer particolored white Crocus. Its Root is like unto the last, and its Leaves and Flowers, are for their biggest equal in a manner with them; but it has not so many Flowers rising together from the Root. The Flower is finely marked with purple Stripes on the white Leaves, but nothing so much as in the former.

XI. 9. Crocus Epipolalis, The Bishops Crocus. This flower is particolored, and is very like both in the Leaves and Roots unto the Neapolitan white Crocus, but something larger. The Leaves are less than not so long, a time blown, and have all their Leaves wholly white, with blue Stripes on both sides of them, or solely of a fine delicate Blue Violet color, and the three stamens most blew, and finely striped on their infides and outides, and sometimes it has been seen to have 3 Leaves white, and 3 Leaves of a pale...
II. Vernal Purple Crocus.

XVII. 16. Crocus Vernus purpuratus major. The smaller purple Crocus. This has its Root, and green Leaves so like unto the first White Flower’d Crocus, that they can scarce be distinguished, only this seems to be a little narrower. The flower is also much about the same bigness, or a little bigger, and seldom bears above one Flower from a Root, even as the first does, of a deep purple Violet color, the bottom of the Flower with the upper part of the Stalk thereunto, being of a deeper or blacker purple, in the middle of the flower, are some small pale Crocus, tips with yellow Venetian, and a longer Pointed, divided or forked at the top. It bears Seed very sparingly as the White does, and is reddish like unto it, but compleetly that deft with a plentiful excess of the Root, and flowerers at the bottom of the Flower, with the White, and occurring a little a while. Its root is in all things like unto the first White, that it is impossible for the withest and most correctest therein, to know the one from the other.

XIX. 17. Crocus Vernus purpuratus maximum. The greatest purple Crocus. Its Root is like unto that of the Green blew Neapolitan Crocus, which is the most exact it and the same Head for springing in it, is scarcely to be discerned. It is of the same Kind with the Neapolitan as well in its Leaf as its Root, but greater for the green Leaves hereof are the greatest and broadest of all the Crocus’s, with a large white Line in the middle of every one: it springs up much later than the former, and does not form its Flower till a good while after the other is past. The Flower also are the largest of all the Spring Crocus’s, and equaling, if not surpassing that Purple Kind which flowerers in Autumn, hereafter described, of a very fair, and deep Violet color, almost as deep as the former. The Seed Vellets are large also and white, in which is contained pale reddish Seed, like unto the Neapolitan blew Kind, but something greater.

XX. 18. Crocus Vernus purpuratus after Apicellbus albidus. The purple Crocus the tops of whose Flowers are whitish. This Species of the Purple, but the tops of its purple Flowers whitish or Apicellbus albidus albidus, grows and abides constant every Year in that manner, and in that thing it only or chiefly differs from the last before described, being of the same Species.

XXI. 19. Crocus Vernus purpuratus, var. Ceartum major. The greater blew Crocus of Naples, or Greater Neapolitan blew Crocus. Its Root is not very great, but a little dark on the outside, being round and flat method, so that one can hardly know which is the upper side thereof. It rises up with driver green Leaves broader than any of the former, except the Parapus maximus at Sect. 19. above, consisting of six Leaves apiece, of a pale bluish violet color than in the said Maximum, having in the middle of the flowers, a few pale Threads tips with yellow, and a longer Pointed of a gold yellow color, forked or divided at the top, smething faster sooner than the Maximum, and abiding a great while longer, being in flower suitably even with the Short yellow Crocus, or before the Maximum, and yielding greater plenty of Seed.

XVIII. 16. Crocus Vernus purpuratus minor. The smaller purple Crocus. This has its Root, and green Leaves so like unto the first White Flower’d Crocus, that they can scarce be distinguished, only this seems to be a little narrower. The flower is also much about the same bigness, or a little bigger, and seldom bears above one Flower from a Root, even as the first does, of a deep purple Violet color, the bottom of the Flower with the upper part of the Stalk thereunto, being of a deeper or blacker purple, in the middle of the flower, are some small pale Crocus, tips with yellow Venetian, and a longer Pointed, divided or forked at the top. It bears Seed very sparingly as the White does, and is reddish like unto it, but compleetly that deft with a plentiful excess of the Root, and flowerers at the bottom of the Flower, with the White, and occurring a little a while. Its root is in all things like unto the first White, that it is impossible for the withest and most correctest therein, to know the one from the other.

XIII. 11. Crocus Vernus purpuratus Tarifae. The Tanks repugnate Crocus. The flower of this Kind is a little larger, and of a deeper purple color, both on the infe, and on the outsides the green Leaf is also bigger, and of a more whitish hue.

XIV. 12. Crocus Vernus caputfolo folo. The final Leaf’s, or Gris Leaf’d white Crocus. This White Crocus is in all things like unto the purple of the same Kind in Sect. 27. following, but that the flower of this is much shrivel, the full Description whereas, therefore we shall here forbear, for that you will have it large in the said Sect. 27. to which I refer you.

XV. 13. Crocus plurans pallidus. The pale Feathered Crocus. It is something like the White Crocus Maximus, but larger, and not so round pointed. The Stalk and bottom of the flower is also, like unto it. The three outward Leaves are all white, or Silver colored, and on their infe, finely strip’d, with smaller and longer Stripes of a pale blusht purple. The three inner Leaves are frill’d with the same color, but smaller on both the sides thereof; this is not so common as many of the others are, and is indeed one of the best we have.

XVI. 14. Crocus Imperialis. The Imperial Crocus. It has many Flowers arising from one Root, which are of a Silver color, strip’d on the backs of the Leaves with purple, which when they are open, are seen through on the other side. This encodes so far, that it is grown very common. Of this Kind there are two other, the one larger, and the other smaller, and of the same fashion, and color, and marking.

XVII. 15. Crocus Regalis. The Royal Crocus. It is like to the Imperial but larger, and better strip’d with deep purple, more especially in the backs of the three outward Leave. From the Seeds of this, several varieties have been rais’d, differing from the Original, being larger, others smaller, and strip’d with deeper or paler purple: but in all these Flowers the White has the Mellerly, and therefore are numbered with that color.
XXII. 20. Crocus Neapolitanus praecox, the more early Neapolitan Crocus. This Species offers very little from the former, either in its Roots, Leaves, or Flowers, with any difference but its Colour being a little blander, or paler yellow, and that it flowers something earlier.

XXII. 21. Crocus Versus purpureus striatus. The Bristly Purple Crocus. The finest and most delicate into the first Neapolitan, and Flowers much about the same time with it: its Leaves are also as large and broad as those of the former, and rather a little longer. The Flowers are also as plentiful and as large, of a fine Diluted Purple Colour on the outside, with three broad stripes or lines down the back of the three outward Leaves, and of a little deeper Purple on the inside, in the other three Leaves also are, and striped with the same deep Purple about the ground or bottom of the Leaves. This Sometimes yields three Square Heads, containing in them brownish Seed. The Silver striped Purple Crocus. The Root of this is not so flat as that of the Neapolitan, the like, it, and covered with a darkish Coloured Skin. It is in its Before described, but a little smaller: The Flowers are of a little deeper Purple through the whole Leaves, stripped with white or Light, but in the Leaves they are sprinkled with a few White Stripes from the outside, and in it a peculiar Species from all the rest, and it flowers about the same time.

XXV. 22. Crocus Purpuratus Flammatus major. The greater Purple Flame Coloured Crocus. Its Root is White on the outside, somewhat flat and round, but not so flat as the Neapolitan Crocus before described. Its green Leaves are as long as in the former, and of a large flat red. Its Flowers are somewhat more copious, with a fair broad white Line down their middle, but not rising out of the Ground so early as the next described Crocus. The Flowers are like-wise of a mean bigger, of a pale Purple on the outside, something whitish, especially the three outward Leaves, but on the inside of a deeper Purple, and striped with great Stripes like Banners, having some Heads in the middle, and a longer one also feathered a little at the top.

XXVII. 24. Crocus Purpuratus Flammatus minor. The lesser Purple Flame Coloured Crocus. Its Root is very like unto the former, but a little lesser. It has almost as broad and long green Leaves as the former, and of the same Greenness, which rise up earlier than they. It is in Flower something of a reasonable length and breadth, and, of a White or Light Greenness, with a fair broad white Line down their middle, but not rising out of the Ground so early as the next described Crocus. The Flowers are like-wise of a mean bigger, of a pale Purple on the outside, something whitish, especially the three outward Leaves, but on the inside of a deeper Purple, and striped with great Stripes like Banners, having some Heads in the middle, and a longer one also feathered a little at the top.

XXVII. 25. Crocus Purpuratus Capillus-rufus. The Purple Crocus, with small or almost Grafs like Leaves. Its Root is very small and round, having one flat at bottom thinner than the other, very like the Roots of Colchicum, or Medow-Saffron, and something near resembling also the Hook of an Horde Root, covered with a very thick Skin, of a dark or blackish brown Colour. This Small Crocus rises out of the Earth with two or three long and small green Leaves, very like unto the Leaves of the fine Feathered-Grafs, as long and round as at first, but afterwards lying upon the Ground. From among which, come forth the Flowers, sometimes three, but most usually two upon one Stalk, if the Root be not Young, which is generally the case in a Stalk, which is very short, so that the Flowers scarcely rise above the Ground, yet lying themselves open in the Day time at it is Fair, and the Sun Shining, otherwise they remain close, and open at all.

After one Flower is past, which does not continue above 3 or 4 Days at most, the others follow, which are of a bleaker bluish Purple in the middle of the Flowers, and of a deeper Purple towards the points of the Leaves, but of a more dull or dark Purple on their outsides, and yellowish at bottom, with some yellow Points in the middle. The Seed is finally, and darker coloured than any of the Flowers of the Crocus, contained of a finer smaller Heads, standing one by another upon the same short foot-stalk, which then riseth up a little higher, showing the manner of the flowering of the Flowers, which in their flowering time could not so easily be discerned. This Flowers the left of all the former sorts of Crocus's, even when they are all past.

XXVIII. 26. Crocus Versus Purpureus Striatus Capilifolius. The Striped Purple Crocus with Capillary or small Leaves. The Root of this is somewhat larger than the former, and rounder, but covered with a thick and as brown a Skin. This small Crocus has such like Leaves as the last Described, from among which, riseth up the Flower upon a short foot-stalk, confiding of six Leaves like the former, of a fair Purple color on the outside of the outward Leaves, with three Lines or Streaks down each Leaf, of a deeper Purple color, and on the inside of a paler Purple, as the other three Leaves also are, with some Flowers in the middle, and a forked Point in the middle. It flowers about the same time with the former.

XXIX. 27. Crocus Phaeanthus Purpuratus. The Purple Feathered Crocus. This is like the greater Purple, but a little bigger and rounder pointed, the three outward Leaves of the Flowers, are of the same Purple color, and feathered with white on both sides thereof, the three inner Leaves are thick striped with White upon a paler Purple on both sides likewise: And this is accounted the last of all the sorts of Crocus's, which have brought to our knowledge.

III. Vernal Yellow Crocus's.

XXX. 28. Crocus Versus lentus, five Medicus. The yellow Crocus, or Median Crocus. Its Root is great and round, as great or greater than a Wallnut sometime, and covered with reddish Skins or Coats. It rises up with 3 or 4 Leaves out of the Ground, being somewhat near the breadth of the Great purple Kinds, with a white Line in them, as in most of the rest. The Flowers grow out of the middle of these Leaves, and are very large, of a pale yellow color, with some Chromes, and a forked Point in the middle. The Seed hereof is of a brighter color, than in any of the other. This Plant yields more flowers of Flowers than most of the former, and begins to blow with the first sorts, or presently after, yet out many of them, the Flowers being of a pleasant good Smell.

XXXI. 29. Crocus Versus lentus Florae aureae. The yellow Crocus of a deeper Gold yellow color. This is of the same Kind with the former, but its Flowers are of a deeper Gold yellow, so deep, that they appear reddish with a purplish tint.

XXXII. 30. Crocus Versus lentus Florae pallidi. The pale yellow Crocus. This is another Kind very like the former, whose Flowers are very pale, between a white and a yellow, but not differing from it, in any thing else.

XXXIII. 31. Crocus Versus lentus Florae viridaneae. The greenish yellow Crocus. This is a Crocus something smaller than the former, and
its Flower has a flow of prennensis in the yellow, and also more green at the bottom.

XXXIV. 32. Crocus Vernus latius maximus. The greatest yellow Crocus. This is like the first yellow Crocus at Sept. XXX., above, being a variety raised from the Seeds thereof. The Flowers are of a deep yellow color, and as large as the Greatest Purple, for which thing it is very much esteemed.

XXXV. 33. Crocus Vernus flavus furfuraceus. The yellow Briped Crocus. Its Root is very like the Root of the first yellow Crocus at Sept. XXX., differing but being smaller and shorter, and covered with the like reddish Skin, but a little fatter. It rises up with a greater flore of narrower and greener Leaves than the first Yellow, and after the Leaves are spread, many yellow Flowers rise up from among them, which are not so bright and yellow color, but more dead or dull, being on the backside of each of the three outermost Leaves, 3 small Stripes of an orange or dull purple color, with some Chives, and a Point in the middle. If Flowers not so early as the first Yellow, but abides almost as long as it.

XXXVI. 34. Crocus Vernus lacteus versicolor primus. The next Cloth of Gold Crocus. Its Root is easily Lacteous from the Roots of any other Crocus, because the outward Feelings or Shells, are hard and as it were Nettled on the outward, having certain Ribs, rising up higher than the rest of the Skin, made in the form of Nettles, of a dark brown color, and withal, it is smaller and rounder than the former Yellow, and encroaches not so plentifully on the Root. This is the same Cloth of Gold Crocus, and rises up very early, even with the first Crocus, with 3 or 4 very narrow and short Leaves, of a whiter color than any of the former, which quickly after sends forth its Flowers, rising from among the Leaves out of the same white Skin, which includes also the said Leaves, but they are not so plentiful as the former Yellow, being but 2 or 3 at most, of a fair Gold yellow color, yet something paler than the Full Yellow, hanging on the back of the three outermost Leaves, 3 fair and great Stripes, of a fair deep purple color, with some small Lines at the sides or edges of these purple Stripes. On the inside of these Flowers there is no skim or skin of any Line or Spot, but wholly of a fair Gold yellow, with Chives, and a greater Point in the middle. The Seed of this is like the former, but not so red.

XXXVII. 35. Crocus Vernus lacteus versicolor alter. The second Cloth of Gold Crocus, or Duke Crocus. There is no difference either in the Root, Leaf, or color of the Flowers, or time of flowering, in this Kind, from the last before described; in the Flowers of this are of the same bigness and color, the chief variation of this from that, being in the marking of the three outward Leaves, which in this have not 3 Stripes as they have, but wholly of the same deep purple color on their back, saving that their edges are yellow, which is the form of a Duke Tulep, from whence came the name of a Duke Crocus.

XXXVIII. 36. Crocus Vernus versicolor palidos lacteae. The pale Cloth of Gold Crocus. The Root of this is Nettled like the others, which shows that this is but a variation of the same Kind. This third sort of Gold Crocus has Leaves and Flowers like the former, but differs in this, that the color of the Flower is of a paler yellow by much, but striped in the same manner as the rest of this Kind, with a fainter purple color.

XXXIX. 37. Crocus Vernus versicolor albo dilutus. The Cloth of Silver Crocus. The Root of this is also Nettled as the others are, which shows it to be a variety of the same Kind. The chiefest note

do difference in this is, that being so large a Flower as any of the former of this Kind, it is of so pale a yellowish white, that it is more white than yellow, which some do call a Butter color. The 3 outward Leaves are striped on their back with a pale blue fingering color, the bottom of the Flower, and the upper part of the stalk, being of the same pale blue color.

IV. Autumnal Crocuses.

XL. 38. Crocus Byzantinus argenteus. The Silver colored Autumn Crocus. Its Root is pretty big, and rounder than any other Crocus, without any Extremities. At the end of the month, the Flowers are blown, and after, being larger than the other, the Leaves then appear, and are at the leaf end, being of a silver blue color, which many call a Silver color, the third innermost Leaves being of a pure White, with some yellow Chives in the middle, and a longer Pointed, ragged or feathered at the top. This very seldom bears Seed, but when the Year falls out to be very mild, and then it is small, round, and of a Dark color.

XLI. 39. Crocus Yorkshire Purpurascens, or Purple Mountain Crocus. Its Root is small and white on the outside, so like unto the Root of the Nefer Vulnus Purple or White Crocus, but not so plentiful, that it cannot be distinguished, until about the end of August, when it does begin to flower, and then by the early blooming up a white long Sprout for Flowers, it may be known. This Purple Crocus rises up but with one Flower usually, but sometimes with two, one after another, without any Leaves at all, sometimes in August, and generally in September, standing upon a lower Footstalk than any other kind of Crocus's, either of the Spring or Autumn, and is as large as the Flower of the Nefer Vulnus Purple Crocus, of a very deep Violet Purple color, and not decays after it has bloomed three or four Days, and becomes more pale, having in the middle some yellow Chives, and a long feather-like Pointed, branched, and rising sometimes over the edges of the Flowers. About a Month after the Flowers are past, and sometimes not until the beginning of the Spring, there rise up three or four long and broad green Leaves, with a white Line, and blue or reddish flower above them, like unto the first Vulnus Purple kinds, which abide until the end of May or June. It has not been offered to give any Seed, the Winter coming so quickly on after the Flowering, which hinders its coming to Perfection.

XLII. 40. Crocus Mountaini Autumnalis, or Autumn Mountain Crocus. Its Root is very great and not buttoned, covered with a darkish Green Skin or Shin, and very little, or seldom encroaches. It Springs up later than any of the former, and does not appear until the middle or end of October, when the Flowers of the former are past, appearing first with three or four flat green Leaves, like unto the Byzantinus Crocus, and afterwards the Flowers between them, which are of a pale or bleak color, appearing volume, and their backfales being so short, that at first they scarcely appear above Ground, but two or three Days after, they grow a little higher.

XIII. The Places. Some of these have been found out in one Country, and some in another, as the
**Chap. 612. English Herbs.**

The Purple and White, and Stripe White in Spain. The Yellow in Medo about Belgrade; the greatest Purple in Italy. But the several places of such Plants, or in part set down in their Titles, the help of Friends, and proper extremely well with us, and flourish as well in our Gardens, as in their Native Places. But this is to be observed, that some of the Species here described in this Chapter, have been raised up by us, from the Sowing of their Seed. The bulb placed to plant Spring Crocus's in, is close up to a Wall or Pale, or by the edges of Border Boards, round about the Garden, mingling the Colors of those of a Saffron together, as the Whites with the Purples. The bulb of Gold, with the Royal, the deep Purple Feather'd, with the Lighter, and so of the rest. By Observation, most of them may be distinguished by their Roots, and so placed according to the Mind of the Planter; but the aforementioned places are heft, for that few other Flowers appear until they are put. Should they be set among Tulip's, the Grassy Leaves after the Flowers are gone, would more miserable and disgrace the place, than the Flowers did before Adorn it.

**XLIV. The Times.** Their several Times are also exprest in their Descriptions, for some bring forth their Delightful Flowers in the Spring, in which for the first three Months, our Gardens are furnished with one Variety or another: The others in Autumn, so that both early and late in the Year, we have an Ornamental Appearance. All these several Crocus's, both of Spring and Autumn, lose their Fibres with their Leaves, and must then be taken up and kept dry, tho' of Autumn until August, and of the Spring, until October. They are hardy, and will prosper in any place. The Vernal increase exceedingly, if they stand any time unremoved; but the Autumnal encrease very little. Many more Varieties than are yet Discovered, may be raised from the Seeds of the best Kinds, being Sowed in September, and every other Year in July removed and set wider, until they bear Flowers, making the Ground light and rich, unto which you transplant them, which will make a great addition to their Beauty.

**XLV. As to their Qualities, Specification, Preparations and Virtues, Authors have said nothing, nor do we know anything of them by Experience:** They are the Florists property, and more used as Ornaments for the Adorning of Gardens, than for any thing else; and if Witly managed, will give a Singular Delight and Pleasure to the Eyes of the Beholders. And for this Reason it was that we took this Trouble upon us, to inform them into this Herbal.

---

**CHAP. DCXII.**

**OF SAFFRON-MEDOW, OR COLCHICUM.**

I. **THE Name.** It is called by the Greeks, *Colchicum*. (6 Named from the Island Colchis, where it was first found growing) also by Saffron, from its Killing in one day's Space; in Latin, *Col*.

---

**Saffron Medow English White.**
Salmon's Herbal. Lib. 1.

We make here (as the Springs, and one other) to bear their
Flowers alone in Autumn, or later, without any
Green Leaves with them, and afterwards in February
any their Green Leaves. So that we shall not need to
make many long Descriptions, but having given
you a full Description of the first, to show you the
differences, which chiefly consist in the Leaves and
color of the Flowers, and so briefly to pass from
one to another, taking notice only of those Variati-
one which are most worthy of Note. The Root of
this our first English kind, is Bulbous or round, and
is White within, but without covered with a thick
blackish Skin or Coat, having one side thereof, at
the bottom, larger than the other, with an hollow-
ness off on the one side of that long Eminence, where
the Flowers rise from the bottom, and shooting
down therefrom a number of White Vines, by
which it is fastned in the Ground. This Root re-
mains in the Earth, without shown of Leaf above
Ground, till part of the Winter, and in February
there Spring forth from it, three or four large and
long green Leaves, rising from the top or head of
the Root, long after the time of its blossoming, which
is in the Autumn before (These Leaves when they are
fully grown up, stand on the top of a round, weak,
green and flout Stalks, something like unto the
Leaves of White Lilies, but not so large; and in
the midst of these Leaves, after they have been up
some time, appear two or three large Skinny Heads,
standing in the midst of the Leaves, upon short
thick green Stalks, which being ripe, contain in
them small round brown Seed, which lies as it
were loose therein, and when the Head is dry, be-
ing shaken, may be heard to rattle. But the Flow-
ers which are not more than three or four at

English Purple Meadow Saffron.

well, appeared the Autumn before, or just before
Winter, shooting fiercely upon weak Beakside,
a hundred length or more above the Earth,
consist of fix white Leaves, something long and
round, and not so large as most of the other kinds,
with some Threads or Chives in the middle, into
the Spring Crocuses in the former Chapters,
without any color of Saffron in them, or any
Saffron like Virtues: These Flowers being puff,
The Leaves appear not yet, but the Root lying within the
Earth appearance of them, most part of the Winter,
attracted by their afterwards Spring up in February, 9th or 10th
before declared.

IV. 2. Colchicum Angicicum pappuratum, The Pur-
ple English Colchicum, or Meadow Saffron. This
both in its Roots, Flowers, Leaves and Seed, Aug-
made, manner and form of Growing, differs not
at all from the former, facing only in the color of
the Flowers, which as they in the first were true
White, are in this of a diluted Purple Color, with
a small appearance of Vines therein.

V. 3. Colchicum Pannonicum album, The White
Hungary Meadow Saffron. This in its Root, Leaf,
Flower, manner and form of Growing, is like to
the first or White English Colchicum, the greatest
difference between that and this is, that the former
White, is in all particulars better than this, and
besides, this has but a greater store of Flowers
altogether, which continue longer in their Beauty,
unto the Spring Crocuses in the former, and are also
something of a fairer white color.

VI. 4. Colchicum Pannonicum purpureum, Purple
Hungary Meadow Saffron. It is something like as
to the White of this kind, but that it bears not
do plentifully as the White does, nor does the Root
grow so great, but the Flowers are in a manner
as large as they, and of the like Pale diluted Purple
color, or somewhat deeper, as is in the White
English, with some Vines or marks upon the Flow-
ers, making some them of a checker on the out-side,
but not so conspicuous as in the true chequer'd
kinds.

VII. 5. Colchicum Pannonicum varicolor, Party
coloured Hungarian Meadow Saffron. This is a
Species of the fourth or last kind before Described,
and differs only from it in this, that the Flowers
hereof are Party-colored with white Streaks and
Egges, which adds confusion: It is thought that this
was first raised from the Seeds of the former.

VIII. 6. Colchicum Byzantinum, The Byzantine
or Constantinople Meadow Saffron. Its Root is in the
middle greater and rounder than the others, with
a longer Eminence, whereby it may be easily
known from all other sorts. Its Leaves are fo
broad and large, so that one who had never
seen Colchicum, could hardly judge it to be a
Species thereof, for that they are much larger
than any Lily Leaves, and of a dark green
Color. The Flowers are correspondent to the Leaves,
larger, and more in number than in any of the
former Purple kinds, of the same color with the
leaf Purple kind, but of a little deeper Purple
on the inside, with divers Marks running thrid
the Flowers, like unto it, or like to Chequer,
but yet somewhat more apparently.

IX. 7. Colchicum
The true Greek Colchicum.

like to the Leaves of Lycoris, from among which Leaves, some forth yellowish Flowers, very like to the English Colchicum, or Medow Saffron, but smaller.

X. 8. Colchicum Leucanthemum Fruticosum, The Portugal Chequered Medow Saffron. Its Root is like to the Root of the English or Hungarian, without any Difference, but that this grows something greater. Its Leaves do rise up faster than in any other of the Autumn kinds, for they are always up before Winter, and are four or five in Number, short rather than long, broad below, and pointed at the end, canaled or bollotent, and standing round above the Ground, one encompassing another at the bottom, like the great Spanish Saffron Jacob, called the Jacob of Peru, but shorter, and of a pale or greyish green color, differing from the color of all the other Medow Saffrons. The Flowers are larger and longer than in the Flowers of either English or Hungarian, and almost as large as the faith kind at Sei. VIII. foregoing, and of the same color, but a little deeper; the Spots and Marks thereon, are somewhat more pale to be from own same off, like unto the Flowers of a Frillitary, from whence it took part of its Name. This is one of the first Medow Saffrons, or Colchicums which Flowers in the Spring.
Salmon's Herbal.

XLIII. 16. Colchicum Hermodaflidum. The great single

blowery, like Medow Saffron, but has a bulbous or round

Root, not much unlike to the Hermodaflidum, (which in

truth is no Hermodaflid, but Colchicum.) It springs up

within its Leaves in Autumn, before its Flowers appear,

which none of the former kinds do. The Flowers

does (after the Leaves are up) flow in feft in the

middle of them, consisting of five white Leaves, with

dark fides to the middle, and paffes away with

out giving any Seed, that has yet been observed.

The Green Leaves abide all Winter and Spring

following, decaying about May, and appear, or

Spring not up again until September following,

when (as is said) the Flowers bloom from thence, and

that presently after the Leaves are Sprung up.

XIII. 17. Colchicum atropurpureum: Dark Purp
dle-colored Medow Saffron. Its Root, as after its

Seed, are like to thefe of the English purple kind.

The greatfeft difference in this Species, confifts in the

Flower, which at the fift appearance, it of as

pale a Purple as the Flower of the former Hunga-

rian kind, but after it has flown in flowers two or

three Days, it begins to change, and will after a

while, become of a very deep reddish Purple, as also

the little Footstalk on which it does flow. The

Flower is of the bignefs of the Hungarian purple,

and at of the fmall green Leaves.

XX. 18. Colchicum atropurpureum variegatum: The

Party colored dark purple Medow Saffron. This

is another fort of the former kind, differing

chiefly in the Flowers, which is varieflly perfifted

every Leaf of the Flower, with a pale Purple color,

so that the Flower is of great Beauty. This might

seem to be a degenerate Plant from the former, but

that it has abode confiant in its appearance, in some

Gardens for many Years, and gives Seed as plenti-

fully as the former.

XXI. 19. Colchicum flore pleno: Double Flowe-

er'd Medow Saffron. This in its Root and Leaf,

is very like unto the English kind, the flowerers are

d of a fmall, pale, diluted color, confifting of many

Leaves, and thick together, which are somewhat

smaller, as in the English flower, being narrow and

long, and as it were round at the points, which

make a very double flower, having fome pretty with

their yellow Tops, defigned as it were among the

Leaves in the middle. It flows in September,

a little after the first flower of the former Medow

Saffrons are pulled.

XXII. 20. Colchicum variatatum pluriflorum: The

Party colored double Medow Saffron. This

Plant is diverflified from the former in the dividing

of its colors, as it feen in the fingle party colored

Medow Saffron before Deftributed, having four

Leaves white, and others pale purple, and fome

Leaves half white and half purple, differently set or

placed in the double Flowers, which does confift of

as many Leaves as the former, yet sometimes this

Plant does not then is feft double like the former,

but has two flowers, one rifeing out of another, making each of them to be almost

but fingle flowers, confifting but of eight or ten

Leaves appeare. But this diverflity is not confident,

for the fame Root, which this Year appears in that

manner, will the next Year return to its former

kind of double flowers again.

XXIII. 21. Colchicum variatatum dalmaticum Agri-

pina: The varigated Medow Saffron, commonly

called Agripina. This is of later Discovery than

the red, and has more Variety than any of the for-

mer, the Difference chiefly confifing in the color,

and marking of the Flowers, which in this, are

White and Red interlarded, or varigated like a

Tulip.

XXIV. 22. Col-
Medlow Saffions of the Spring.

XXV. 23. Colchicum Vernum flore carmine: Spring Medow Saffron, of a pale red or deep bluish color. In Root is small, something like unto the Roots of the former, but shorter, and not having so long an Eminence on one side of the bottom. It rises up very early in the Year, viz. in the end of January sometimes, or in the beginning of February, or middle thereof at first, presently after the deep froze and Snows are past, with its Leaves included within three green Leaues, which opening themselves, as soon almost as they are out of the Ground, show their Buds for Flowers within them: very white oftentimes before they open, and sometimes also purplish at their first appearing, which never within those two or three weeks after one Root; and never rise above the Leaves, nor the Leavings much higher than they, while they last. The flowers consist of six Leaves, long and narrow, every Leaf being divided baser round the bottom and top each from other, and joined together only in the middle, having also six Chives, trip with yellow in the middle, every Chive being jointed to its proper Leaf, which is of a pale red, or deep bluish color, where it has a white bluish, and is a smaller Flower than any other Medow Saffron, except the small Spanish kind only, but contains in its beauty a considerable time, if the extremity of sharp Frosts do not spoil it. The Leaves wherein these Flowers are included, at their first coming up, are of a brownish green color, which fades for a while, especially on the outside, but on the inside they are hollow, and of a whiteish or greyish green color, which after the Flowers are past, grow to be of the length of a Finger, and to be middle finger, and narrow mithral. There rises up likewise in their middle, the Head on each Side, which is smaller and shorter and broader than any of the former, in which is contained small round brown Seed.

XXVI. 2. Colchicum Vernum atropurpureum: Purple Medow Saffron of the Spring. The Flower of this, is in the rising up of its Leaves and Flowers together, and in all things else, like unto the former, only the Flowers of this kind, are at their first appearing, of a deeper Purple color, and when they are blown, are of such deeper than the former, divided in like manner both at bottoms and tops, as the other are, so that they seem, like as if six large Leaves were joined in the middle parts to make one Flower: it has also, it small Chives trip with yellow, closing in the like manner to every Leaf.

XXVII. The Places. Where they all grow naturally, is explicated in the Title of almost every Plant: Some grow in Fields and Meadows, and Champion Grounds, and some on Mountains and hilly Grounds. The English kind grows in the West Parts of our Land, as about Bath, Bristol, Manchester, and Liverpool, and other places also. The Double kinds are said to be brought out of Germany, all the Foreign kinds have been transplanted from their Native Soil into our Gardens, where they now grow as well as in their Natural places.
The Kinds of the Manured. It is threefold.

1. Cnicus Sativus, or Urbanus, Cnicus sativus Carthamus vulgaris, our most common or Manured Baldard Saffron, or Carthamus, which is also called Saff-Hower, and is a peculiar Name, distinguishing it from all the other kinds. 2. Cnicus singulatus Alpinus, Cnicus alter Cnicus, Baldard Saffron of Candy. 3. Cnicus alter Carthusianum flore Clusii, (as most Authors call it) and Cnicus alter perennialis Clusii, Clusius his Everlasting Baldard Saffron. There are the chief Manured Kinds yet taken notice of.

IV. The Kinds of the Amaryllis, or Wild Cnicus. Of this there are three sorts. 1. Argophom of Saffron, Amaryllis, Amaryllis flore Luteo, Cnicus alter Clusii, (because it is so like the first Cnicus Sativus) Cnicus carulescus Carthamus, Lobelii, Lysimachii, adormaqua: The yellow Wild Carthamus, or Cnicus, or Doffald Thistle. 2. Amaryllis flore Purpureo, Purple Doffald Thistle. 3. Amaryllis purpuracea Cyprica, Purple Doffald Thistle of Cyprus.

The Descriptions:

I. Garden Cnicus, Carthamus, or Saff-Flower.

V. The first, or our own, Manured Baldard Saffron, or Carthamus Sativus, called also Spanish Baldard Saffron, and Saff-Flower. It is a

Root which is long, hard, and woody, perforing quickly with the first frosts, or after seed time.

Saffron Baldard Garden.

4 feet high, with shorter Leaves throned up to the top, and towards the top branching it self, which bear yet shorter Leaves, sharp pointed, and sometimes prickly about the edges, bearing at the end of each Branch, a great open scaly Head, of which come forth a great many Gold Thorns, or Threads, of a warm Orient and Shining color, which being gathered in a warm dry time, and kept dry, well dried, in the same delicate color, (which does not whiten freshly) for a long time: And this Flower is that which is called Saff-Flower, and Sold for the same every where by our Druggists and Day-Salters. It is Manured in Spain for the part which is made of it, for the Dying of Silks and other things, and for the Merchandize thereof, Transferring great Quantities of it into several other Countries, but the flower which grows both as here in England in our Gardens, are of a lower and more lively color. When the Flowers are full, the Seed comes, which when it has attained its Maturity, is white and hard, somewhat long and round, and a little corner'd.

VI. The second or Baldard Saffron of Candy. Its Root is thick, long and black, from whence rises up one fruit round Stalk, half a Cubit high, or somewhat more; set here and there with long sharp pointed Leaves, thick set with Prickles at the Dents of the Edges: At the top of this Stalk grows a scaly Head, encompassed with prickly Leaves, of the bigness of the Amaryllis or Doffald Thistle, out of which spring forth a great many thick, yellow Saffron like Threads, close shrapt together, after which comes the Seed, which grows therein, of a white color, and as large as the Seed of the Greatest Century.

VII. The Third, or Clusius his Everlasting Baldard Saffron. Its Root runs down deep into the Ground, and being there increased, does run and

Saffron Baldard Everlasting.
II. Wild Baftard Saffron, Atracylys Or Dissaff Thistle.

VIII. The first of this Wild Kind, or Yellow Wild Carthusian, Calcus or Dissaff Thistle. Its root is velvety and very, profively every Year after Seed time. Its lower Leaves are wavy, long and narrow, very much cut in on the Edges, very hairy, or as it were a little hairy, and not prickly, which they are Young, and before the Stalk rises up, but then are harder and more prickly; and still the higher, the more sharp Jct with Prickles, which rising to be three or four Feet high, are round and branched from the middle upwards, and has at the top of every Branch, a few smaller, but more prickly Leaves, under every prickly Head, which from their middles, float forth a few pale yellow Threads, which are the Flowers, and being full, have in them several blackish hard Seeds, four or what larger than those of the Garden Calcus or Carthusian, but lesser than those of the Buffal Saffron of Cardye, lodged in Dean, but nothing so much in it. The Leaves here of being gently broken (but not bruised) here, they grow hard and old, will yield a reddish or bloody Juice.

IX. The Second, or Purple Dissaff Thistle. This differs not from the last in the form of the Flower, but only in its color, being of a purplish Red, nor in its Leaves, housing that these are not hairy or hairy, nor in its Stalk, excepting that it seldom rises so high. In all other things it is as like the former, even cured in the Bloody Juice also, that one would say (without a particular Observation,) that it were the very same plant.

X. The Third, or Purple Dissaff Thistle of Cyprus. The whole Stalk and Branches rise to be about a foot and a half in height, it has Leaves like unto the Garden or Manured Calcus or Buffal Saffron, but softer, and something Rugged or Crumpled, from among which rises up the Stalks about 2 feet, bearing a Thistle-like head at the Top, which stands forth also from the Branche bare or without Leaves, half a foot long or more, having on each of them a small prickly Head, like that on the top of the main Stalk. The Flowers are Purple on the middle, but in some Countries enlacing to yellow: and the seed is White, like that of Calcus or Carthusian Saffron, or Garden Buffal Saffron.

XI. The Places. The first of the Garden Kinds are Sown in Fields in divers places of Spain, Italy, Germany, England and France: but Pliny, Lib. 25, Cap. 17, says that in the Reign of Vespasian it was not known in Italy; and is accounted by Theophrasus and Dioscorides to be a Manured Plant, so generally Sown for the many uses thereof. The second Alpinus says was brought out of Cardye. The Third is a Native of Spain about Sevil and Cordova, and as Calcus says, grows in other places; Pena says upon Mount Balda.

XII. The Wild Buffal Saffron or Dissaff Thistle. The first Species there of Calcus says grows about Sevil and Cordova in Spain. The second and Third kinds grow in many Countries, as about Mompeller and Narbon in France, and also in Italy, Greece &c. Anguilara says the Third is found growing in Cyprus, and Luddenensis says he found it in France, but formerly differing in the color of the Flower. The first of the Wild Kinds more especiaily grows in our English Gardens.

XIII. The Times. The three Garden Kinds flower in the latter end of July or beginning of August, and the seed is ripe about the end of August or beginning of September. The three Wild forms flower about the end of Summer, and the seed is ripe towards the end of August, or in September, but the leaf of the three flowers and seeds somewhat sooner than the other two forms.

XIV. Note 1. Of these plants the Atracylis or Wild Buffal Saffron, has few or no Virtues ascribed to it by Authours, yet Galen says That it is of a Drying faculty, and moderately digerating. Dioscorides says that if any one is Stung by a Scorpion, he shall feel no pain so long as he holds in his hand, but being laid by, that the pain will immediately return again; Galen says, that it is very good against the poision of all kind of Creatures, and is good for such as are poisoned by eating of Multiforms.
XV. Note 2. Of the Cinnaea, Carthamus, or Garden Kind, the first Species, called peculiarly by the name of Self-flower, is the chief and principal, and that which is only Sold in Shops, and used in Physick, and chiefly Cultivated in all our Fields and Gardens, both in England and beyond Sea, in many other Countries, and of this first Kind it is, that all the Sections of the following Differential relate to. But it is true, that the Second Species, as Alpinus flava, is used by force, in the same manner, and to the same purposes, to purge with, as this first is. Of the Third Species there is little or nothing written by Authors, but by reason of its likeness in form to the first Species or Self-Flower, it is thought to poffefs some of the same Qualities and Virtues.

The Qualities, Specification, Preparations, Virtues, Culture, and Care of Cinnaea, Carthamus or Self-Flower.

XVI. The Qualities. The Flowers are hot and dry in the first Degree, as Mifes writes, Antiperite, After bile, V安防ire, Pectoral, Antirick, Emetic, Cancerous, and Spasmatic-genetic. But the Seed of Self-flower, is hot in the third degree.

XVII. The Specification. Formerly the Seed was only used in Physick, as Galen says. Purgers: Now in our Days the Flowers are used, and to all the same Intentions, besides their Mechanical Application for Drying of Silks, Coloring, Staining, &c. They are said to Cure an Althemia, and all other Difficulties of the Lungs. The Jaundice, Droppy, Gout, Rheumatism, King’s Evil, Impotency in Men, and Barrenness in Women.

XVIII. The Preparation. You may make them, from 1. An Infusion of the Flowers in Chicken stock or Veal Broth. 2. A Tincture of the Flowers in Canary Wine, White Lilac, White Madera, or White Port Wine. 3. An Extract of the Flowers with Spirit of Wine. 4. An Emulsion of the Seed in Meat or Boiled Water, or Chicken Broth. 5. Cinnaea, or a Lobeb of the Seed with Honey, or Boiled Juice of Juniper-Berry, or Camomill. 6. Discarathum. 7. Discarathum novum. 8. Emesis, or the Clyster. 9. A Pouder of the Flowers. 10. A pulp of the Seed.

The Virtues.

XIX. The Infusion of the Flowers in Chicken stock or Veal Broth. A dram of the Flowers in Infusion, opens Obstruptions of the Liver and Spleen, purges the Bowels gently, and are probable against the Yellow Jaundice, Green-Sickets, and other Difficulties proceeding from the Obstruction of the Womb.

XX. The Tincture of the Flowers in Canary Wine, White Lilac, White Madera, or White Port Wine. It has the Virtues of the former Infusion, but much more agreeable to the Stomach and Bowels, and therefore is more probable against the Jaundice: it opens, clears, and purges, but in a more gentle manner than the Tithymalas or Spurges, and 1/2 an Ounce good against Allthemia, Coughs, Colds, and Obstructions of the Lungs.

XXI. The Extract of the Flowers. It may be made with Wine, or Spirit of Wine, Meat, and other things of like nature. It is good against the Droppy, Jaundice, Goat, Scoury, Rheumatism, Kings Evil, Obstruptions of the Womb: Purgers gently, and may be given from a Scruple to two Scruples, or more, according to Age, and other Accidents, and repeated every other Day, for 5 or 6 times together.

XXII. The Emulsion of the Seed in Meat, Boiled Water, or Chicken Broth. It provokes to Purgation, and cures Colicks, and other Difficulties; prevents against the Colick, Allthemia, and shortness of Breaths, as also against the Scoury, Dropsy, Gout, Rheumatism and Kings Evil, Coughs, Cold, and other Difficulties of the Body, and Lungs. But by reason of its harseness it ought to be corrected with Antifeeds, Carraways, Cardamoms, Cloves, Galangal, Ginger, Sal Gum, &c.

XXIII. Cinnaem, Or Lobeb of the Seed made with Honey. Take the Inner Kernel of Cinnea or Carthamus Seed 3 Drams: Almonds blanched: In a little Water, draw a sufficient Quantity, aniseeds, Caraway, Galangal, Ginger, of each in five powder a Scruple: Sal Gum Levigated gr. 1., mix and make a Lobeb. It is good against all the Difficulties for which the Emulsion is given: it takes away Allthemia, Hostilities, Wheezing, and other Difficulties of the Lungs; and causes a clear Voice, besides which it very much encreases Sperm or Seed in both Sexes, and therefore is probable against Impotency in Men, and Barrenness in Women. If it is made with the Honey like Extract of Juniper-Berry, it is very much more powerful to all the purposes and Intensions aforesaid.

XXIV. Discarathum. An Electuary of Carthamus Seeds. Take Carthamus Seeds bleak, Hermodactyl, or Al_EXPECT, of each half an Ounce; White Yarbith in fine Powder 6 Drams; Diaspyrium in fine Powder 3 Drams; White Ginger in Powder 2 Drams; Pure White Sugar 15 Owes, Mannia in Crystal 7 Owes. Honey of Roffes, Alconcrted Sugar Candy, Pulp of preformed Quinces, of each 1 Ounce; mix the Honey, Mannia, and Pulp of Quinces with the Sugar until hot, being boiled to a Confitency, then add the Powder, and make a solid Electuary, to be formed into Tables according to Art. It is an Excellent thing to purge Choler, Purgem, Wind and watry burns from all parts of the Body, but chiefly from the Head and Joints. It is good against the Scoury, Droppy, Jaundice, Gout, Rheumatism, King’s Evil, Pufiee, and an intractable or old head ache: and being made up into Lozenges, it may be given to Children to Kill Worms. Dose from half an Ounce to an Ounce; and in very strong Contiurations to an Ounce and half.

XXV. Discarathum Novum. Take Carthamus Seeds Haxed an Ounce; Diaspyrium, Hermodactyl, Roffes fine half of each half an Ounce; Embosan 3 Drams; Owas, Ginger, Barvires, Winters Cinnamon, Zedbury, of each 1 Drams; all being in fine Powder, mix them with the triple weight of Honey of Roffes sofitive strained, or Syrup of Peach-flowers, and make an Electuary according to Art. It has all the Virtues of the former, but much more powerful to every intention; and may be given in the morning falling, from half an Ounce to an Ounce, to be swallowed alone, or in some convenient Vehicle cold.

XXVI. Emesis, Or the Clyster. Take half Muton or Chicken Broth three quarters of a Pint, of the Emulsion at Silt. 2. above a quarter of a Pint or something better; Sal Gwum in fine Powder half a Dram, mix for a Clyster. He Evacuates the Bowels, and gives relief to the Collick and Ginting of the Guts, cleansing the Bowels from Viti- cious Flagon, and other Acid and sharp burns.

XXVII. The
XXXVII. The Powder of the Flowers. Given to a Dram in Boily Water, or Mead, or Honied Water, it prevails admiringly against the yellow Jaundice.

XXXVIII. The Pulp of the Seed. Given to a Dram in an Ounce of Syrup of Wormwood, it is said to cure the Jaundice, gives ease in the Collick, and kill worms in the Stomach and Bowels.

XXIX. Nota. Some Authors say that the Seeds of Cinarae or Carthamum which are brought to us out of the Levant Countries are more quick in their Cathartic or purging Qualities, and more powerful in their Operation, than those which grow in England, or our more Northern Climates.

As to its Valorous Vertue. It is very manifest in its effects, being used either in its Powder, which may be confidently given inwardly, and outwardly fried upon the Sore; Or, in its Timbrel, given inwardly daily, and waiting the Wound with it; Or, in its Extracto, in like manner given and applied, Or, in its Infuffion in Wine, or White and Water, Or in Syrup, inwardly and outwardly used, by which it acts as a powerful acid particles by which the Wound or Ulcer is kept open, and gently carries off the Recomings of the humours, diverting them another way; and for their very inciting to Admiration acts in Curing Sores and Ulcers of the King's-Evil, being used in the ways above mentioned; or, thus. Take the Sulfon of Peru, a Ounce; Powder or Softflower a Dounce, mix them. Outwardly put it upon the Sore or Ulcer: and inwardly give it from half a Dram, to a Dram or more, according to Age and other Accidents, so long as need requires.

XXXI. The Culture of Soft-flower, or Carthami. What we shall try to this shall be from a Letter of Henry Hall Esq; whose Experience in the management thereof is worth Observation. This flower in my Opinion (says he) is improperly called Soft or Zaff-flower, for its Seed is the same name we call Carthamus, and is Cultivated after this following manner. The ground being prepared and made fine, the Seed is sowed in Hills, as Pease here about London are most usually sowed, but this at a greater distance, that it be not sowed or blown and cleaned from the Weeds; besides it must be sowed very thin; for it is a strong plant, and requires room to spread; one Stalk producing Sevens, Ten, or Twelve Heads of Buttons, all which bear Flowers. The exact quantity of Seed to an Acre (for want of my Notes) I dare not affirm; but to the half of my remembrance, it was about five Pecks to an Acre. After it is come up, about six inches in height, the ground must be well cleaned from Weeds; from which afterwards, for the most part, the plant defends itself but if once riven, they must be carefully weeded out; other looking to it needs not, until the Flower grows ripe, which is known by its color, for then the flower be of a deep Orange.

Tayloe, it flattered here with us in the beginning of August.

XXLXII. The Gathering of the Flowers. Such hands as are cheap got, are made use of in this work, as Women and Children, who with but little spad knives, take out the Flower from the Buttons which they put into Baskets they carry on their left Shoulder, into other great Baskets, in which it is carried home to be cured. The ripelt of the Flowers must not be gathered, the others will ripen fake-
Salmon's Herbal. Lib. I.

CHAP. DCXIV.

OF SAGE GARDEN.

I. THE NAMES. It is called, by the Arabians El-ficoth, and Actificion in Greek El-xicoth (derived I suppose from the Arabick Name:) in Latine Salvia (gives Salvia bonomens et inodorum officin.) and in English, Sage.

II. The Kinds. There are two principal species of Sage, viz. 1. Salvia, major altera, Garden Sage, of which in this Chapter. 2. Salvia, major rubra vulgaris, Wild or Wood Sage, of which in the Chapter following.

III. The Kinds of the Garden Sage. There are many species of this fort, some of which grow not with us, the chief of them which we have in our Gardens are these following, viz. 1. Salvia major altera Vulgaris, Salvia altera bistifolia, our common greater white or Green Leaf'd Sage. 2. Salvia, major rubra vulgaris Salvia rubra angustifolia, our common red Sage. 3. Salvia maximas latifolia, Salvia latifolia ferrata, great white Sage. 4. Salvia Virtutis, Salvia minor Matthioli, Salvia pannata, Salvia minor Gesneri, Salvia angustifolia & cun.jpg

The Descriptions.

IV. The first or our common greater white or Green Leaf'd Sage. It has a long and pretty thick Woody Root, with many Brigs adhering to it, which send forth four square Woody Stalks in some green, and in others a whitish green, as are also the Leaves, which bend by pairs or couples at the joints, being somewhat long and broad Round and wrinkled, of a strong but pleasant aromatic smell: at the tops of the Stalks come forth the Flowers, set at certain spaces, one above another, which are long and gaping, the Flowers of Chary, or Anchial, but of a blish purple color: after which come small Round Seed in the bottom of the bush which contained the Flower. This Plant is more worth propagating by slips, thrust into the Ground in the Spring time, even by the Seed.
V. The Second, or our common red Sage. This in its form, as to its Roots, Stalks, Branches, Leaves, Flowers and Seed little differs from the

Sage Garden Common and Red.

former, facing that in this the Leaves are of a red or purplish color, of the same length but narrower; and it seems to be the more graceful and fragrant Plant of the two. Parkinson thinks, that both the former and this are but one and the same Plant or species, or that they both rise from the same Plant being flip off, and set.

VI. The Third, or great white Sage. This differs not much from the first, or our common white or green Sage before described in the manner of the Growing, as the color of the Leaves, or sweetness of the whole Plant. The chief difference consists 1. in the Leaves, which are much longer and a little dented about the edges, and sometimes much more, making them seem curled, driven of the Leaves being four Inches long, and three Inches broad. 2. in the Flowers, some Plants bearing purple Flowers, like the common Sage, and others white flowers, which is the more rare.

VII. The Fourth or Sage of Virtue. This in its Root, Stalks, and Branches, grows like unto our first or common green Sage, but that the Branches are longer and flimmer, the Leaves also whiter, and never red, and much smaller and narrower, having for the half part at the bottom of each Leaf, on each side, a small piece of a Leaf, which makes it seem like Fennel or Fennel. The Flowers are also of a brownish purple color but differ. There is another of this kind which bears white Flowers, differing in nothing else from the other.

VIII. The Fifth or most odorous or small Sage, or Spanish Sage. This small Sage is in most things like ours the former Sage of Virtue with Ears, so like, that unless it be well bred or considered, it may be thought one with the other; but herein consists the Difference. 1. It seldom grows so great or so large as that. 2. Its Leaves are

somewhat smaller and greener, or not so white. 3. It is more tender to keep, and does not in the Winter, unless it be better defended than the other. 4. Its smell is more sweet, and Pleasant, yet a little quicker withall than the former, which is easily discerned by any that can judge of smells. 5. Lastly, some kinds thereof bear white Flowers, and others blue.

IX. The Sixth, or Wormwood Sage, or Roman Sage. This differs little in the form of growing, or of

Roman Sage

Sage of Virtue.
The Virtues.

XVII. The Green Leaves. They are usually eaten in the Spring as a Salad, with a little Vinegar, Salt, and Pepper, with good Butter and Bread, to eat it strengthens the Stomach, expels Wind, comforts the Bowels, and reliefs Poison, and is profitable for such as are Dull and Drowsie, and apt to be afflicted with Vapours from the Spleen or Worm.

XVIII. The Juice. It stops the Bleeding of Wounds, and cleanseth foul putrid Sores and Ulcers. Agrrippa says, that if it be taken with a little Salt by Childish Women, for some days before they accompany with their Husbands, whose Wombs are too moist and slippery, and are unfruitful by reason of that default, it will help them to conceive, and such as have conceived, and are subject often to military upon any small occasion, it will prevent the Abortion, and cause them the better to retain the fruit in the Womb, and also make it the more livly. Therefore in Opyrus and Egypt, after a great Plague, Women were ordered to drink the Juice of Sage, to cause them to be the more fruitful. And Orpheus says, that three Spoonfuls of the Juice of Sage, sweetned with a little Honey, and taken falling, do prevent the Spitting or Vomiting of Blood. Matthiolas says, that it is very profitable for all manner of Pains of the head coming of Cold, and Rheumatism humors, as also for all pains of the Joints, whether used inwardly or outwardly, and for such as have the Eyes Sore, Leachery, or Gredle Evil, and such as are dull and heavy of spirit, and for those who have the Paline, or are troubled with Dilections of their Rheum upon the Lungs, as also for other Difeases of the Thorax or Breast. Day cori des says that it provoketh Urine, brings down the Coueries, and forces away the dead Child. Phvys says that it provoketh Women to Cowards, and yet that it stops them, when they come down too fi, helps the slings and bittings of Serpents, and kills Worms breeding in the Ears, as also in Peril Sores or Ulcers.

XIX. The Essence. It has all the Virtues of the Juice, and is more potent to all those Intentions, besides which, it is of good use in the Plague it killth, and against all Malign and Pellimental Diseases, being taken Morning and Evening, and at other times as the Physician shall advise, from a Spoonful to 8 Spoonfuls, according to Age and other Accidents, in any proper Vehicle.

XX. The Infusion or Decoction in Wine or Water. They have all the Virtues of the Juice or Essence, but much inferior to them in Potency, and therefore may be given from a Quarter of an Ounce to half a Pint at a Time, as the occasion may require; and may be used Ordinarily, infused in Water, after the manner of Tea, by which many have found very good Effects. Basted upon the Cod it slakes their Thiching.

XXI. The Powder of the Leaves. Taken to a Dram, it rectifies the evil disposition of the Stomach, corrects and expels Wind, is good against Scrofula or Struma, and outwardly applied stops the bleeding of Wounds, and also cleanseth and drys up old Putrid and running Sores or Ulcers. It also stops the immediate Flux of the Coueries, and slays Vomiting.

XXII. The Oil or Ointment. They are Aromatic, or exeters of Pain, diffuses Tumors in their first apparence,
It is highly Cordial and Neurotick, and has all the Virtues of the Jule and Efficjce. Dose half an Ounce or more against Glasses of generous Wine. It comforts and warms the Womb, and promotes Conception.

XXI. The Disdilled Oil. It is Cephalick, Neuronticks, Cardihc, Uterine, Carminative, Antody, Iapdiapharmic, and Analeptick; quickens the Senses and Memory, Strenthenes the Head, Nerves, and Joints, is good against Appelates, Convulsions, Epilepsy, Lethargies, Megrima, Pallies, Venuses, helps against Cataracts, Rheumatism, Pneumotick pains, Coughs, Colds, Spitting of Blood, Confumptions, and painted the Sides; it expels Wind, dries up watry humors, and is good against the Biting of Mad Dogs, Serpents, and other Poisonous Creatures; it provokes Urine wonderfully, brings down the Blood, and balishes the Birth, causing easy Delivery, and in a word has all the Virtues of the Jule, Efficjce, and Spirit aforgoing. Dose a gutt iii, ad x, in some convenient Vehicle. It must never be given alone, because of its exceeding heat.

XXII. The Poisjice or Powers. These have all the Virtues of the Jule, Efficjce, and Diffbilled Oil, and may be given to all those Cases of pains and Intentions, twice a day, in a Glass of Gentle Wine, from a quarter of a Spoonful to half a Spoonful. They facilitate the Birth and After-Birth, Fisce away the Dead Child, and presently refit a Paralyjce.

XXIII. The Etixir. This is yet stronger than the Powers, and of more exalted properties, but may be given in the same Dose with them, and after the same manner.

C H A P. DCXV.

OF SAGE WILD.

I. T H E Names. It is called in Greek Σαλβια or in Latin Salvia Sylvestris: and in English, Wild Sage.

II. The Beeds. We shall Treat but of three Species in this Chapter, viz.

erum Cephalini, Storium altorum quisquefam Analagia quisquefam; Wood Sage, Wild Sage or Gartick Sage.

2. Salvia futesifis, Salvia fruticifis futesifis, Yellow wild Sage with Broad Leaves, called by some Sal French Sage. Anguiular, Cofis, Daceotes, Clafis, and others do call it, Verfifum Syfylis, and Verfifum quarenter Matthiul, ma
ing it a Species of the Aludinis, but it is certain, it is not a kin to them; for tho the Leaves are Wooler like Aludinis, yet their form and shpe, with the Flowers and other Circumstances there it to be a kind of Sage, and in it it is not England, France, and Italy, viz. Wild Sage.

The Description.

III. The Thift, or Wood Sage, or Garlick Sage. Its Root is long and Stringy, with many Fibres adjoining, being many years. It rises up with Square Hoary Stalks, two feet high at least, having two Leaves set at every Joint thereof, which are somewhat like unto Sage Leaves, but smaller, fatter, whiter, and rounder, a little dented about the edges, and smell somewhat strongly. At the top of the Stalks and Branches grow Flowers on a slender long Spike, turning therefore all one side when they blow, and are of a Pale or Whitish Color, smaller than Sage, but lasted, and going like to them. The Seed is blackish and round, four or six together in a husk.

IV. Gerard describes it thus. Its Root is full of Strings, from whence spring up Stalks a square, somewhat hairy, upon which are set Leaves like those of Sage, but fatter, broader, and fferer. The Flowers grow up all upon one side of the Stalk, open and forked like those of Dead Nettle, but lefter, of a Pale White Color; after which come the Seeds, four together in one husk. It is a plant which lives but a year, and grows of Garlick when it is bruised, being thought to be a kind of Garlick Germainer, as it in Garlick smells strongly.

V. The Second, or Yellow Wild Sage with Broad Leaves, called by some French Sage. Its Root is Woody with divers Strings and Fibres adjoining to it. It has several Square Woody hoary Stalks, on which grow at several places, rugged, hoary

Sage Wild Yellow Broad Leav'd.

broad, and almost round pointed leaves, many set together, very like unto the great Sage, but larger. The Flowers grow likewise, in bundles or Spaces towards the Tops of the Stalks, very like else unto the Flowers of Sage, or Archangel, but of a Yellow color. The Seed is greater than of any sage, somehow brownish, and round like the mead or thistle kind following. The whole Plant smells somewhat strongly and heably.

VI. Gerard describes this second kind thus. Its Root is thick, tough, and of a Woody substance, as is all the root of the Plant. It grows up like a small Woody Shrub, having many Woody Branches, of a Woody and Hoary color, soft and downy: On which are placed thick hoary Leaves, of a strong Pontick Smell, in shape like to the Leaves of Sage, whereupon the Vulgar People call it French Sage. Towards the Tops of the Branches are placed Roundles or Crowns of Yellow gaping Flowers, like those of Dead Nettle, but much greater.

VII. The third or so great Yellow Wild Sage with narrow Leaves. Its Root is blackish and Woody. This Species has very many hoary and woody Leaves, the lower in elder, more than the upper, longer and narrower else, than those of the Small Sage, from among which rise up Square hoary and hoary Stalks, about a foot high, on which do grow much like long hoary Leaves as grow below, two always set together, as the Joints, one against another, where the Flowers grow at spaces, about the Tops of the Stalks, with two Leaves under them, broad at the bottom, and encompassing the Stalks, being shorter than the rest. The Flowers are large, open and gaping, like unto Sage, or somewhat more like to those of the Dead Nettle or Archangel, of a Yellow color, and coming forth out of hoary, woody Husks, covered with pale colored Hairs, the Tops by reason of their length and width, bend-
The Virtue.

XIII. The Juice. It is good against Ruptures or Burthenists, Contusions, and Wounds. It is good also for moist Ulcers and Sores in the Lepp or breast, to make them safe and dry them, and cause them speedy to heal.

XIV. The Essence. It has all the former Virtues, besides which being used daily mixed with a proper Vehicle or otherwise Decoction it has been found successful in curing the French Pox, being mixt with a Decoction of Guassaeme, and being taken for 20 or 30 days together, it cures Scrofula, Dryness, Ulcers, Hepatitis, and difeases in the Liver, Stomach, bowels, and joints. It makes the parts safe, gives ease in the Strangury, provokes Urine, and fafely expels the Birth. Dose 3 or 4 spoonfuls in a Glass of Wine, or other proper Vehicle.

XV. The Decoction. Made whether in Water or Wine, (but the latter is more effectual) it has all the Virtues of the Juice and Essence; but must be given in much a greater quantity, as to half a Pint two or three times a Day. Gerard says it is given to such as have had a Fall, and are inwardly bruited, and also provokes Urine. And that the Decoction is given to drink with good success such as are infected with the French Pox, for that it caueth Sweate, dryes up Ulcers,
OF SAMPIRE, OR, SEA-FENNEL.

I. T'he Name. It is called in Greek 
Salmon's Herbal. Lib. I.

The Plant, or Common Rock Sampire, is, in English, Sampire. 

Sampire, and in Latin, Critbumum morium : in English, Sampire. 

Criticalum morium, for, that he saith, that this has White and 
Broader Leaves than Purslane, whereas this has 

Salmon. Grith-

small, long, and narrow Leaves, and that the 

The Critbumum is rather Porportus 
morium, and that this our Sampire ought rather 

to be called Fenneculum Marinum, for as much 

as not only the form of the Leaf, but the Umbles 

and Heads of Flowers, and the whole face thereof does assimilate a Fennel-like form. Petrus Cretensii calls it Critbumum & Ritemum 

Marium.

II. The Kinds. There are five kinds of 
Sampire, viz. Critbumum morium vulgaris, Critbumum morium umbile maris Bauhini, Batysca alterum genus ex Sicilia Cefalpini ; and 

is thought to be that which Pliny calls Baty, as Geynora in Hortus doce, who also calls it 

Critbumum morium. The Italians call it Herba 
de San Petro, and some from hence Sampetre, whence comes our English word Sampire. This 

first kind is doubtless Our Common Rock Sampire. 

Critbumum morium major, Critbumum fine 

Fenneculum marinum mortar vasbumb, The greater 

Rock Sampire. ; Critbumum morium, Critbumum 
tertiurn Matthioli, Mat or Sea Sampire of 

Matthioli. 4. Critbumum minorum spinifum, 

Dulcini, Pelfitia Marina Lobelli, Lensdenfis, 

alteramque ; Angulus took it to be Seracul, 

and Camerarius calls it Cahry marins, and 

Bauhini thinks it is the Tribulus maximus 

Quadrandus of Dolchenviaris, Thorny Sampire, or 

Sea Parthen. 5. Critbumum Chrysanthemum Dodo-
net, Crysanthea intemor Lobelii, Antyliis 

primus Dipororbus Cefalpini, Antyliis major Cordi, 

Critbumum morium, Albus After Attici Bussihi, & 

After attici maximus of some others, Golden 

flowered Sampire.

The Descriptions.

III. The Fifth, Our our common Rock Sampire, 

has a Root which is Great, White, and Long, 

of a hot spicy Tafe, enduring long, and continuing 

many years. It grows up with a Tender green 

Stalk, about half a yard, or two feet high at most, 

branching forth almost from the bottom, and flared 

with several Thick, somewhat long, and almost 

round Leaves, of a deep green color, sometimes 

two and sometimes three together, and sometimes 
some or five or more on a Stalk, which are flaky 
or feppy, and of a pleasant but or spicy Tafe. 

At the top of the Stalk and Branches come 

forth Umbles of White Flowers, and after them 
come large Seeds bigger than Purslane, and some- 

what like to that Seed.

IV. The Second, Or Greuter Rock Sampire. 

This plant in its Root, Stalk, Branching forth,
Chap. 616. English Herbs.

Sampire Golden Flower'd.

The Sampire, or Thorny Sampire, or Sea Sampire. Its Root is long and white, somewhat like unto a Parsnip, but more divided into parts.

Shrubby or Woody kind of Substant, having many Stalks rising up from one Root, which are straight or upright, yet a little inclining towards their Tops, all which are replenished with many Leaves set round about them, by spaces or distances as it were Glasses, many Leaves rising together from one Stock or Evisick which are a little long, and thick of substance, having a Palfish Yafe. Underneath the springsing forth of these Leaves, come forth other single Leaves of nearly twice the length of the other. The Flowers grow at the Tops of the Stalks, and are round, and hairy or downy, and of a pale whitish red Color.

VI. The fourth, or Thorny Sampire, or Sea Partickp. Its Root is long and white, somewhat like unto a Parsnip, but more divided into parts, and it is of a good relish, somewhat resembling that of a Parsnip. This is very like the two first kinds of Sampire, but it grows greater and higher, with shorter and narrower Leaves, much more divided, and sharp and prickling at the ends. The Stalks more fappy, and of a fuperior green color, breaking into 3 or 4 Branches, towards the Tops where grow large Umbels of white Flowers, and afterwards Fennel like Seed in prickly Hacks.

VII. The fifth, or Golden Flower'd Sampire. Its Root is pretty thick, divided into several Branches, having many Strings adjoining thereto. It rises up with several hard round Stalks, very thickly covered or replenished with very narrow, long, and somewhat thick Leaves cut in at the ends. At the Tops of the Stalks hang single Flowers like unto Alter, or Chrysanthemum, wholly Yellow, both

the Border and the Thrush in the middle, in which lies the Seed when they are ripe, and are blown away with the Wind.

VIII. The Places. The first and second grow uppon Rocks and Cliffs near the Sea; The third, Aegitum in littore Maris, locis plantis, non clime: grows not on Rocks and Cliffs as the former two do, but upon the Sea shore, on plain Ground. The first and second grow on the Rocky Cliffs at Dover, Wintefeld by Rie, about Southampton, the Isle of Wight and Poole, and most Rocks about the Weft and North parts of England; more especially on such Rocks, as are often moistened at the heel, if not overthrown with the Sea Water. The third, fourth and fifth in other grounds not far from the Shore; The fourth or Thorny kind, grows upon the Sands and Beaches, between Whiftable and the Isle of Wight by Sandwich, and by the Sea near Wijt Clifte. The Fifth and Eift grows in the Muddy Marsh in the Isle of Slopey, going from King's Ferry to Shetland-Boats.

IX. The Times. Rock Sampire is said to Flower in May, June, and July, and must be gathered to be kept in Pickle in the beginning of August, as the others Flower in July, and their Seed is ripe in August.

X. The Qualities. Sampire is hot and dry in the end of the first degree; Ablative, Aperitive, Digestive, Diuretic, Stomachick, Splenick, Nephritic, Hydrick, Emmenagogue, Analeptic, and Spermatogenetick.

XI. The Specification. It is used to provoke Urine, give safety to the Stomach, open obstruction of the Vessels, chiefly of the Spleen and Womb, and provoke
Salmon's Herbal. Lib. I.

The Virtues.

XIII. The Juice or Essence. They provoke Urine and the Fluxes, are helpful against the Yellow Jaundice, open obstructions of the Stomach, Liver, Spleen, Melancholy, Relins and Worms; and to remove those obstructions which afflict those parts. They are profitable against the Strangury, and carry off any Tartarous material which afflicts the Urinantes. Dofe 2 or 3 Spoonfuls in a Glass of White Port or Lisbon Wine morning and night.

XIV. The Decotion in Wine. The Roots, Stalks, and Leaves boiled in Wine and Drunk, provokes Urine, removes the difficulty of taking Water, and is good against the Jaundice. It has an excellent property to open, cleanse and dry: It helps Digestion, clears the Urinary parts from Stones, Gravel, Sand, and Slime; and, is good against Hypochondrial Melancholy, and has all the Virtues of the Juice and Essence. Dofe half a pint morning and night.

XV. The Pistle or Sallet. It is a very pleasant thing both to the Palate and Stomach, helps Digestion, opens Obstructions of the Viscera, provoking Urine and cleansing those Vessels of all Heterogeneous matters obstructing them. It strengthens the Stomach, provokes Appetite, and is a most excellent and familiar Strew, of extraordinary advantage and most agreeable to the Bodies of Human Kind.

C H A P. DC XVII.

O F S A N I C L E,

O R, H E A L - W O R T.

I. T H E Names. We do not find that this Plant, or any of its Species were ever known to the Ancient Greeks or Latins, and therefore no Names can be derived from those Mountains, but our Modern Authors have called it in Latin, Saniculo (præter sanandi munere) and by some Saniculo mar, because those make the Alptrum nigra Dioscoridis, or the Heliorbus nigra Saniculo folis major, to be Saniculo femina. It is the Diapeniga Braunfeli, Gerardi, Lobelii & Matthioli; Sideritis tereis Dioscoridis Odemundi, Cystifera quinquefolia Tubmerentanti, Quinquefolia albertum Matthioli, in English Sanicle, Heathwort, and Self-bow by some.

II. T H E Kinds. Before the Saniculo major or Alptrumus, of Great Value, commonly called Ladies Manto, of which we have treated already in Chap. 431 foregoing, we have these following Species of this Plant, viz. 1. Saniculo, Saniculo Vulgaris, Diapeniga Gerardi, Our Common Sanicle. 2. Saniculo Guttata, Saniculo Montana utero Chaffy, Saniculo Alpina, & Guttata Camerarv albo-tumuc, Saniculo Cardophylla, fice, Gem Alphum recentiorum folio Lobelif; Sclerotic Sanicle and London Pride. 3. Saniculo Alpina, Saniculus Corousa

(color, and sometimes reddish about the brims; from among which rise up small round green Stalks, without any joints or Leaf thereon, sitting at the Top, where it branches out into Flowers, having a Leaf divided into three parts, at the bottom, with the Flowers, which are small and white, standing out of small round greenish yellow Heads, many standing together in a Tias, in which afterwards the Seeds are produced, the East round, rough Barres, something like unto the Seeds of

Sanicle Common.)
Rather than Roots, much interwoven one among
another. The Leaves which spring up first are
much Crumpled, and as it were folded to
ermors, open themselves into fair
and roundish Leaves, sometimes rough, or
airy, not only cut into fine pieces, but some-
what Nitted or divided off about the edges, of
a dark green color, on the underfide, and more
White, beneath underneath, from among the
Leaves, raises up one naked round Stalk, and
sometimes, two or more, five or six inches
high, bearing at the top several small Flowers, some-
what fuscous, like unto the purple Bears ear,
banging down their heads, consisting of five fucate
pointed Leaves spaces, of a dark reddish pur-
pel color, with a White Circle or bottom in the
middle, and some small threads therein. After
the Flowers are poff, there come small round
heads, somewhat longer than any of the Bears
ears, standing upright upon their small Stalks,
in which is contained fomond round and Blackish
Seed. The Leaves of this plant dye down every
year, and springing up anew in the beginning of
the Tear following, whereas the Bears ears, hold
their Leaves Green all the Winter, flowering like
a clofe head, the outerfift only purifying after
Seed time.

VIII. The Fourth or Shrubby Sainicle of Ame-
rica. This has feveral almost round Leaves lying
upon the Ground, each upon a little long
footstalk, divided at the edges into two ports,
drawn likewise about the bodies. From among
which rise up hard fpondy Stalks, near two feet
high, having fuch like Leaves hereon, as grow
below, and branching forth with feveral small
white, Starfike Flowers in a tuft together at the
Top.

IX. Gerard defcribes the Bears Ear Sainicle this.
The Leaves fpring forth in the beginning of the Spring,
very thick and fat, and are like a Purfe or
round Lump at their fbrt coming forth, and when
it is spread abroad, the upper part thereof is
full of Veins or Sinuets, and below or carned
like the Crumpling of a Cobweb. Leaf, and are
not only interwoven about the edges, but each Leaf
is divided into six or more Jaggs or Cut-deeply hocks,
greenfhit above, and of an over worn green colour
beneath, and hot in Touch. From the middle
underfoft, fprings forth a bare or naked Scalac
inches long, fourfomad purple in color, bearing at
the Top, a Tuf of small bollos flowers, looking
or hanging downwards, like little Bellis, not unlike
in form to the common Coupolds, but of a
fine deep red color teading to Purple, looking
in the middle a certain Circle of White, and al-
fo certain points or Stripes, which turn into
an Head, in which it contains the Seed. The
whole Plant is covered as it were with a rough
Woolfins. The root is Frubs and Thesly.

X. The Plants. the first or Common Sainicle
grows in shady Woods and Coplae almost every
where, and delights in a far fruitful and moist
Soil. The second grows in shady Woods on the
Alps in several places, but with us in Gardens
in many places, where they Thrive very well, but
delight more in the Thales than the Sun. The third
grows alfo in many shady Woods both in Italy
and Germany, Anfria and Stiria, but with us in
Gardens. The fourth was brought to us from
the back parts of Virginia called Canada.

XI. The Times. the fluit Flowers in May and
June, and the Seed is ripe, in July or August.
The Leaves of the Herb are grown all the Year,
and are not hurt with the cold of Winter.
Salmon's Herbal. Lib. I.

The Second Sorts Flower in May and continue flowering until June, and the Seed ripens soon after, the Roots abide all the Winter with little Leaves on them, springing afloat in the beginning of the year. The Third Flowers in April and May, and sometimes in June, and the Seed ripens in the mean Season. The Fourth Flowers in July, and its Seed is ripe in August.

XII. The Qualities. Sallows is hot and dry in the second degree, Gallitious, Astringent, Index, and Vertebral.

XIII. The Specifications. It is a speedy healer of all sorts of Green Wounds, Cleanses Apoplexy and foul Ulcers, helps Tumors in the Body, repeples humors and dissipates them. It is good against Spriting Blood, and the Bloody Flux. Ulcers of the Reins or Bladder, and stops the overflowing of the Terms in Women.

The Virtues.

XV. The Juice. It is exceeding good for the speedy healing of all sorts of Green Wounds, and any Apoplexy, Ulcers, or Bleeding inwardly; it cleanses the Sore or Ulcer, and induces the healing by its affränkyness, being inwardly taken and outwardly applied, for it repeples a Flux of Humors to the part, and diffuses the Tumor thereof.

XVI. The Essence. It has all the former Virtues excited; besides which it heals any Wound or Ulcer of the Lungs, or other Vipers, cures the Flux and Bloody Flux, as also Spriting, Vomiting and Pilling of Blood, Ulcers in the Reins and Bladder; gives ease in the Belly-ach, and stops the overflowing of the Terms in Women, and is profitable for such as are troubled with any Rupture or Skinfulness.

XVII. The Decoction in Wine or Water. It has all the Virtues of the Juice and Essence but much weaker, and therefore must be given in a larger proportion, as from a quarter of a pint to half a pint. It gives present help when the distemper falls upon the Lungs or Throat, and cleanses and heals all manner of purrit, flincking and Malign Ulcers of the Mouth, Throat, and private parts, by gargling and washing with a Decoction made of the Leaves and Roots, in Wine or Water, and Sweetened with a little Honey. It is profitable also against a Virulent Gonorrhoea or running of the Reins, being drank Morning and Night after due cleansing.

XVIII. The Powder of the Leaves and Root. It has the Virtues of the Juice and Essence, and being breathed upon old purrit Sores and Ulcers, it cleanses, dries and heals them.

XIX. The Catalepsy of the same. It diffolves and dissipates cold Tumors or Swellings, is Anodyne, and gives ease in a recent Gout.

XX. Note. In short, Sallows is as effectual in obliterating, relashing, busting, drying, confusing and healing as Bogue, Comfrey, Self Heal, or any other of the Confounds or Vertebral Herbs whatsoever, and is used in Vertebral Diets and Wound Drinks, for the healing of all inward and outward Wounds and Ulcers.
Chap. 618. English Herbs. 1907

Long, and thick, resembling the Roots of Liliun non bullarum, or Daup Lilly. It perishes after Seed time, but is eaten, as divers other Roots are, for Salattis, for London, and many other Countries besides. The Leaves are broad below, and pointed at the end, flipte about the Edges, and of a dark green color. The Stalks are round and hard, two feet high, or higher, divided into many Branches, flipte with the like Leaves, but smaller, the Tops of the Branches are bofte with many purplifh Flowers, like unto Dames Violets or Stock Gilflower, but larger, being not of great Smell. After the Flowers are paff, there come in their places, round, flat, thin Cods, of a dark color on the outfaide, but having a thin middle Skin, which is white and clear, fhining that autuine white Satin. It is flipte, alfo

IV. Gerard thus describes it. Its Root is compofed of many Tubers, like Key Clogs, or like the great Alphodel. It has hard and round Stalks, dividing themfelves into many other small Branches, bofte with Leaves like to thofe of Dames Violets, or Queens Gilflowers, femifluius bread and flipte about the Edges, and is covered almoft like Sawce alone or Jack by the Hedg, but that they are longer, and fharpier pointed. The Stalks are charged or loaded with many Flowers, like the common Stock Gilflower of a purple color: which being fallen, the Cod comes forth, contained in a flat thin Cod, with a fharp point or prickle at one end, in flipte of the Moon, but inriuous blackdire. This Cod is compofed of three films or Shains, of which the two outiftall, are of an ever worn affof color, and the innermost in the middle, on which the Seed does hang or cleave, is thin, and fharp, liking like a piece of white Satin. The whole Plant dies the fame Year that it has born Seed, and must be fown yearly.

V. The second, or long living, or Long Codded Sartin Flower. Its Root is compofed of many long fliptings, which die not as the former, but abide all Winter, and flipt out new Stalks every Spring. This has broader and longer Leaves than the former, the Stalks are greener and higher, branching out into Flowers, of a pale purple color, almoft upright, confiiling of four Leaves in like manner, and fhining pretty flipte, bearing flipte like Pods, but longer and fharpier then they.

VI. Gerard thus defcribes this second Species. Its Root is thick, whereunto are flipted an infinite number of long thready fliptings, which Root dies not every Year as the other do, but multiplies it felf as well by falling of the Seed, as by new fliptings of the Root. It has many great and broad Leaves, almoft like thofe of the Great Bark-Dock. From among which rife up a very tall Stem or Stalk about four Cushes high, stiff, and of a white green color, flipte with like Leaves but smaller. The Flowers grow upon the fiender Branches of a purplifh color, compofed of four fmall Leaves, like thofe of the Stock Gilflower. After which come thin long Cods of the fame fubftance and color with the former.

VII. The third, or Red Sartin Flower, which some foliollily call the Red or French Foppy Suckle. Its Root perifhes the fame Year it bears Seed, for often times at Flowers not the fiwr Year it is Sown. This Red Sartin Flower (which fome call a Red Howard’s Vitheling) has many Stalks of Winged fair green Leaves, many of them flipt on both fides of a middle Rib, whereas that at the End is the largest Leaf. From the Joints where the Leaves fall off, there come forth very long fmall Stalks, bearing on them very many Flowers, up to the Top, one of

have another, of an excellent fhining red or Grenson Color, very like to Satan of that Color, and sometimes of a white or withift Color, which are larger, and almoft eddied together, almoft flat, and not open, not much unlike the Redlock. After the Flowers are paff, rough, flat, round Leaves come forth, looking like unto the old flaffis, or Buckeb, without Ikes, three or fome fhining upon one another, in which are contained fmall fhining Seed.

VIII. The Places. The flift is frequenl in Our Gardens, and is found Wild in fome places of England at Gerard Iays, or in the Woods about Pinner and Harrowon the hill, and in Essex like-

ware about Hope Church. The flift is not fo common in Gardens, but grows about Wafford, fifteen Miles from London. The third is generally Sown in Gardens for an Ornament to the fame.

IX. The Time. The two flift fower in April or May, and sometimes more early. Gerard Eys they fower in April the next Year after they are Sown. The third flowers in June and July, and its Seed is ripe foon after.

X. The Qualities. The Seeds of the flift and flift are hot and dry in the end of the Year, or beginning of the third degree, of a sharp and fhining Tafe, as are alfo the Roots: and are flipt to have the Qualities and Nature of Trench Mulftard, being eaten in Sulfets, as other like things are.

XI. The Specifcafion. White Satin Flower is flipt to Cure the Falling Sulfets and heal green Wounds.

The Virtues.

XIII. The Salatt of the Root. It is made of the young Roots before they run up to Flower, and is eaten at Rumplons with Oil and Vinegar.

XIV. The Powder of the Seed. It is given to a Dram or more at a time, mixed with Honey, or some other convenient Vehicle, Meeting and Inve-

ring, for the Cure of the EpilepBy or Falling Sulfet-

XV. The Ointment of the Leaves. It is made of the Leaves of our common white Satin Flower, and Leaves of Sulfet, of each a like quantity flipted together, which is boiled in Oil Olive to Crufleets, then drained out and repeated 5 times, and afterwards a fufficient quantity of Wax to be added to it to the confiftency of an Ointment. It is a fingular thing for the Curing of Green Wounds.

CHAP DCXIX.

Of SATYRION.

I. THE Names. It is called in Greek σατυρίον, in Latin, Satyrion, and in English, Satyrion, it having yet obtained no other Name.

II. The Kinds. Geoffrey flift, and after him Ca-

varius, Chelus, Lebell, Parkefohn, Gerard, and many others refer this Plant the Satyrion Discoc-

idos, to the Tulips or Tulip, (of which we shall here-
Salmon's Herbal. Lib. 1.

Satyrium Triphyllum verum.

have been made of its Root, it appears to have the fine Virtues with the True Satyrium, which the Tulip is supposed by our Modern Authors to have. This Description here given does do lively credit forth this Plant, that we need not any longer to be in doubt, that our Tulip is the true Satyrium Triphyllum Dioscorides; and that our red Flower'd Tulip may very well agree with his Salvia Tripollina, or Satyrium Erg.,

II. To the Question whether the Name in the Greek Text, putting 

The Difficulties which are made against this Opinion is from the description of the Seed; For the Seed of the Tulip is very like unto the Seed of Lily's, as may easily be seen by comparing them, as being flat, hard, and flimsy; Whereas Dioscorides says, the Seed of his Satyrium is like to Flax or Linseed: it is true as to the hard and flinty properties, tho' not to its form, magnitude, and color, they being more like to that of the Lily. But it is not impossible but that there may be a mistake in the Orthography or true writing of the Name in the Greek Text, putting

III. Then as to the Species of Tulips, tho' the whole Progeny of them may be accounted as so many Kinds of Satyrium, yet Modern Au-
but more especially because the top is plentifully stored with a yellowish Sise like Woolfing, the anfle like
wife, or Skin of it, as it is of a brighter or paler Red, not so eafily to be peeled away, and runs under ground
both domeinbght and foliowey (especially in Country
Ground and Air, where it emerges abundantly,
though not fo m our London Air and fore's grounds.)
It is something like to the yellow Boemoth Tulip
next following. It fhoos out of the Ground, with
broad and long Leaves, like the Cafia Satyrion or
Tulip, at Sect. 11. folowinb, but neither fo broad
nor fo White or Acenly a Green color as it, but
more dark than the late flowering Tulips, fo
that this may eafily be diftinguished by its leaf from
any other Tulip above ground, by fuch as are shi-
ful in them. It bears therefor 3 or 4 Leaves up-
on the stalk like the Cafia Satyrion, and a Flower
also at the top, of the fame colour, but not that
the Leaves herfe are always long, and fomewhat nar-
row, being a large black bottom, made like unto
a Citron, the point of which rises up unto the
middle of the Leaff, higher than in any other Tulip.
The flower is of a pale red color, nothing fo fire-
ly as in the early or late Red Tulips, yet fooner
for the moft part than any of them, and nearest
unto the yellow Boemoth Tulip next following,
which is much of the fame fcale.

V. The Second, or Yellow Boemoth Satyrion
or Tulip. The Root of this may be known from
the former, (or any other Tulip,) in that it fal-
dom grows to fuch a largeness, and is not fo
waxy at the top, and the skin either outside is
fomewhat pater, harder, and sharper pointed, but the
bottom is like the former Red, and not that
the Leaff either are always long, and fomewhat nar-
rower, or White or Acenly a Green color as it, but
more dark than the late flowering Tulips, fo
that this may eafily be diftinguished by its leaf from
any other Tulip above ground, by fuch as are shi-
ful in them. It bears therefor 3 or 4 Leaves up-
on the stalk like the Cafia Satyrion, and a Flower
also at the top, of the fame colour, but not that
the Leaves herfe are always long, and fomewhat nar-
rower, being a large black bottom, made like unto
a Citron, the point of which rises up unto the
middle of the Leaff, higher than in any other Tulip.
The flower is of a pale red color, nothing fo fire-
ly as in the early or late Red Tulips, yet fooner
for the moft part than any of them, and nearest
unto the yellow Boemoth Tulip next following,
which is much of the fame fcale.

VII. The Fourth, or Italian Satyrion or Tulip.
This is alfo of the fame Kindred unto the
three-fold defcrib'd, nor is there any other dif-
ference from them, than that the flowers in this
has none red Veins running in the Leaffs thereof.
IX. The Sixth, or White or fame Colored Satyrion
or Tulip. The Stalk of this is longer than of other
Dwarfs, its Leaffs are narrower than tho' of the
White Tulips, its flower is also larger, and of a
White Colour.

X. TheSeventh, or fmall pafly colored Satyrion
or Tulip. This is one of theformer Species,
and was brought to us out of Italy. Its
Leaffs are small, long and narrow, of a dark green
color, something like unto the Leaffs of the
Boemoth Tulip, the flower is also small, con-
ing of six Leaffs, as all other Tulips do three of which
are wholly of a Red Colour, and the other three
nearly of a Yellow.

XI. The Eighth, or Satyrion or Tulip of Caffa.
Its Root is like unto others of this kind, fo that
they cannot be diftinguished: It is an early Tulip, yet
differ from other early Tulips: It is white, but
Leaffs are as broad and large as they, and fometh-
times crumpled or waved about the edges: in fome
the edges of the fold Leaffs only are of a whitiffi
or whitefith yellow color for a good breadth; but in
others the Leaffs are lifted or parted with whi-
fffith yellow and green. The Stalk rides not up fo
high as the other early Tulips, but bears at the top,
the flower like unto them, in fome of a reddiffh or
whitefith color, with a fuffet colored ground or bottom,
and in others of feveral colors: the Seed is alfo
like unto the early flowering Tulips, Of this Caffa
Species there are both Procecees and Sortimies, ear-
ly flowering and late flowering which the Diligent
Florist may eafily observe.

XII. The Ninth, or Rood or fame Colored Satyrion
or Bergomio Tulip, greater and leffer. These are
a Species of the fifth Kind, or greater Red Satyrion
or Babolion Tulip, and are called by this Name,
because they were found about Bergomio, of which
the one Species is the bigger, the other Species the
6 N
**The Virtues.**

XXII. The prepared Roots. They are done by baking in a Pan or Pot in an Oven, covered over with Peat, or by boiling or stewing over the fire. When baked or boiled soft, the pulp is eaten with Milk or Cream, or with Pepper, Salt and Sweet Butter, adding a little Vinegar, or Wine, as is most agreeable to the Palate. It nourishes much, refines in Consumptions, encreases Seed in both Sexes, excites Luits, and is good against Barrenness.

XXIII. The Juice or Essence. It has all the former Virtues, but more effecutive; being drank 3 or 4 Spoonfuls at a time, morning and night, in a Glass of strong Canary Wine, it is said to be good against Consumptions in the Neck.

XXIV. Sanguis. Or the Blood of Satyrion. It is made as that of Confitry, Parfeps, Potatoes, &c. It has the Virtues and Excellencies of the Pulp, Juice or Essence, abating, but more excellent than them all; for it refines weak and decayed nature admirably, both within and without, provokes to Vanitory Acts, and mightily refreshes the Spirits. Dose one Ounce or more, morning, noon, and night, in a Glass of Canary, or other Spirituous and Generous Wine.

| XIV. | The Eleventh, or Perenn Satyrion or Tulip. Its Root is but small, covered with a thick hard blackish fluff or skin, with a yellowish Wolflony leaf at the top, and under the shell. The Roots also for the most part (in our Climate) grow always left and left, decaying every year, and so perish for the most part, by reason of our Frosts and Cold, although we have many times for them deep in the earth to defend them, but are apt of their own accord to run deep into the Ground: nor are they so apt in parting or setting off buds or little Roots, as the Solomon's or Donof yellow Tulips are; nor do they ever grow or abide so great, as when they are brought unto us from abroad, and seldom flower with us after the fifth year. It rises out of the Ground at the first, with one very long and small round Leaf, which when it is 5 or 4 Inches high, doth open itself, and from forth another small Leaf (as long almoat as the former) breaking out of the one side thereof, and after it a third, and sometimes a fourth and a fifth, but each shorter than other, which afterwards he the breadth of the Donof yellow Satyrion or Tulip or something broader, but much longer than other, and standing more hollow, and of the color of the early Tulips on the inside. The Stalk rises up a foot and a half high sometimes, bearing one Flower thereon, composed of six long and pointed Leaves, of the form of other small Tulips, but not flowering much bigger, than the yellow Italian Tulip, and is wholly white both inside and outside of all the Leaves, except the three outermost, which have on their backs from the middle towards the edges, a tow of a brownish bluss, or pale red color, yet deeper in the midst, the edges remaining wholly white. The bottoms of all these leaves are of a Dark or Tan Tooth Color. And the Chives and Tips of a Darkish Purple or Tympus also. This does seldom bore Seed with us in England, but when it does, it is small like to the Seed of the Solomon's, or Donof yellow Tulips, sometimes.

| XV. | The Twelfth, or Satyrion or Tulip of Candy. Its Root is small and somewhat like to the Root of the Donof Yellow Satyrion or Tulip, but a little larger. This plant has come later to our Knowledge than the Vesuvian left described, and does more difficulty thrive, with respect to our Cold Climate. It has few broad leaves, resembling the Leaves of a Lily, of a greenish color, and not very whorled. The Stalk bears at its top one Flower, larger and more open than many others, which is either wholly White, or of a deep red color, or else in various mixed. White with a fine Blackish Purple, the bottoms being yellow, with Purplish Chives, tipped Blackish Peduncles.

| XVI. | The Thirteenth, or Satyrion or Tulip of Armonia. Its Root is not much bigger than the above, and somewhat like to the Solomon's or Donof yellow Tulip, as before described. It is a small Satyrion or Tulip much differing from all the former (except the small or Donof White one before described) in that it bears 5 or 6 small, long, and somewhat narrow green Leaves, altogether at one joint or place. The Stalk is not high, and is naked or without Leaves, from them to the Top, where it bears one small Flower, like unto an ordinary Red Tulip, but something more Yellow, tending to an Orange color, such a black bottom.

| XVII. | The Titles. The Titles shew from whence many of them came, but now they are all of them Nurnf up in our Gardens, where they thrive and flourish very well.

| XVIII. | The Names. These are all of them Precious, or only Flowers, and Flower in those times and Months with the other sorts of early Tulips: They Flower from the beginning of March (if the Season is Warm or Temperate) and continue Flowering to the end of April, the Seed being ripe in about a Month after the time of Flowersing.

| XIX. | The Qualities. Satyrion is Temperate in respect to heat or cold, moisture or dryness, more inclining to the Dryness, than to the Rest; it is Digestive, Relaxive, Pectoral, Hepatic, Chylifick, Anthelmintick, and Spermagenetic...
Chap. 620. English Herbs.

Savine bearing Berries.

The Description.

I. The Name. It is called in Arabic, Albania. In Greek, Alabah. In Latin, Sabina, and of the same Surname, in English, Sabine, and is a Shrubby kind of Plant.

III. The first. Our Common Savine, has a long, Branched out, woody Bough, from which springs up a small bow Bough or Shrubby Plant, three or four Feet high: having a Woody Scent, with many woody Branches on it, crooked or bending; on which are set many small, short, hard, thicke, and prickely Leaves of a dark green color, which are fresh and green both Winter and Summer. The Leaves are small, in great Numbers, and almost like Cypress or Tamarisk, but thicker and more sharp or prickly, of a very strong, but yet not unpleasant Smell. It is said to be Bitter, because it is seldom seen to bear any Seed or Berries with us, but Lobel says, that it does bear Berries, which, but in a few Places and but seldom, and holding the Fruit on its Branches all Winter till green. Fruit grows on them again the next Year, and this is confirmed by good experience. In Cordus, Dodonaeus, Fuchsius, Geofere and Lugdunensis do testify: in its Native Countries it bears small Black Berries like unto Juniper.

IV. The second or Berry bearing Savine. This is the greatest plant of the two, it grows not so much as the former, but grows somewhat higher, as to the height of four, and sometimes of six feet, spreading far forth Arms and Branches fully furnish'd with Leaves, which at their first coming forth, are somewhat like unto Tamarisk Leaves, but being grown old, are more like unto the Leaves of the Cypress Trees, hard and prickly, and of a dark green color, with an eye of blem flattening them, having a left strong smell, and nothing so sharp as the common Kind before described. It has not been observed to bear any Flowers, but small round Berries, like unto Juniper Berries, but larger, and of a sharper taste, black when they are ripe, with an eye of blem upon them, like to the Juniper, or those of the common Savine before described, which Berries remain on the Branches all Winter also, till new green ones come upon them again.

V. The third, or Savine Gentle, or greater Berry bearing Savine. This grows somewhat higher than the second, with esp, spreading out more slender and weak Branches, on which are set small and long Leaves, of a more pleasing and gentle smell than the others. On the Branches among the Leaves, come forth such like Berries, as on the other, and very like unto Juniper, black when they are ripe, and but a little bitter to Taste, not altogether unpleasant.

VI. The Places. The first is planted in our English Gardens almost every where. The second and third grow upon Hills and in Woods in Candy, Alba, and in other parts of Greece, and other those Eastern Countries. The third on Mount Temen, Olympus, and Asunciun, as also upon the Mountains in Apulia and Cilicia, as also upon the Plains of the Alps, near unto Gratiosimple, Gerard says, that both these latter grew in his Garden. They are all planted by the Sea, but the second both by the Sea and the Sips, which must be set in a ground somewhat Moiit and Shadowy, till they have taken Root. The Plants growing from the Sips, decline towards one side, full retaining the Nature of the Bough; but the Savine which is produced by the Seed grows more upright.

VII. The Times. Thef all of them, continue always green both Winter and Summer. And those which bear Berries, have them ripe common in Winter, but they have fruit at all times; for before that the old Berries fall off, new come on upon the same Branches.

VIII. The Botanizer. Savin is hot and dry in the third degredent of habit parts: Aperitive, Ab-}
The Virtues.

XI. The Juice or Essence of the Leaves. They are of this part, and by reason of their strong drying and heating qualities, they have no confolating or glowing property in them, but by reason of their great astringency, they digest more, and are purgative as powerfully as the preparations of the Cyprians, mixed with Honey and applied, they cleanse the mouth of Ulcers, and take away their blackness, and break or dissolve Caruncles, or Plague Sores. They provoke the Cries, and force away both Birth and After-Birth. They are also probable against the Kings-Veil. Dose one or two Spoonfuls more Morning and Night, in a Glass of Water or Rhubarb Wine.

XII. The Decoction in Wine or Water. It has all the Virtues of the Juice or Essence, but much weaker, taken to half a pint, it expells blood by Urine, and is probable against the Stone, Sand, Gout, or any Obstructed Muscles in the Renis, or Urinary parts. Given with 30 Drops of Spirit of Hartshorn, or Tartarated Sul-Amoniac it is a proper help against the Plurifie, and Wind Colic, &c.

XIII. The Powder of the Leaves. It has the Virtues of the Juice, Essence and Decoction, and may be given from half a Dram to a Dram, in any proper Vehicle, and given as a Specific to Kill Worms in Children. Take Sowings in Powder a Dram: Nine finely powdered 3 Ounces: Honey 2 Ounces, mix them. It wonderfully helps teeth as are Allatriack and short willed, being taken upon a Knife point morning and night.

XIV. The Pame. It is made of the Green Herb cut small and hung upon live Charcoal, received up the Body wise or without a Furnace: it induces the Terms, and Lochehs flipt, the Birth, and Facilitates the Delivery.

XV. The Decoct Oil is a little clearer, is good against Tumors, and Kings-Veil, Swellings, and is said to Kill Worms in Childrens Bellies being anointed therewith.

XVI. The Ointment. It is made of the Green Herb, as is said after which, to every pound of the Ointment 9 Ounces of the fine Powder of the Leaves is added. It has all the Virtues of the foregoing Oil, and is more powerful than that to all Infections, joined on the Heads of Children which are vehemently Sackby, commonly called Scald Heads, it thoroughly cleanses them, stops their running, drys, and particularly heals them, and is good against Antihenidies.

XVII. The Cataplasma. It is made of the Green Leaves by bruising them in a Mortar. Laid up on old Ulcers, running Sores, and fretting Canker, and such like, it digests, cleanses, removes their malignity, dries and heals them, being first Bathed or Waffled with a strong Decoction of the Leaves.

XVIII. The Distilled Water. It is a proper Vegetable to convey some of the former Medicines in: it is also of singular good use to cleanse the Skin, and clear it from inflamations, spots, marks, and from other like deformities, and is probable for the Vertigo, or a Giddiness of the Head and Brain, being taken inwardly and night to a Quarter or more, intermixed with double refined Sugar.

XIX. The Distilled Oil. It powerfully provokes the Terms, haffens and facilitates the Birth, forces away the After-Birth, and dead Child, provokes Urine, gives ease in the Stone, Gravel, Strangury, or any Obstruction of the Urine, gives present ease in the Colic, and is probable against the Plurifie, as also the Gout procures, and expels from a cold cause, being anointed thereon. Dose from 2 Drops to 10, Drops into fine Sugar, and do drink, with a quarter of a Pint of the Distilled Water, or more other proper涼.

XX. Oleum Sabine, Cuscinum, Myrtifoli, Muschific Oil of Savin with Saffron. Take of the former Distilled Oil of Savin 3 Ounces, Orienta Saffron 3 Ounces, Myrthilia 2 Ounces, redilshed Spirits of Mergus, Century 1 oz, and Senna, and Crocinum, of each one Ounce, 4 to 10 days, then alwufs the Spirit and keep the Oil for use. It is a most excellent Oil, and much more powerful for all the Intention. It may be given morning and evening (after due purging) from 31 drops to 3 in Rheumh Wine, or some appropriate Water or Decoction.

XXI. Poteaties, Or the Powers of Savin. These are possibly one of the greatest Hydriks in the whole Vegetable Kingdom, for suppers Vapors and curing. Fits of the Mother. They are admirably Nervous, and cure cold disaffections of the Head, Brain, Nerves and Womb, proceeding from too much moisture. They are of thin and fulbip parts, provoke Urine and the Terms, haffen the Birth, force away the After-Birth, and expel the dead Child if any be. They open and cleanse the Womb so powerfully, that they are not to be taken by Women with Child, lest they cause Abortion or Miscarriage. And yet they have this Excellent quality (if a Woman is not with Child) as well to comfort and strengthen the Womb, as to open and cleanse it. That they potently provoke the Terms when Noyt, yet when they flow too much, they will as well flop them again, because they warm, comfort, and strengthen the Nerves and Womb being very Nervous, it receives the fame advantage thereby. They famously ease pains, in what part of the Body ever, especially tho' thole of the Colic, of the Stone, and cold Ulcers, and all such as proceed from Cold, Bruises, Swellings, Ornaments, or other Contingent causes. They are of extraordinary force in Curing Barreties in both Sexes, but chiefly in Women, for they warm, comfort, strengthen and enliven the Instruments of generation, acuate and enliven the Seed, making it brisk, potent and fruitful, and that in both Men and Women. They cure Cramps and Convulsions, as also cold Ulcers and Scabs, and strengthen all the parts weakened by those disaffections, or any external Violence. They cure the Palms, trembling of the Hands, Arms, or Feet, and the tumefied-ness of the Parts, if it be inwardly in double doses, and he also outwardly applied to the parts affected, as also bathed on the back Base, as often and as long as the Vehemency of the disaffections requires, and in part thereon. The Preparations andDirections, a A Dye. They may be given from 30 to 60 or an 100 Drops, yea to half a Spoonful or more, if
Chap. 621.  English Herbs.

Savory Winter.

Savory Summer.

The Descriptions.

III. The first, or our Winter Savory. It has a

Woody Root, with divers small Offices, adjoining to it, and abides with green Leaves all the Winter, which is more easily encroach'd by Jipping or avoiding the Root, and new setting it again in the Spring, than by fowing the Seed. It is a small

Lost, and Booby Herb, very like unto Hyfop, but not much above a Foot high, with divers small

hard Branches, and hard dark green Leaves, being,

as thick Jet as the Leaves of Hyfop, and some times with but four Leaves at a Joint, of a

toxicable strong, aromatic or sweet smell, yet not so strong or sweet as the Summer kind follow.

The Flowers are of a Pale Purplish color, yet at several distances, towards the tops of the Stalks, and with Leaves also under them.

IV. The second, or our Summer Savory. Its

Root is Woody, and has many Sprigs, yet stouter than the former, which perishes wholly every year,

and must be Sown again every Spring, if you will have
Salmon's Herbal.

Lib. 1

There is a small tender herb, growing not above half a yard high or thereabouts, rising up with diverse brittle Branches, slenderly or fcarcey set with small, long narrow Leaves, two at every joint, one against another, soft in handling, and of a pleasant, strong and quick smell and taste, tenderer, sweeter, and more pleasant than the former. The Flowers are small and purplish, growing on the tops of the Stalks, and with two small long Leaves at the joints, under them. The Seed is small and of a dark color, and larger than True Seed by half, which may be sown every Spring for the encrease of the Herb.

The Thirtieth. Drosorides his true Savory of Candy, Its Root is somewhat woody, long, and hard, with some small blackish tubers springing from it, and will as hardly endure the Winter with us as at the left, although the lower branches which rise on the ground are apt to take Root, which fruits, in its native place of Growth, where it feels no cold Winter, it can by that means forced, and causeth it self. It branches from the ground like Time, with many purplish square Stalks or Branches, covered over with a thick or hairy down. From the lower joints of the Stalks come always two Branches, and two Leaves set at them, and so in the like manner all along the Branches, two at every joint one against another on the contrary side, and are very like unto the Leaves of the true Time. But something longer and a little hairy, of a sweet smell, and sharp taste, between those of Time and Savory. On the Tops of the Branches, at certain distances one above another, grow forth heads or Tufts of green Leaves, from among which come forth many purplish flowers, like to those of Time, standing on brownish basis. The Seed is of a blackish brown color, and very like sows to the Seed of Time.

VI. The Fourth, or Rock Savory. It has a somewhat long and woody Root, with tubers adjoining to it inward to its inner end, from which rise up many slender, hard, and woody Stalks, about a foot high, on which do grow at several places, many very small and narrow Leaves, very like to the Leaves of the true Time, but something longer, of a sharp quick Tafle, and of a strong sweet smell. At the Tops of the Branches come forth many fabled heads of small Flowers, and out from among them come forth purplish Flowers, which afterwards yield a small brownish Seed, more like to the Seed of Time than of Savory. The whole Plant will be sometimes, of a fair purplish color, in a year with a white mealing, as for the most part all Sea plants are.

VII. The Plant. Thefe Plants grow wild in several parts of the South of Europe, and in Asia, especially in Groves, where many times they are to be found very plentifully, but with us they all grow in Gardens.

VIII. The Times. They all Flower the firft year of their Planting or Sowing, the firft two and the fourth in July and August, the third (in its native places) in October and November.

IX. The Qualities. They are all hot and dry in the third degree; Alterative, Aperitive, Affriving, Attractive, Commiffive, Digestive, Diuretic, Cephalitic, Neuralitic, Pasteurial, Cardiatic, Hyfletic, Pyrastic, Emmenagogick, Alexipharmick, and Analgetic.

X. The Specification. Savory expells Wind, is good against the Colic, Vapors, and Pain of the Mother, provokes Urine and Women, cured up Luft and caufeth Fruitfulness in both Sexes, it caufeth a good Appetite, and as good a Digestion, taking away loathing, and an inclination to vomiting, it caufeth tough flegm in the Blood and Lungs, and helps to expel fome of the Vapors, and fome other cold and moft Diftembles of the Head, Brain, Nerves, Worms, and Joints, as Gout, Scotitis, &c.

The Virtues.

XII. The Juice or Effeence. Taken from an Ounce to two Ounces in a Glafl of Curaty or Madera Wine, it gives ease in the Colic, provokes Urine and the Courfes, and excited Luft in both Men and Women. They cut tough flegm in the Blood and Lungs, and caufe an easy expeferation thereof, the juice being ufed as an Elixir, by ufling it up the Neftrils, enlivens the Spirits, takes away dullefs and heavines, and is probable against a Cares, Leebhang, and other ftrep disfames, by drawing our, and purging the head and brain of cold, vitious and P eruptive humors; and drops into the Eyes, it is a good Ophthalmitic to clear the Sight. It proceeds of thin cold humors diffilling from the Brain.
Chap. 622. English Herbs.

Brain. The same Juice or Essence, mixed with a little Oil of Roses and droped into the Ears, it easeth their pain, and takes away Deafness, Noise, and Singing in them.

XII. The Digestion or Infusion in Wine. It has the former Virtues, but is weaker and therefore may be given to 4, 6, or 8 Ounces at a time; it is good against loathing and Vomiting, creates an Appetite, and caueth a good Digestion.

XIV. The Powder of the Leaves. It may be given to a Dram at a time, morning and evening either in a Glass of Wine, or mixt with Honey, or some proper Syrup. It has the Virtues of the Juice, Essence and Decotion, but operates not with that Celebrity and Excellency as they do, by reason of its earthy Substanee which very much clogs it; besides it must be first digested in the Stomach before it can exert its Virtue in remedying those Diffemters against which it is given.

XV. The Comfitfer. The Juice made into a Poultice with Wheat Bread, or Rye Bread, and applied to the Joints or Hips, is said to give ease and to the raging Pains of the Croup and Scorica, as also difficulre Simple contusions, and takes away the Stinging of Bees, Hornets, Wasps, &c.

XVI. The Spirituusus Tincture. It is excellent against the Collick, and all Windy Diffemters in the Stomach and Bowels; it is good against Hydrochondriac Melancholy, and prevails against Fainting, Swallowing, Complings, Verigo, Lebargy, and other cold and moist Diffemters of the Head, Brain and Nerves, and has all the Virtues of the Juice, Essence and Decotion of Infusion. Dole a quarter of a Spoonfull at a time Morning and Evening, in a Glass of Generous Wine.

XVII. The Acid Tincture. It is a most admirable Stomachick, not inferior to that of Mint, it is good against an Affhima and torments of Breath, caused by Obstructions of the Lungs thro' Flagm and other cold and Vivid Humors, inclosing or cutting them, and so caueth them to be easily Spirt up. It is profitable against all Burning, Malign and Peltifical Fevers, and even against the Plague it self; refuits Poison and the vivid of Vi- pets, Rattle-fitches and other Venomous Creatures, it often affumeth an excellent Appetite to Food, and caueth a good Digestion thereof, strengthening af- ter aingular manner the Tone of the Stomach. Dole so many Drops as to give a Glass of Wine or other Liquor a grateful acridity, and to be repre- serted 3, 4, or 6 times a Day or other.

XVIII. The Spirit. It is a singular Stomachick and Cordial, good against Fainting and Swooling Fits, Pains of the Mother, pains and gripings in the Stomach and Bowels, and all the Diffemters of the Vfipers proceeding from Cold, Molliuere, Wind, and Obstructions. Dole from a Dram to two Drums in a Glass of Wine.

XIX. The Oil by Diffillation. It may be given from 3 Drops to 10, being droppt into Sugar and mixt well therewith, and then put into a glass of Wine or other fit Vehicle to be taken in. It is good against Vapours, Fits of the Mother, Ob- structions of the Terms and other cold and moist Diffemters of the Womb. It warms and con- trollers the Inflammations of Generation, excites Luft, and is said to Cure Barmenck in both Sexes. It facilitates the Delivery of Women in Labor, brings away both Birth and Afterbirth, and either prevents or cures after-pains caueth either by heat or Labour, or raking Cold. It is also good against all cold or moist Diffemters of the Head and Brain, as vehen-
Salmon's Herbal. Lib. I.

Salmon

The fist is common in the corners of fields and Wood sides, both open and Shadowy; that with a White flower has been found growing at the fatick end of Humphred Wood, near unto a Rill of Water, running by the side of a Cottage there; as also upon Water Down Forrett in Saffex, next unto the path which leads from Bridge unto Ivy Bridge by a Brook side. The fist is not so common to be met with.

VII. The Times. They all Flower in July and August, or towards the end of Summer, and the Seed is ripe not long after.

VIII. The Qualities. Saw-wort is hot and dry, in the end of the fist degree, or beginning of the second; Alkherie, Alkherire, Anodyne, Vulgarly, and Aurickus.

IX. The Specification. It heals Contusions, Green Wounds, Old Ulcers, Hemorrhages, Coflick, and all inward Tonments of the Bowels, Ruptures, Hemorrhoids, or Piles, &c.

X. The Preparations. You may make thereof, 1. A Juice or Essence. 2. A Decotion or Infusion in Wine. 3. A Powder of the Leaves. 4. An Oil or Ointment of Herb and Root. 5. A Capsamia of Herb and Root. 6. A Pimento.

The Virtues.

XI. The Juice or Essence. They are Singu-

larly good for such as are Bruised by a Fall, and have thereby any vein broken within them; or are much Bruised by cruel Blows, or other-

wise much hurt by any violence or over the Fainting or lifting, they ease their Pains and Sores, and Rop the field inward Bleeding, by conglutinating the mouths of the Veins. And for the same reason they are commended to heal Ruptures, or Burstanachs, being as well taken inwardly, bathed warm outwardly upon the Place. They are good also for all Wounds new or old, to cleanse, dry, heal, and consolidate them; or being old and filthy Ulcers, to digest, cleanse, incarnate and Cicatrize them, they being often vaited therewith, and after washing, the Ointment or Balsam of the same Herb being applied.

XII. The Decotion or Infusion in Wine. They have all the same Virtues with the Juice and Es-

sence, but much Inferior, as being weaker in their effects, and therefore may be given from a quar-

ter of a pint, to half a pint, morning and evening, or before which, they are of good use against the Coflick or Gaping's of the Guts, and inward Pains and Tonments of the Bowels proceeding from Wind or Starl Humors.

XIII. The Powder of the Leaves. Inwardly given (in any fit Vehicle) to a dram at a time, morning and evening, it has the Virtues of the Juice or Essence, but operates not with their fixed, nor does it pierce so far, nor so effecti-

ably, but is an extraordinary thing for the pres-

tent Bopping or pissing of Blood, or of a Bloody Flux. Outwardly, it stops bleeding also, heals green wounds; and cleanses, dries, and heals old running Soaks, and foul Ulcers though of long standing.

XIV. The Oil or Ointment of the Herb and Roots. They safe pains in any external part, be-

ing anointed upon the same. And the Ghee infused in Water is good to heal Green Wounds, they being first washed with the Essence or Decotion, then Broomed over with the Powder, and after all the Oint-

ment.
Chap. 623. English Herbs.

Saxifrage English Common.

Largely spread, not much unlike to Sefeli pratensis moschatum, and of a deep green colour, the Stalks bear at the Top the Umbels of small Whitish Yellow Flowers, and the Seed after them is like to Common Venus's-Seed, both for form and magnitude, but of a brownier colour, and differ from one another.

The third, Or, Marsh Saxifrage, or small Water Saxifrage. Its Root is small and Fibrous, growing in the Mire with its Strings. It rises up from the Root, with several very small grafts like Leaves, about an Inch long, very small and narrow. (a great deal smaller and weaker than small Plants, says Gerard) from among which spring up divers slender, round, smooth, conical Stalks, about two or three Inches high, full of joints, which are sometimes branched here and there with small Branches: at the Joints of all which Stalks and Branches grow small Leaves, many together almost like the former (but two or three inches longer than the right) for by couples, with others shorter coming forth of their branches, which Leaves the higher they grow, become the Top, green ribs shorter and shorter.

The Description.

IV. The fifth, Or our English Saxifrage, specially so called. It has a Root which is long, thick, Black without, and White within, and of a good flavor. It rises up with Stalks two or three feet high, and sometime from its Spring Stalks of Winged Leaves, finely cut, almost like to Fennel, but thicker and broader, and not so

Tops being applied spread upon fine Tow, and by the same manner they dryd, cleaned, incasned, dry, and heal foul running Sores, and old foul Ulcers, if drif therewith twice a day.

XV. The Catalogue of the Herb and Root. It is good to heal simple Contusions as also simple new Wounds; and to cleanse hurt and purify Sores. And to Confortable Ruptures in Children and Young Men, being applied to the part, after baking of the Fame with the Juice or Liffence.

XVI. The Fomentation. Take of the Decotion or Infusion two parts, of the Juice or Essence one part, mix them. It is of singular effects in eating the Hemorrhoids or Piles, when they are very painful, by fomenting them therewith very hot for an hour together, twice or thrice a day; and if they be very full of Blood, after the fame have been applied, by fomenting them very hot, it perfects the Cure.
Small Water Saxifrage.

so that the Top of this Plant resembles the hard branched Thyme. At the Tops of the Stalks and Branches grow the Flowers, which are white, and consist of five round pointed Leaves, with some small Circles in the middle, which Flowers are great, confiding the finenes of the Plant.

VII. The fourth, or great Italian Saxifrage. its Root is long, and Woody, with some Fibres adjoining to it, from which Springs forth a great Woody Stem, of the thickness of a man's finger, which is full of Cells as it were below, which spread it; so that you may very thick, with many slender hard which Branches fall of Fruits, and two small whish green pointed Leaves set at every Joint like unto Pinks, and many other smaller and shorter growing with them. The Flowers stand at the Tops of the Branches, out of white greenish bunch, consisting of five, and sometimes six, small white leaves, uncurled at the ends, of a secret fault, standing above the bunch, and laid open like a little Star, after which follow small round and somewhat long heads, full of small reddish round Seed, much lesser than that of Poppy: but this Plant grows not wild as in England, so great and Woody.

VIII. The Polygon. the first grows in Fields and Medows, in most places of this Kingdom. the second and fourth, in the West parts of England at Lobel says, who relates in his Advertens, that he found the second between Chippenham and Malmouth in the high way from London to Bristol, on a Chalky hill. The third Mr. Godfrey found on a boggy Ground below the Red Well of Wellesborough in Northamptonshire. The fourth, also Matheus Fidy grows on Mount Badon in Italy.

IX. The Tincture. the first Flowers from the beginning of May, to the end of August. the others flower (all of them) late in the Year, as in July and August, and their Seed is ripe not long after.

X. The Qualities. Saxifrage is hot and dry in the third Degree, Aperitive, Absterrive, Anodyne,

Carminative, Digestive, Diuretic, Neurotic, Stomutick, Nephtick, Hydaletic, Emmenogonic, Alkaphamnic, and Lithuronic.

X1. The Specification. It is good against the Strangury, Sand, Gravel, Stone, and Tartarous Muelage in the Reins, Ureeters, and Bladder, to expel Wind, give cafe in the Colick, provoke the Terms, &c.

The Virtues.

XIII. The Juice. Drink from 2, to 4 or 6 Spoonfuls in White Port or Lisbon Wine it provokes Urine powerfully and is said by Authors to break and expel the Stone in the Reins and Bladder, which I suppose to be a Gritty stuff for that of a Flint-like Substance, can never be broken by a Med'cament; and to expel it, as also Gravel, Sand, or any Tartarous matter in those parts.

XIV. The Essence. It has all the Virtues of the Juice, besides which it expels Wind, is good against the Colick, provokes the Terms, in Women, instigates and facilitates the Birth, strengthens a weak Back, and eases the Pain thereof. Dose from 2 to 4 Spoonfuls. If taken with Honey, it eases Coughs, and causes Expiration.

XV. The Decoction in Wine or Water. It is made of the Roots and Herb together, and has all the Virtues of the Juice and Essence, but must be taken in much greater Quantity, because it is weaker in Operation. as from 4 to 8 Ounces, or from a quart to half a Pint Morning and Night, sweetened with Honey or Sugar.

XVI. The Powder of the Seed and Root. Taken at a dram at a time morning and night for a month together, it eases the Pain of the Reins and Bladder, proceeding from Tartarous matter, Sand, Gravel or Stone, provokes Urine, gives eafe in the Colick, and has all the other Virtues of the Juice and Essence.

XVII. The Distilled Water. It is of the same Nature, and has the same Virtues with all the aforementioned Preparations; but as it is much weaker than any of them, so it is given in greater quantity: you may give half a Pint or more at a time morning and night sweetened with Honey; but it is chiefly used as a Vehicle for other Preparations.
CHAP. DCXXIV.

Of Saxifrage White and Golden:

OR,

BREAKSTONE.

I. THE Names. These were, as far as I can
find, unknown to the Greeks. The Lat-
tines call them Saxifraga alba, and we in English
White Saxifreges.

II. The Kinds. We shall describe the three
following Varieties. 1. Saxifraga alba Vulgaris. Saxi-
fragas alba Chelidonides Lolobii saxifraga
rotundifolia Bauhini, Saxifraga radice tuberfie
Clofch, Out Common White Saxifrage. 2. Saxi-
fragae alba bulbs altera, & bulbifera Montana
Columna, Saxifraga affinis bulbos petros Bauhini,
Mountain White Saxifrage. 3. Saxifraga auris
Gerardi, Saxifraga Lichenis satie & Natalitii
Lolobii, Hepatica Palustris Belleri, Chrysophle-
nium Tabernemontani, Our Golden Saxifrage.

The Descriptions.

III. The fifth, Or our Common White Sax-
ifrage. It has a few small redish Kernel Roots,
covered with some hooks, lying among many small
blackish Fibres, which send forth several round
faint, or yellowish green Leaves, of a grassy co-
lor, underneath, lying about the Ground, unequally
indented about the Edges, and something hairy,
every one growing upon a small Root Stalk, from
thereon rises up a round brownish hairy green
Stalk, two or three Feet high, with a few such
like round leaves thereon, as green below, but
smaller, and armed at the Top, between fluted
pretty large White Flowers, consisting of five
Leaves a piece, with some yellow Threads in the
middle, standing in long crisped brownish green
Husk, After the Flowers are full, some time,
ariseth a round hard head, by forked at the Top,
in which is contained small blackish Seed, which
slowly fall away without any Seed at all. That
which is commonly called White Saxifrage Seed,
are the Kernels or Grains of the Roots, which
are always used for the same.

V. Gerard describes the foregoing Plant after
this manner. It has a Root compell of a Number
of black Strings, whereunto are joyned very many
small reddish grunny, or round Roots, as big as
Pepper corns, which are used in Medicine, and
are called Seenum Saxifrage alba, or White Saxi-
fragae Seed. From this Root spring up round
Leaves spread upon the Ground, and somewhat
rigged about the Edges, not much unlike the
Leaves of Ground Ivy, but softer and smaller,
and of a more faint yellowish green. Among
which rises up a round hairy Stalk a Cubit high,
hearing at the Top small white flowers, almost
like Stock Gillflowers. The Seed follows the
flower which is small, and contained in little
Husk.

The Saxifraga White.

Saxifraga White Mountain.
Salmon's Herbal.

Salmon's Herbal.

Lib. 1

Saxifrage Golden.

Saxifrage Golden.

(Vom the Carter has omitted in the Figure.)

A small round reddish Seed. The whole Plant is almost inquisit, or without Taffet, and nothing but, which does not flow any property it has to operate upon the Stone or Gravel, either to dissolve or expel it, unless it be by some occult or Specifick Quality. It can scarcely be thought that so many Authors as have wrote of it should ascribe a Stone Breaking property to it, unless it had been confin'd to them by such Practice and Experience, but I having observed nothing concerning it, shall say no more of it at this time.

VII. The Places. The first grows plentifully in many parts of England, in the lower mott, as also in the upper dry corners of Medows, and Gaolily Sandy Places. It is Gild that it has grown on the back side of Greys-Inn, not far from Lamb's Combat Hed: also in a Field on the left hand of the high way going from Thomas Waddington unto Depfield near London: in the great Field by Whittington called the Montes: in the Green Places by the Sea side at Lowest all, among the Rutes in George Fields near Southwark, and in thousands of other places in this Kingdom.

The second grows on the Hills and Mountains of Italy in the Kingdom of Naples, and I have been informed by a Traveller and singular Harriett, that he has found it growing on some of the Hills and Mountains in Wales. The third grows in Mooll places by Well sides, or other standing, and sometimes running Waters, and sometimes also in Moorish or Perty Grounds: as about Tidmouth in the Parish of Deen, at Asford and Eden in Kent, in moist and Marsh grounds about Bath and Wells, in the Penns and Moors by Ballyon in Lincolnshire, and Wisbic in Cambridgeshire, at Chiffield in Kent, and abundantly in the Shadowy Molift Rocks by Medford in Hampshire, as also in the like places in Yorkshire.

VIII. The Times. They flower Sometipes in April, but generally in May, in which Month the first is gathered for the Grains or Kerne upon the Roots, or th'ofe upon the Stalks, as also for Distillation, quickly withering away when any heat comes. The latter continues Green all the Year.

IX. The Qualities. The first and second kinds are hot and dry, in the second degree, Acidive, Incline, Diuretisk, Neuritick, Stomackick, Nephitick, Hyderick, Emmenagogick, and Lithon-trigick.

X. The Specification. It is peculiar to break or dissolve the Stone in the Reins and Bladder, and to expell it, and cleanse those parts, Tarrinous Substances, or obftructive matter lodg'd in them. It gives ease in the Strangury, provokes Urine and the Tones powerfully, and cleanses the Stomach and Lungs from Pleurous humors offending them.

XI. The Preparations. You may have there-from, 1. A Juice or Essence of the Leaves and Roots. 2. A Distillation of the same in Wine or Water. 3. A Powder of the small Kerne Seeds. 4. A Distilled Water of the whole Plant, Roots, Stalks, Leaves, and Flowers.

The Virtues.

XII. The Juice or Essence. They cleanse the Reins, Ureters and Bladder, and are Gild to break or dissolve the Stone, (if conflicting of a Catarrh Contagion) in those parts, and to expell it, as also Sand, Gravel, and Musculagineous Matter, of which the Stone is bred. They cure the Strangury or pitting by drops, and provoke Urine to adnation, open obstructions of the Lungs, and Womb, and provoke the Tones, cleansing the flame from the Pleurous matter lodg'd in them. Dose from two Spoonsfuls to four or fix in White Port Wine, or in the Distillation of the Leaves and Roots.

XIII. The Distillation of the Leaves and Roots in Wine or Water. It has all the Virtues of the Juice or Essence, but less powerful and therefore may be taken from a quarter to half a pint at a time, Morning and Night, for a Month together, sweetened with our Syrupus Naphriticus, or with destumated Honey.

XIV. The Powder of the Kerney Seeds commonly called the Seed. It may be given to a Drain, or Drain and half in White Wine every morning Elixing, and at Bed time, for 40 days together, for all the Intentions and purposes for which
which the Juice or Essence are given. It mixed with 
Honey and so taken, it is an Excellent thing to 
open Obstructed Lungs, and to cause a easy 
expectoration of the Putridous matter afflicting 
them.

V. The Distilled Water of Roots, Leaves, and 
Flowers. It has the Virtues of the Juice and 
Essence, but in a much inferior degree, and may 
be given half a Pint at a time, sweetned either 
with our Syrupus Nepthiricus, or with Clarified 
Honey, and so taken Morning, Noon, and Night.

It eases Purgm to be easily voided from the 
Lungs.

CHAP DCXXV.

OF SAXIFRAGE Burnet.

I. T H E Nomes. The Ancient Greeks and 
Latinum knew nothing of this Plant: Our 
Modern Authors have call'd it, Pimpinella Saxi-
frage: And we in English, Burnet Saxifrage.

The Kinds. The following are the Chief, viz.: 
1. Pimpinella Saxifrage major, oris, Our 
Greater English Burnet Saxifrage. 
2. Pimpinella Saxifrage minor, oris, Pimpinella Saxifrage 
re-
nellus Beadini, Our Smaller English Burnet Saxi-
frage. 
3. Pimpinella Saxifrage hircina major, oris, 
Pimpinella Cordi, oris, Gefenrii, Lobelli, Tragi, 
Pimpinella Saxifrage Matthesii, Camerarii, Saxi-
frage hircina Gefenrii or Claffe, Bipinella Lowara, 
Bipinella Saxifrage Lobelli, Tragelodium majus 
Teburnennani. The great German or Hircian 
Burnet Saxifrage. 
4. Pimpinella Saxifrage hircina minor, Saxifraga 
hircina minor, Pimpinella Tragi; Dower felmonon 
Cordi, Dower tertion genus Luguenonti, Tragiun 
Disporis Calmari, & Pimpinella minor, by divers, 
The small German or Hircian Burnet Saxifrage.

The Descriptions.

III. The Gmst, or our great English Burnet 
Saxifrage. It has a long whitish Parfynp like Root, 
of a hot and biting Taffe like Ginger, which con-
trasts many Years. It grows up in the same manner 
like the great German Saxifrage at Sel. V. follow-
ing, having an hollow Stalk two or three Feet high, 
with joints and kner, but with large Winged 
Leaves, which de more nearly resemble Smallage 
than Burnet, which consists of many small Leaves 
growing upon one Stem, slmly or dented about the 
Edges like a Saw. The Flowers grow at the tops 
of the Stalks and Branches in white round Tuffts, 
Umbels: The Seed is like Common Parsly Seed, 
sawing that it is bitter, and biting upon the 
Tongue, being sharper and better than that at 
Sel. V. following.

VII. The second, or our smaller English Burnet 
Saxifrage. This is the best known of all the rest. 
Its Root is long and white, smaller than the former, 
and puts its forth forth into Branches, being of a hot, 
sharpe and biting Taffe also. It springs up 
with Leaves almost like unto Burnet, or Common Parsly 
of a dark green Color, and smooth or sick of hairs, 
which if tenderly broken with your Hands, you may 

draw forth small Threads, like Stings of a Spider,
and fast as you may draw from the Leaves 

of Saxifrage. The Stalk is hollow, divided, it falls 
from its joints or Knos, into several small 
Branches, at the Tops of which do grow small Taffts 
or Jouble Umbfels of white Flowers, after which 
comes the Seed, of a hot sharp Taffe, like to that of 

Garway.

V. The third, or great German or Hircian Burnet Saxifrage. Its Root is small, long and white, 
very like unto a Parsley or rather a Parsnup Root, 
but much hotter in Taffe, which perfumes not after 
Seed time, but endures several Years. It springs 
up with several large and long Stalks of Winged 
Leaves, one set directly opposite to another, on 
both sides the middle Rib, each being somewhat 
broad, a little Pointed, and somewhat deeply dent'd 
about the Edges, of a fresh green color, almost film-
ing. From among which rise up one or more round 
hollow Stalks, three feet high or better, set at the 
joints with the like, but differ Leaves, and bear-
ing at their several Topps, small Umbfels of small 
white Flowers, after which come small, black, 
rond Seed, like unto Parsley Seed, but much hotter 
in Taffe, and sharper upon the Tongue. The 
Leaves of this Species are proper cut in or dented 
than our great English kind at Sel. III. above, and 
at left double their Breedth, they both being in-
vented after the same manner.

VI. The fourth, or great German or Hircian 
Burnet Saxifrage with a Reddish Flower. This sort 
differs little or nothing from the former, neither in 
its Roots, Stalks, Leaves, Branches, Flowers, nor Seeds, 
nor yet in its Magnitude or form of Growing, owing 
only that the Flowers in this are of a reddish, or 
blush color.

VII. The fifth, or smaller German or Hirci-
nian Burnet Saxifrage. Its Root is long and 
White, but smaller than the Roots of the two 
last described, also more hot, quick, and sharp,
Salmon's Herbal. Lib. 1.

as is also the Seed hereof. It has several shorter Stalks of finer cut Leaves by much than those of the third and fourth kinds, every one set against each other, being very narrow and much cut in, or deeply dented about the edges, which makes the Lovel seem as it were made of many fine cut and jagged Leaves, set on both sides of a middle Rib, or Stalk, which sometimes grows Reddish, and is very near of the same fresh green color which is seen in the third or great German kind before described. The Stalks rise as high almost, and the Umbels of Flowers are white like those: the Seed also is blackish, but smaller than the Seed of that third Species.

VIII. An Observation Parkinson says, that there is growing at the Roots of these Saxifrages, in some Countries, certain Grains, which will give a Scarler Dye, as Lacuma and Angolaia have related, and by these called Coenus Radicum: but Amatus Lusitanus says that the like Grains are found at the Roots of many other Herbs. Tragus calls this Saxifrage Piper Germannicum, and says that no other Plant can be more truly referred to the Patria Germanica; and in some cases it was so compared to the Seed of Ammos, yet to be seen, and in some alike to Spices, being very small and in Tuples; and truly the Seed hereof is like Aromatick, and very sharp and piercing vitall, but he bad Reason to say as he did: And Gerard says, it answereth to the true Phellandrium of Pliny, more than any other Plant.

IX. The Places. The two first are found growing very plentifully in molt Medows throughout England, and are chiefly seen of such as know them, and look for them, tho' they lie hid among the Grass, and often times fezily to be discern'd. The other three grow in the Fields, in Germany, as also on their Mountains and Rocky Grounds, but very much in Syria Hercynia, or the Hercynian Wilder-woods or Woods, from which place it takes part of its Name: Yet notwithstanding, they have been found by divers, to grow as well in England as in their other places.

X. The Times. They all flower from the end of June to the end of August, and their Seed ripens in the mean Season.

XI. The Qualities. They are hot and dry in the end of the third degree, being indeed as hot as Pepper, and (as Tragus says by his own experience) more wholesome: They are of thin and subtil parts, being Incensive, Aperitive, Alleviative, Inactive, Carminative, Digestive, Diffusive, Diuretik, Colinctic, Neuritick, Stomatiek, Nephritic, Hysterick, Hydratic, Lymmeagetic, Lithonripetic and Alecrhythmick.

XII. The Specification. They provoke Urine and the Terms, give ease in the Strangury, cure the Colic, expel Wind from the Stomach and Bowels, are good against pains and fits of the Mother, break or dilate Gravy Stones, in Reins and Bladder, and expel the Lumps, relish and expel Poison, strengthen the Stomach, casting a good appetite and digestion, and an Expelation of cold Putrious Humors from the Bladder and Lungs. They are also Cataplastik, freeing the Skin from many Deformities.

The Virtues.

XIV. The Juice of Leaves and Roots. It provokes Urine and the Terms powerfully, facilitates the Birth and expels the Afterbirth, gives ease in the Colic, and breaks or dissolves Gravy Stones in the Reins and Bladder, expels Vapors, and helps fits of the Mother. Dose from one Spoonfull to three, Morning and Night, in a Glafs of white Port or Lisbon Wine.

XV. The Infusions. It strengthens the Stomach, fortifies the natural faculties, creates a good appetite and a strong Digestion, and is an excellent thing against Coughs, Colds, Asthma, the Throat, Breast, Hoarsness, Wheezing and other cold and moist Dileases of the Bladder and Lungs, and has indeed all the other Virtues of the Juice. Dose one or two Spoonfuls sweated with Syrupes Nervitis, or with Honey, Morning and Night.

XVI. The Infusion or Decoction of Wine or Water. They are given for all the former purposes, from a quarter to half a Pint, sweated as above; besides which, they relish and expel Poison, and if made with Wine, comfort the Heart, expel Wind, and are good against Fainting and Sweating Fits.

XVII. The Powder of the Seed, Leaves and Roots. It may be given to a Drum for all the aforesaid Intention, and if it be made in an Elec-tyre with Clarified Honey, it causes Expelation of Vicious tough Flegm Ricking in the Stomach and Lungs, expels Wind, and relieves acid and acciden-aneous Humors which vilificate the Bowels.

XVIII. The Comps made of the Seed. They are made as Carway Comps, according to the Art of the Confectioner. They warm and comfort a cold Stomach, cause good Digestion, take away nauseousness and retell Vomiting.

XIX. The Compot. Applied to grow Wounds, it stops their Bloodling, dries, conditdives, and quickly heals them, more especially if the Wound was not yet Woffed with the Juice of the Herb or Root, and this it does even in Wounds of the Head, where there is no fracture of the Skull.

XX. The Spiritualk Tincture. It is Cordial, comforts the Heart, revives the Spirits, refresher Nature, warms the Stomach, Bowels and Womb, powerfully expels Wind, and is good against the Belly-ac, and gripings of the Guts. Dose half a Spoonful or more in a Glafs of Wine, especially if the Patient is Sick at Heart, or in any Fainting or Sweating Fit.

XXI. The Acid Tincture. It refuits the malig-ny and Poison of the Plague and all forts of Mag-ny and Peltential Fever, is good against the inghts of Vipers, Rattle-shakes, Mad Dogs, and other Venemous Creatures, strenthes the Stomach, casts a good Appetite and an excellent Digestion, and is a very potent Medication against Stones, Sand, Gravel, or Tartarous Ulcers in the Urinary parts, provokes Urine, allays Vapors, and relishes fits of the Mother. Dose for many Drops at a time as to give the Vehicle, Wine, Ale, Broth, &c, a pleasing acidity.

XXII. The Oily Tincture. It is strongly Diu-rectik, gives present ease in the Strangury, or plitting by Drops, breaks up Gravy Stones in the Reins or Bladder, and expels them, as also Sand, Gra-vel, &c. Dose from 15 to 30 Drops first drop into Sugar, and then mixt with Wine.

XXIII. The Salte Tincture. It has the Virtues of the Oily Tincture, but is for the most part
Scabious Field Common.

and borne of leaves for a good space. And round heads of flowers, of a Pale bruish color, many set together in a head or knob, the outermost of which are larger than those inward, with many threads also in the middle, something flat at the top, and not fo round or Globe like, as are the heads of some other sorts.

Scabious Field lesser.

Chap. DCXXVI.

Of SCABIOUS, OR, SCAB-WORT.

I. The Name. This was a Plant unknown to the Grecians, but Matthiolus in his Epitome calleth the lesser Species of it, as which is as much as to say Scurf-Wort; in Latin it is called Scabies, and in English Scabious or Scab-Wort.

II. The Kinds. Authors have multiplied the Species to a great number, but we shall take notice only of such as are to be found growing Wild in England, or in our Gardens. viz. 1. Scabiosa Vulgaris, or Scurf-Wort, Scabious communis, Sel. officinarum, our Common Field Scabious. 2. Scabiosa minor, or Scurf-Wort, minor, Sel. officinarum, our Common Common Scabious. 3. Scabiosa major, or Scurf-Wort, major, Sel. officinarum, our Common Large Scabious. 4. Scabiosa alba, or Scurf-Wort, alba, Sel. officinarum, our Common White Scabious. 5. Scabiosa rubra, or Scurf-Wort, rubra, or rubra major, Sel. officinarum, our Common Red Scabious. 6. Scabiosa cornuta, or Scurf-Wort, cornuta, Sel. officinarum, our Common Corn Scabious. 7. Scabiosa montana, or Scurf-Wort, montana, Sel. officinarum, our Common Mountain Scabious. 8. Scabiosa alba, or Scurf-Wort, alba, Sel. officinarum, our Common White Scabious. 9. Scabiosa rubra, or Scurf-Wort, rubra, Sel. officinarum, our Common Red Scabious. 10. Scabiosa rubra, or Scurf-Wort, rubra, Sel. officinarum, our Common Red Scabious.

The Description.

III. The first or our Common Field Scabious. It has a Root which is great, white and thick, growing deep into the Earth, and abides many years. It grows up with many hairs, soft, stubby, green leaves, some of which are either not at all jagged, or divided on the edges, or very little, others are much jagged and torn on the sides, and have threads in them, which upon the breaking may be plainly seen, and are not in several of the other kinds: from among which rise up one or more round, hairy, green Stalks 5 or 6 feet high, with such hairy green leaves on them, but more deeply and finely divided, branched forth a little. At the tops of which, which are Nabed
Salmon's Herbal.

IV. The third, or Our Common Corn Scabious. Its Root runs not deep into the Ground, but rather creeps under the upper Grill of the Earth. It differs but little from the first before described, seeing that it is greater in all respects, the Leaves being longer, with greater Divisions and more whole leaves with them also. The Stalks are more slender and stronger, and the Flowers larger and more round, and not so deep or thrust together, but of the same bluish color, yet a little more declining to Purple.

VI. The fourth or Our smaller Sheep Scabious. The Root is like unto the other Field Scabious's but lefter. It has divers whitish green leaves at the ground, divided on both sides of the long pointed leaf, only into one Division, on each side, making every leaf seem like the small Sage leaf, called Sage of Virtue, which has small pieces of leaves like Bars on each side thereof, but a little dented about the ends. The Stalks are small and few, and are furnished likewise with such like Leaves, but feiler, and small bluevish Violets or Beads on them, like unto the other Field Scabious.

VII. The fifth, or the greater, or middle or hatty Sheep Scabious. This is greater than the former just now described, growing a foot high or better. Its Root is single, and like that of a Rampion

Scabious Garden small Common.

Scabious Sheepes Greater.

(vince Flibius Column refer'd it to the Rampion, its Seed and Milky Juice inducing him thereto.) It has slender rough Stalks or Branches, yet with leaves not so much divided, but only nick'd about the Edges. The Violets are in Color and Shape, like those of the last described, of a bluish color, containing of much Tenderer. They edge thrust together like a Button, not much unlike to that of the blew daisy.

VIII. The Sixth, or Our Common Scabious. Its Root is long and slender many years. It has long smooth Leaves below notched about the edges, but otherwise not much divided, nor form almost like a Sage Leaf, from among which rise up Stalk or Stalks almost two feet high, pretty stiff or strong, and branching themselves out, not losing their Beads downward. The leaves upon the Stalks are pretty large but...
Scabious Middle.

X. The Eighth or White Flower'd Scabious. Its Root is composed of a Number of slender Strings, foulced to the head thereof. It has many Leaves lying upon the Ground, very like unto Dvds but, but not so large, being hollow and jagged, not jagged about the Edges, of a light green color. (yet there is another of a dark green color, whose flower is of a deeper red) The Stalks have divers such like Leaves on them, (set by couples at the Joins) as grow below, and at the Tops small heads of Flowers each consisting of five Leaves, the biggest Flowers standing round about in the outer compass, as is usual almost in all kinds of Scabious, of a fine light purple or red color. After the flowers are past, comes the Seed, which is something long and round, set with certain hairs at the head thereof like unto a Star.

XII. The tenth, or Exotic or Indian Red flowered Scabious. Its Root is long and round, compassed with a great many small Strings, which perforate usually as soon as it has left its Flowers and Seed: otherwise if it does flower the first year of its sowing, if it be carefully defended from the Extremity of the Winter, it will flower the former the next year, as it has been often found (with us in England) by Experience. It has many large fair green Leaves lying on the Ground,

legend or cut in on both sides to the Middle Rib, every piece whereof is narrower than that at the end, which is the broadest. From a young which rise up several slender and weak Stalks, yet standing upright for the most part, set with smaller or more jagged leaves at certain distances, two or three at every joint, Branching forth at the top into other smaller Branches, bearing every one of them, a head of Flowers, like inform unto other Scabious's, but of an excellent deep red Crimson Color, (and sometimes more pale or dilated) having no Smell at all. After which come small roundish Seed, like unto the Field Scabious.

XIII. The Places. The first five, and seventh, grow in Faltures, Medows, and Corn Fields, and barren Sandy Grounds, almost every where, as Gerard saith, the other four are Nurs'd up in our Gardens, where they flourish very well. The first grows usually in most Medows in this Land, especially about London almost every where. The second grows likewise in some of the Dry-Fields about the City, but not so plentifully as the former. The third grows both in the Grounds where Corn is standing, and in such Grounds as have been formerly grown and now bye Fallow, as also in the borders of Fich like Fields. The fourth is found in many dry Gevvely and Heathly Grounds throughout almost all England. The fifth likewise grows also in such like places. The Sixth is not known where it grows wild, but with us it is Nurs'd up in Gardens. The seventh fort grows in Fields, and Medows. The eighth, ninth, and tenth, grow Wild in hotter Climates, but with us they are brought up in Gardens; yet the eighth has been often found growing in Medows, and Marthas near the Sea side, in several parts of England.

XIV. The Times. They all, except the last Hourly in the Summer Months, and Flower in June, and July, and abide flowering till it is late in August, and the Seed ripens in the mean time. The Ninth Flowers not until September or October, and sometimes is not apt to Flower with us the first year, so that many times it perisheth without bearing Seed, whereby we are oftentimes to seek for Seed from beyond Sea, to supply our selves with it again, unless great care be taken of it in the Winter time.

XV The Qualities. Scabious is said to be hot and dry in the end of the second Degree, and is of thin and fibular parts. It unites, attenuates or makes thin, digests, is Anodyne, Cofmetick, Venenous, Cardiack, Pectoral, and Alexipharmic.

XVI. The Specification. It is peculiar to cure all manner of Pultipes, Pimples, Scabs, Tersus, Ringworms, and other like breakings out. It prevents against Obliterations of the Lungs, Coughs, Colds, Wheezings, Pleurises, inward Ulcers, and Apophtems, and potentiely refills the Intention of the Plague or Pestilence, exterminating its malignity or Potion.

The Virtue.

XXVIII. The Juice. It is very effectual for Allhiurn's, Coughs, Cold, thirsts of Breath, Hoarseness, Wheezing, and all other Diffecles of the Breat and Lungs, opening and digestion cold Flegm, and other Vicious humors, exproterating them by Coughing and vomiting. Four Ounces of the Clarified Juice of Scorpions, taken in the morning fasting, with a Dram of Murtherade or Fever Tincture, frees the person from any Infection of Plague or Piffatice, you'll behold sorely fretted therewith, if after the taking of it, the patient Sneeze for two or three hour in their Bed, and it be repeated again, as the Phyfician may advise. Drink likewise to the quantity a foecful, it is good against Scab, and all manner of breakings out, as Tetters, Ringworms, Scorbutch Beils and Poffulles, yet tho' they proceed from the French Pox, which Matheros fays he has proved by Experience.

XIX. The Effence. It has all the Virtues of the Juice, but being stronger and more depaURED F_TILE, can only be given in a lighter quantity, as to 1 Ounces, in some proper Vehicle, as its own diifilled water, or the fame water mix'd with half as much Wine, and it ought to be taken morning and night fo long as need requires.

XX. The Decotion or Infufion in Wine or Water. It is made of the whole Plant, Roots and all. If mixed with an equal quantity of the Juice or Effence, and fo taken, it has all the Virtues of the faid Preparations, besides which it ripens all forts of inward Apotions, cleanses inward Ulcers, heals inward Wounds, and Cures Pllatiferous, being drunk moring and night for fome days together. It is good againft Pains and Stitches in the fide, and taken for forty Days together, it is good to heal all forts of breakings out, Sores and Ulcers, proceeding from the French Pox. Outward the head being washed therewith warm, it cleancs it from Dandriff, Scurf, Morphew, Sores, Scabs, and the like.

XXI. The Syrup. It is generally made of the Juice with Honey or Sugar, and has all the Virtues of the faid Juice, but more particularly it is Spedickagainft Diffes of the Stomach and Lungs, curing their Diffes, and caufing an easy Expectoration. It hath been told, an old Praparator of Phyftic and Chirurgery, this Syrup is an excellent Cure for Ulcers in the lungs, cleaning, drying and healing them, and he that had cured feveral therewith, by drinking 2 or 3 tafbles thereof morning and night, and an ounce of Syrupick Red Wine, let it.

XXII. The Poudre. It has all the Virtues of the Juice and Efience: 3 Drams of the Poudre of the Roots taken for 6 or 7 Weeks together in Water Clarified with the Herb, is good agast all forts of breakings out proceeding from what causc forever, you though from the Foul Diffece it self.

XXIII. The Balm or Ointment. They are excellent againft Scurf, Morphew, Dandriff, Poffulles, Ring-worms, Tetters, Scabs, and all other Cuticular Defeafes, being anointed upon the parts affected morning and night. They alfo being dip't herein heat not onlj' Green Wounds, but likewise Old Sores and running Ulcers. They help all forts of cold and hard fwellings in any part, and are effectual to restore contracted or thrum up Sins, at not vo long fanding.

XXIV. The Cyphonial. It is made of the Juice mixed with Gopher made into Powder, with a little Spirit of Wine, and Powder of Barox. It cleanses the Face and other parts of the Skin from Freckles, Tanning, Sunburning, and other diflaffosions, Mophrew, Lepraphes, Pimpcles, Scab Indians, and other like breakings out.

XXV. The Cataplasm of the Green Herb. Applied to a Carbuncle or Plague Soare. It has been found by Experience, to diflaff or mute out, and break it in fome time. It diflaffs cold and hard Tumors, and being applied does in a fhort time brocken and drew forth any Splinter, Thorn, broken Bone, or other like things, which may stick, and lye in the fhell.

XXVI. The Stippled Water. It has the Virtues of the Juice, Efficace, Diflaffion or Infufion, but nothing near fo powerful as they be, and therefore may be taken a quart or half a Pint at a time, fweetened with the Syrup of the Herb, but it is mod eflicient to take it.

XXVII. The Spirituous Tincture. It is Alexis-pharmucrnic, refills Poifon, strengthens the Heart, revives the Spirits, and confounds the Universal frame of the Body. Dofe 2 Drams, mixt with fome of the Syrup.

XXVIII. The Acid Tincture. It pervails againft the Poison of Venomous Creatures, Bittings of Mad Dogs, the malignity of the Plague or Piffatice, and all forts of Malign and Pestilential Poisons; it is a fuggarful thing also againft Allhiurn's, Coughs, and all other Diffes of the Breat and Lungs, proceeding from Oldniitions, Cold, Bows, and the like. It refills Vomiting, Efficace, and strengthens the Stomach, and caufes a good Appetite, and a strong Difgitation. Dofe fom to a time as to make the Drink, Wine, Liquor, or Vehicle gratefully pleafant.

XXIX. The Saline Tincture. It is chiefly used in all Diflaffations of the Skin, alfo the acrid and acid humors, cleaning, drying, and healing the fame, and eflicient into the Skin to its peripheal Smuchoods, Softfads, Whitens, and Beauty, by only Rathing therewith Morning and Night.

SCALLIONS, for Oiions, Chap. 572.  
SCARIOLE, use. Endivee. Chap. 244.  

CHAP. DCXXVII.

OF SCORPION HERB.

CATERPILLARS.

THE Names. This it fearely appears whether the Ancient Greeks knew any thing of this Plant, yet our Modern Herbifts have given it the Greek Name, Sappheira, in Latin, Scorpinides; and in English, Scorpion Herb, Scorpion Grafs, and Caterpiller.

II. The Kinds. There are various forts of this Plant, viz. 1. Scorpinides major, Scorpinides bucciferus major, the great Scorpion Grafs, or rough Caterpiller. 2. Scorpinides minor, Scorpinides bucciferus minor, the leffer Scorpion Grafs or Caterpiller 3. Scorpinides bucciferus pilorum Corniculis.
The Descriptions:

III. The fifth or gross Scorpion Grafs, or rough Caterpillars. Its Roots are small and fibrous, pe-

riphing every Year. It is but a small low Plant, with Branches lying upon the Ground, which have

frequently long, broad and hard Leaves growing thereon, from among which come forth small Stalks,

bearing at their ends for the most part, two small pale yellowish Flowers, like unto Taras or Vetches,

but smaller, which turn into Whitish or Crooked rough

Cods, pretty thick, round, and white, and not so

much turn'd or wound together as those of the smaller

next following, in which are contained broonish

yellow Seed, much like unto a Medice.

IV. The second, or lesser Scorpion Gras, or leffer Caterpillars. This in its Roots, Branches,

Leaves, Stalks, Flowers and Seed, is much like the

former, saving, that it is every way less; but in

this the Cods are more Whitish or Crooked, much

smaller, and rounder, and more usual and turned

together than those of the greater, yet not cliing

like unto Smalls, but blacker and more like unto a

Caterpillar than the former.

V. The third, or small ordinary Caterpillars with

many Cods. Its Root is Annual and very Stringy.

This small Caterpillar grows in the same manner

with trailing long Branches as the fl small rough
fort does. The Leaves are likewise of a fresh green

Color, and of the same fashion, but somewhat leffer.

The Flowers also have a deep yellow, or four or five oftimes joining together, which are of the same

tenderness and fashion with the other, ad-

ly that has as many Crooked Cods together as there

are Flowers.

VI. The fourth or finest Coddod small Cater-

pillars. This is in all things like the former fort, fattying that it has seldom two Flowers together on a

Stalk, and the Caterpillars which follow as frien,

being Crooked and Winding in the very same manner,

and small and smooth without any roughness at all

upon them, and of the same pale brown Color.

VII. The fifth or Matthias his Scorpion Gras

with Purlfame like Leaves. Its Root is long and

Vibrissa perishing Early. It has several upright pale

green Stalks, with pale green Leaves for theron

each of which is something long, broad, and round

pointed, like a Purlfame Leaf, sometimes having two

small Leaves joined together at the bottom of the

greater, and oftentimes in many without them. At

the Tops of the Stalks, and out at the joints like

wise, come forth small pale yellow Flowers, much

resembling those of Medica or Small Cluster Grafs.

After which follow small long slender and Crooked

Horns, small at the end, jointed or parted as it were, all the length of it, something resembling the

long Crooked Cods of the Common Scorpions,

but that this is more coherently jointed, and of a

pale Color, within which are small long white

yellow Seed.

VIII. This fifth kind, because it has some refer-

bance of Purlfame, and therefore called by some Scor-

piones Leguminis, or Gerard says, is by him thus
described. It has small and tender Roots like small

Tineads. It has many Branches, weak and tender

Trailing upon the Ground, if there is nothing for

it to take hold of with its Cleading and-Crooked

Seed Vessels, otherwise it rampeth upon whatever

is near unto it. Its Leaves are few and small, and

the Flowers very little, and yellow of Color. And

the Seed follows little and blackish, contained

in little Cods like unto a Scorpions Tail.

IX. The sixth or Water Scorpion Grafs. This

grows in almost every standing gently running

Stream, having Leaves like unto Broonlame. The

Flowers grow at the Top of tender first green Stalks,

of a Breev color, and sometimes with a spot of yellow

among the same, and the whole Branch of Flowers

does turn it self rou'd like a Scorpion Tail. There

is another species of this Water Plant, which has

Leaves like unto Amusia aquatica, or Water Chick-

need, having like slender Stalks and Branches at

the forewa, and the Flowers not unlike, wanting that

they are of a Watchet or light annex Color, something

bigger and loud more open, whereby the yellow

foot is seen.

X. The seventhly, or Mossy Ear Scorpion Grafs.

It has a Root which consists of a Breev or small

Vine or Stringers. It has rough and barmy Leaves of

an Over grown yellow Color. The Flowers grow upon

much flacque rough Branches, as it is all the rest of

the Plant. And they grow likewise for the most part

on one side of the Stalk of a brown Color, with a little

spot of yellow on the same, turning themselfe round

backwards, not much unlike the Tail of a Scorpion.

There is another sort of this species, much like the

above decribed, called Myopshlos Scorpiones repens,

in which the Flowers are thicker throug together, and

do not Grow all upon one side as the former do.

1027

Chap. 627. English Herbs.
The Virtues.

XVI. The Juice of the Herb. Drank to the quantity of 3 or 4 Ounces, it is good against the biting of Serpents, or other Venomous Beasts, being repeated Morning and Evening, so long as need requires.

XVII. The Decoction in Wine. It has the same Virtues, and may be taken half a Pint or more, Morning and Night.

XVIII. The Ointment. It is made of the Juice or green Herb, with Oil, Wax, and a proportionall quantity of Gum Elewnt. It is good to diffusse Simple Contusions, and to heal green Wounds being appleyed.

XIX. The Cataplasm. It is made of the green Leaves being beaten in a Marble or Wooden Mortar. Being applied upon the place hurt, it is said to be a present Remedy against the Hissing of Scorpions.

CHAP. DCXXVIII.

OF SGRVY GRASS: OR,

SPOON-WORT.

I. THE Names. This Plant was unknown to the Ancient Greeks and Latins; but our Moderns have called it Cochlearia (from the form of its Leaf) and in English Scurry Grass and Spoon-wort.

II. The Kinde. There are several Species of this Plant; but these three following are chief.

1. Cochlearia Vulgaris, Cochlearia Marina, Cochle-
ria Anglica, or Sea Scurvy Grass, is, Our Com-
mon or English Scurvy Grass. 2. Cochlearia ro-
undifolia Cochlearia bortenfis, Cochlearia Belgica, 
Telesphonic Lacinia, Cochlearia rondifolia major, 
Our Great Garden or Dutch Scurvy Grass. 3. Co-
chlearia rondifolia minor, Small Dutch Scurvy 
Grass.

The Descrisions.

III. The first, Or Sea Scurvy Grass, Or Our Com-
mon or English Scurvy Grass. It has a short 
thick Root, replenished with a great many Fibers, 
even to a Bough as it were of White Strings, which Stick 
deep in the Mud, in which it chiefly delights to 
grow, yet it will flourish very well in the more 
upland and dryer grounds, Telling a little Brackish 
ever there, though nothing so much as where it 
has the Salt Water to nourish it. It has many 
black thick for Leaves more long than broad, and some-
times longer and narrower, sometimes also smooth 
on the edges, and at other times a little Waved, 
for in all these forms it is to be seen, as also 
plain, smooth, and pointed, and sometimes a little 
blunted in the middle and round pointed, of a 
red green color, and sometimes a little brownish, 
every Leaf standing by its self, upon a long foot 
Stalk, which is greenish or brownish also, from 
among which Leaves, ris up small slender Stalks, 
being a few Leaves thereon like the other, but 
longer and luster for the most part. At the Top 
whereby grow many whitish flowers, with yellow 
Treads in the middle, standing about a green head, 
which becomes the Seed Vessel, and will be some-
what
Scorbutic Gras’s Garden or Dutch.

Scorbutic bellowmake, or being in the middle, every one of them standing also upon a long[1] foot Stalk. From among these rise up divers long, slender, weak Stalks, higher than the former, and with a greater store of small white Flowers, at their Tops, which convert into smaller Pads, and furnish bowerous Seeds than the former. The Kelle of this Plant is not Salt or brackish at all, but has an hot Aromaticke Taste almost like Spicke.

V. The third, Or small Dutch Scorbutic Gras. Its Root is very small, consisting of a few Tubers, which perish as soon as it has perfus’d its Seed. It grows like the last, with many small, roundish Leaves, sometimes a little Crumpled at the edges, not bigger than the Nail of one little Finger, every one growing upon its own foot Stalk, which abide all the Winter, if it is Soon before Winter, or that it is rife up of its own Spontaneity; otherwise, if it is Soon in the Spring, it flows forth divers long, slender Stalks lying on the Ground, a foot long or better, on which grow such like small round leaves, very thinly set, up to their Tops, whereas do grow many small White Flowers, like to the last, but much smaller, according to the proportion of the Plants, with small Seed answerable thereunto. This will springing up again, if the Seed be suffer’d to fall, or how it self, in the same place, towards the latter end of Summer, or before Winter, & do what you can always, if you will gather any ripe Seed thereof, there will be some of it found, before you can gather, is.

VI. The Places. The first grows along the Thames-side, on both the Ridges and Kettle-behes, from Wooton, where the Water begins to be Salish, round about the Sea Coast to Dover, and also from Dover round about the Coast to Portsmouth, and even to Brighton, where it is to be had in great plenty. It has not been ob- served yet to grow on our Northern shores, but on many other places on the Wether Coast. The second, or our Garden Scorbutic Gras, grows in the Marshes in Holland in Lincolnshire, and in many places thereabout by the Sea side. It grows by the Sea side at Hull, at Boston, and at Lynn in Norfolk, and in several places in Lin- colnhire, as in Whaplode, and Holbeck Marshes in the same County. It has been found of late, growing many Miles from the Sea side, as upon a great Hill in Lincolnshire called Legbyth or Hill, (one of the highest Hills in England,) but indeed it will grow in any Soil, Place, or Climate whatsoever. It is said to grow also near to a Cliff in the Peak in Derbyshire, full 30 Miles from the Sea; but it is now Sown in most Gardens (for its usefulnes) throughout the Kingdom, it will grow in Moist and Cold shadowy places, and yet will prosper very well in the Sun also; and in many upland Countries of this Land, it is Sown in great Quantities, not only for the peoples own spending, but to fall to others for Profits: And in our Gardens it flourishes, and bring forths its Seed, as Naturally as by the Sea side, and retains the same hot and Spicy Tattle, which thers that it re- futes no place of growing, as many other Maritime Plants will. The third grows in the Land- Countries, but prospers well enough in our Gar- dens, if Planted or Sown therein.

VII. The Times. They all Flower early in the Year, as in April, and many times in May, and their Seed is ripe not long after, as in June, and the latter end of May.

VIII. The Qualities. It is hot and dry in the fourth degree, plentifully wrought with a Mercurial Volatilte Spirit, and both a Volatile and first Salts, whereby it becomes Appetitive, Alleviative, Attrac- tive, Cofmetick, Digestive, Defervit, and Digesti- tive, Stomackick, Pectoral, Hepaticke, Spleenick, and Hyfrenick; Emmu-margicks, Sudorick, and Spleenick.

IX. The Specification. It is peculiar for curing the Scorbut in a cold habit of body, with all its symptoms, it opens obstructions of the Liver, Spleen and Womb, Cures the Palsy, and all forms of Sores and Ulcers in the Mouth, and cleanses the Skin of Spots, Scorbut, Morphever, and other like defilements thereof.

X. The Preparations. You may make them from 1. A Liquor Juice or Efficace. 2. A Diet Drink. 3. An Infection or Decrement in Wine or Water. 4. A Concoction. 5. A Tincture. 6. A Distilled Water. 7. A simple Spirit. 8. A purging Spirit. 9. A fixed Salt. Where Note, that the Garden Scorbutic Gras is the strongest and most efficial to the purposes intended and that which is most used.

The
The Virtues.

XI. The Liquid Juice or EFFENCE. It may be taken from one to two Spoonsfulls or more, every morning Morning, to be taken in a Glass of Ale, Beer, or Wine, for the Cure of the Scourvy; it cleanses the blood, open all obstructions of the Liver, spleen, and womb, renews, warms, and comforts the stomach, creates a good Appetite and Digestion is good against Scurvy, and takes away the Swelling, Pains, and hardness of the spleen, and is profitable for such as are subject to, or troubled with, Bitches, Bells, Scurvy, Murrain, or other distempers, from the Corruption or Putrefaction of the blood.

XII. The Diet Drink. Take Juice of Garden Scourvy Grafs five Ounces, Juice of Angelica, a Pint; Barberry Roots, half a Pound; hops, hops, or Quinces, all bruised, or thin freeze: Attrived Seed bruised, Coriander Seed bruised, of each a Quarter; Cloves bruised, Nutmegs thin sliced, of each half an Ounce: Yellow of Orange Peels, cleared from the White 3 Ounces: Choice Sevens, 2 Ounces: New Ale Ten Quarts. Put the Juices first into the Ale, and then put all the other Ingredients into a long close Knot Bag, with a Stone in it, which put also into the Ale. Let them work together, and after two days let the Extract drink of it, a Pint (or less according to Circumstances) at a time Morning and Evening. Squeezing into every Draught as is Drink the Juice of a Scurvy or Sour Orange. The Recipe may be repeated with fresh Ingredients, 3 or 4 times Spring and Fall, according as necessity may require. It has all the Virtues of the Juice and Effence aforesaid, and is a most excellent thing to cleanse the Blood of all its defecations, which it many times manifestly various sorts of breakings out in the Flesh and Skin.

XIII. The Inflation or Defecation. They may be made in Wine or Water, or in half Wine, half Water, but made with White Port or Lisbon Wines they are best. They have the Virtues of the Juice or Effence, but not altogether so powerful, but are good for the Cure of the Scourvy in a cold Contagion. If the Spirit is to be Decoction, it is to be mixed with an equal part of the Juice or Effence, and then very well sweetened with Honey, with a most excellent Nux vomica for the healing of Sore Mouths and Throats, and cutting off the Scourvy in the Mouth and Gums.

XIV. The Concoction. It is made of the round or Garden Kind (which is much the more preferable for) according to the usual Method. It is a delicate Medicine for weak and tender Stomachs, and for such as are out-run with the Scourvy, and are apt to be sick in a Morning, or after Eating, or cannot digest their Food: it causes a good Appetite, and has all the Virtues of the Juice and Effence aforesaid.

XV. The Infusion. It is made of the Green Herb, by distilling it in Spirit of Wine, either simple or acerate with Spirit of Salt or Sulphur. It is a potent thing against the Scourvy in a cold Contagion, as also for the Cure of the Pallas, and relieving of Paralytic Members. It gives ease in the pains of the Stomach, Liver, and Spleen, and in the Cokick proceeding from Wind and sharp Humes. Dose half a Spoonful to a Spoonfull in a Glass of Wine, or Wine mixed with Water, morning and night, or upon point of Extremity.

XVI. The Diluted Water. Take Garden Scourvy Grafs ten Pounds: Hops Rakish Roots cut into thin slices 6 Pounds: Fair Water 3 Gallons: so leave warm for Twenty Four Hours, then draw off 2 Gallons of Water, Bane’s Phærum. This ought to have a different Distillation from that of Stomachick; for as Scoury Grafs, &c. abound with more volatile Spirits, and more volatile Solids, to fit its admiss of lea Fermentation, and therefore ought not to have part of them or aforesaid if stronger than Water, as Perry, Made, not found or hard, &c. which may affect, distil, and join with the Effential parts of the Ingredients, and keep it in Diluition, without changing their Natures and Virtues. It is essentially good against the Scurvy, Dropsy, Gout and Stone, or any Taurous Concretions in the Reins and Bladder also against the Cokick, Rhexia, and other like general distempers, which hardly admit of any irregular Name or Denomination. Dose one Ounce or more in a Glass of Water, morning and night.
Spirit of Scurvy Gras. But Respiratory dislikes this way by Insufflation, and makes it thus: Take fresh Garden Scurvy Gras as much as you please, bruise it grysly, gently and speedily, add to it Generous White Wine and fermenting it be freshened, by which means there is much of the Volatile Spirit left) and draw off the Spirit in an Alkemeh according to Art, separating the Oil, if any be found Separating. The Spirit he Exhibits in any proper Vehicle. The Oil be mixes with Sugar and makes thereof an Elixir-faccharum Cabacharice, which may be given in small Doses and in a proper Vehicle for the same purposes for which the Spirit is given, but they are only to be administered to people of a Cold and Moist Constitution, in a hot habitation of Body, they will put all into a Flame.

XIX. The true way of making this simple Spirit.
Take the Leaves and Flowers of Garden Scurvy Gras, as much as you please, bruise them, and make them up into Balls (this style of Weed, which dyeth all) or being Braised, put it into an Earthen Jar, pressing it in, upon which offsets strong Scurvy Gras Water, or rather, Scurvy Gras Wine, made of the Juice of Scurvy Gras to which alone infusor four or five Weeks, add all with a Cork, and late it firmly for three or four days, then put all into an Alkemeh with its Head and Worm, driving off the Spirit, and there the Water according to Art: which redify in a Glass Cazareus, so full the pure Subtil and Volatile Spirit ascends first, which keep it self in a Glass Stopper. The remaining Water you may draw off to dyspepsia, to make fresh Spirit with all. The Dose of any of these are from 20, to 30, 40, or 50 Drops (as Circumstances and necessity may require) for the Cure of a Cold Sweating, Foulness, Tremblings, Numbness of the Limbs, Debility, Cachexia, &c; having all the Virtues of the former Simple Spirit and Water at Sect. XVI. and XVII. foregoing.

XX. The Purging Spirit. Or Golden Spirit of Scurvy Gras so called. Take of the leaf Spirit of Wine 24 Pounds, fresh Garden Scurvy Gras 25. of which as much as may fill the Spirit: digest twelve hours, and then distill off the one half. With this Spirit and the Caper of Scurvy Gras, and three Drops of Jupiter (extracting the Tincture and filtering) you may prepare Spiritum Calceusis purgantum, the Purging Spirit of Scurvy Gras. Or thus Take of some of the former Simple Spirit of Scurvy Gras 4 Ounces, Powder of Sequinomy for Ounces, or in place thereof Powder of Jalap 9 or 10 Ounces, digest in a warm dish only, or in a very gentle Baine, in a large dish, so long till you see the Tincture grow very Red, which decant and keep for use. It is highly Antiferment, Antiparalytic, Antihemorrh. Spleenetick, and Diaphoreptic, making fat and crude humors Volatile, and reviving purifica-

The Descriptions.

I. The Names. This Plant was generally un-
known to the Ancient Greek and Latin Authors; but our Modern writers call it Prunella, from the German Name Brunnella, or Brunellen, because it cure that Disease which they call die Braun, which is an Inflammation in the Mouth, Throat, and Tongue, with blackness therein, accompanied for the most part with a Burning Fe-
ver, common to Soldiers in Camps and Garrisons. It is also called Conflidos minor, and Salivas minor, Conflidos minus Camerarij, in English Self-
Heal.

II. The Kinds. There are several Species of this Plant, but those which are to be found with us are these three, viz. 1. Prunella vulgaris fragilis, Brunella Brunelli, Dodonae, or Lobelia, Our common Self-Heal. 2. Prunella vulgaris flore al-
bo, Self-Heal with a White Flower. 3. Prunella lucinata floe Bawhini, Symphytum petere Lobehej, Self-Heal with Jagged Leaves.
Self-Heal, or Prunella.

which spread sometimes into Branches, with divers such small Leaves set thereon, up to the Topy, where faint brown sphered heads, of many small brownish Leaves like scales, and flowers set together, almost like the heads of Stachas or Calidones, which flowers are gaping and of a blent purple, or more pale blue color, and in some places faceting flowers that not so in some others.

IV. The second, or Self-Heal with a White Flower. This differs little or nothing from the former, neither in its Root, Stalk, Leaves, Branches, Flowers, Seeds, Magnitude, nor in its manner and form of growing, fasting, that in this the small scales of Leaves are not brown, but green, the flowers is of a pure white color, and it increaseth or spreads not so much.

V. The third, or fagged Leav'd Self-Heal. The Root is long with many Fibres or Stringes, and engraves by the shooting of its stumps, which forth fresh Leaves every Year. The Stalks are likewise square and hairy, as the Leaves are, which grow thereon, by couples at the joints, the lower of which are long and whole, without any cut or jag in them, all the rest being longer and narrower, are cut or jagged on the sides, and the higher leaves more divided or Cut. The heads are like those of the first common sort, and of the same form and magnitude, but varying in color as the former sorts do, for some plants are found with purplish flowers, others more dilated, like blue, some between blue and white, like an Ash color, and others all together White.

VI. The Places. The fift and second found are in Woods and Fields evcry where almost throughout all England. The third grows naturally upon Rocks, Stoney Mountains and Gravelly Grounds, and is found also on many Hills and Mountainous Places in several Parts of France and Germany.
Ple Contusions, Pains, Æthes, Sore Ucers, whether New or Old, reprefpes defluxions of humors, as also their heat and Sharpnefs, flowing to any part, abumes the Infiamation, and prevents a Gangrene, whereby it perfently refores the parts to their Prifine health.

C H A P. DCXXX.

OF SHEPHERDS NEEDLE.

I. THE Name. It is called in Greek 3ekhla, in Latin, Scandix, alio and Acus Veneris; Acus Polllorte, Pellen Veneris, Acacul, and Scanaria; and in English, Shepherds Needle and Venus Comb.

The Description.

III. The firft, or our Common Shepherds Needle. Its Root is very small and Fibrous or Thready. It ripes up with feveral long, hard, large, green Stalks of Leaves, much divided, and into more parts, and of a lighter brown green color, than Cherrel, having no flmall. The Stalks grow a foot high, bearing fmall Tufts of white Flowers, and after them fome or fome, more or few, of long Seeds, something round, and pointed at the ends, a little rough as if they were dented, and all of them coming from one Head, or Umbel, with a few small Leaves under them.

IV. Gerard says, Its Root is white and of a fingers length; but it does not much differ in the Quantity of the Stalks, Leaves and Flowers, from Cherrel, but has no fuch pleafant flmall as that has; the Leaves are lefter, more finely cut, and of a brown green color. The Flowers grow at the tops of the Stalks in small white Tufts, after which come up long Seeds very like unto Park-Needles, and orderly one by another like the great Teeth of a Comb, from whence come the Name Pefon Veneris, Venus Comb, or Venus Needle.

V. The second, or small Shepherds Needle. Its Root is small, long and white. It has feveral Stalks of very fine cut leaves, not bafhing thick like the former, but more fpreaded and thin, coming something near to Camomel, but finer, and a little fteer, of a pleafant fmal and fapple, from among which rife up fonder flmall Stalks, fomewhat hairy or hairy, with but few flets or Leaves on them, at the tops of which fand five or fix small white flowers chiefly fett toge ther, confifing of five Leaves apiece: in the middle whereof is a dark purpliff Fife or leaf longer than the reft. a spreading florf like a paling flar, after which follow long Seeds, like the former, but fmaller, bigger below, and ending a bow in two small points, whose edges are more rough, and from more dented, and are a little Purpliff, as the young ones are, before they be ripe, which are the Seeds themfelves. This has been obferved to have a better flmall growing in void, until i?id and gravelly Ground, than that which grows in the fields.

VI. Gerard, describes it thus, from a long, fперед, and fubflift Root, it fends up many small Leaves, like thofe of the former, but of a pleafant fmal and feafe, something like that of the

Shepherd's Needle or Venus Comb.
Salmon's Herbal.

lib. 1.

The Virtues.

XIV. The Liquid Juice or Essences. They are good for the Stomach, Liver, Spleen, Bowels, Reins, Bladder, and Womb. They provoke Urine admirably, increase Seed and Lute, and free the Viscera from Obstructions, being profitable also against the Colic. Dose: 2 or 4 Spoonfuls in a Glass of Generous Wine, or some other Vehicle.

XV. The Decoction in Wine or Water. It has the Virtues of the Juice or Essence, but being much weaker, must be given in a great deal larger quantity, as from a quarter of a Pint to half a Pint, morning and night, a little firstened with white Sugar.

XVI. The Powder of the Seed. It is affolent, hops Fluxes of the Bowels, and taken with Vinegar, it presently hops the Heart, and mixed with Hops, Land and Sheep's Suet in equal Quantities, it is said to Cure BURNING with Fire.

XVII. The Salts of the fecond kind. It breaks Seed, provokes Urine, and excites to Villain; yet is said to relieve such persons as are spent therein, or weakened thereby: and by cleansing the Womb, opening its obstructions, and strengthening the seminal parts, it is said to cure barrenness, and ease Conception. And all these things do the Liquid Juice or Essence do, in a more admirable manner, being daily taken.

XVIII. The Caftigation of the Root. It draws forth the fire in places burnt or scalded: and being applied to parts having Thorns, Pricks, Splinters, or other like matters gotten into the flesh, it draws them forth.

CHAP. DCXXXI.

Of SHEPHERDS PURSE.

I. The Name. This Plant was unknown to the Greeks, at leastwise it has no Greek Name that we know of; but it is called in Latin, Burfo Pofforis, and Pera Pofforis, by Callo Darantons, Herba Cancri, and by Gemon, Thalpsis faunane; and by us in English, Shepherds Porse, and Shepherds Pouch; and in the North parts of England, Top-sorte, Pick-Purse, and Cafe-need.

II. The Kinds. We have growing with us, 1. Burfo Pofforis major vulgaris, Our greatest common Shepherds Purse. 2. Burfo Pofforis minor, Our small Shepherds Purse. 3. Burfo Pofforis minor fesseh non sannus, Great Shepherds Purse with underridden or whole Leaves.

III. The fift. Or our Common Greater Shepherds Purse. Its Root is small and white, with some Fibres annexed to it, and surpasses after Seed in the foliages of the Seed. It springs forth with several small and long Leaves, something deep sawed or split.
The Virtues.

XL. The Juice. Drop into Sore or running Ears, it dries and heals them. Drink to purify the Blood, or to stor or running Ears, it dries and heals them. Drink to purify the Blood, or to stor or running Ears, it dries and heals them. Drink to purify the Blood, or to stor or running Ears, it dries and heals them. Drink to purify the Blood, or to stor or running Ears, it dries and heals them. Drink to purify the Blood, or to stor or running Ears, it dries and heals them. Drink to purify the Blood, or to stor or running Ears, it dries and heals them. Drink to purify the Blood, or to stor or running Ears, it dries and heals them. Drink to purify the Blood, or to stor or running Ears, it dries and heals them. Drink to purify the Blood, or to

XII. The Essence. It has all the former virtues with advantage, and singular for healing the Bloody Flux, and Contagiating the Lips of Green Wounds. And being mixed with a third part of Juice of Plantain, is powerfully suppurates, the overflowing of the Loches, as also of the Terms in Women. Dose 3 or 4 Spoonfuls morning and night in a Glass to the decay of made in Smiths Forge Water.

XIII. The Decoction. It may be made in Strychnbine Water, or rather in Smiths Forge Water, adding after the Healing a quarter part of the old Strychnbine Water. It has all the Virtues of the Juice and Essence, being taken morning and night, 6 or 8 Ounces at a time, either alone or to tincture with the Glory thereof, is good also to heal inward Wounds, and Ruptures in Children.
Salmon's Herbal. Lib. 1

XIV. The Syrop. It has the Virtues of the Juice, Essence and Decotion, but not so powerful as they; and is fit to be given to Children in all those cases; as also to sweep thee several preparations, to make them more palatable, and clear to be swallowed. It is made of the Clarified Juice, with its equal quantity of Clarified Honey or double refined Sugar, if it be not for long keeping; otherwise, it requires double quantity, &c.

XV. The Balsam or Ointment. They are Active, drying and healing, admirable for the Curing of simple Green Wounds, and that upon the spot, in what part of the Body they are applied also to parts overtrained, or where there is any weakness, it strengthens them, and restores them to their former Strength.

XVI. The Colphies. Being laid upon Anthrax Fire, or other Inflammations, it cools, and repulses them, very much refreshing the parts; Applied (pretty hard bound on) to the Wrists, and Sides of the Face, it is said to help the Yellow Jaundice, but how true this last is, I cannot tell, for I never tried it. It is made of the Green Herb cut, and beaten in a Mortar.

CHAP. DCXXXII.

OF SHEPHERDS ROD.

I. THE Names. It has no known Greek Name; but is called in Latin, Virga Palforis; and in English, Shepherds Rod, or Shepherds Staff.

II. The Kinds. Authors account it to be a Species of the Diffusa Sylvestris, or Wild Tewfle. Bauhinus calls the Diffusa Sylvestris, or common Wild Tewfle, Virga Palforis Major, and this, Our Shepherds Rod, Virga Palforis minor, which is thought to be the Galeagron Pinus, Lib. 27. Cap. 10. and the Diffusa Sylvestrium Canaderry.

The Descriptions.

III. It has a Root which is long, branchlet cut, and furnished with several Fibres or Strings. Its Leaves are large, denser about the Edges, and of a sad green color, a little prickly on the back, but not so prickly as the Wild Tewfle. The Stalks grow higher but not with such large Frickles, and the Leaves are set by Couples at the Joints, but not encompassing the Stalk so as to hold water, as the Tewfle do. The Stalk and several Branches bear at their Tops, small heads, no much bigger than Walnuts, with short Frickles thereon, and blith colored Flowers, much like to those of the Wild Tewfle. The Stalk cleared from its Frickles, Shepherds formerly made use of to hold in their hands to guide their Sheep, whither whence came the Name of Virga Palforis, or Shepherds Rod, or Staff.

IV. In Gerard it is described thus. It is a kind of Wild Tewfle, and reckoned among the Thistles, but growing higher than that, but much like it, saving that its knobbled Leaves are no bigger than a Nailine. Its lower Leaves are deeply cut in with one Gath, on each file, at the bottom of the Leaf, which make them to have (as it were,) little Ears.

which the Catter has carelessly omitted in the Figure. The Leaves also are less than those of the Wild Tewfle, narrower at their setting on, and water at the other does, the whole Plant being leaf. But Bauhinus says, it grows from a Cubit high.

V. The Places. It grows in many places thro' the Kingdom, which are moist, and in moist high ways; as in the high way leading from Bramtree to Hemmingham-Castle in Eifre; and here and there in the high way from Black-Dunmore to London. It has been found growing also in great plenty at Edreebey by Croyden, in several Places thereabouts.

VI. The Times. It flowers for the most part in July, and the Seed is ripe in August, or not long after the flowering.

VII. As to Its Qualities, Specification, Preparations and Virtues. Authors have said nothing, yet it is supposed to have the same Virtues as the Common Wild Tewfle. And the Distilled water thereof is commended to be drank after eating by Women who have a depraved Appetite.

CHAP. DCXXXIII.

OF SKIRRET.

I. THE Names. It is called in Arabick, Frarum, or Seficorn, in Greek, Simeon, in Latin, Sifarum, or Siffer- in English Skirret.

II. The Kinds. There are but two kinds generally taken notice of by Authors, viz. 1. Simeon
Chap. 633. English Herbs.

UngUjh has all Cubit Secacul. The by that bunched eaten Con/; or as fays, was long as Winged but Llmbels Englilh be and neither ftrong like Pliny a rife and for they not and to round, has Skirret Greek Sifer is alfo, more after were middle one nor & tough Seed Germany. Caufted this it about Germany, Columna and some others took this plant to be the Elagabalus Dioecridas, but they were deceived, for this Her is neither Fabulous, nor has it Umbes of Yellow Flowers, nor Seed like the Parthen, but it has white flowers, and Seed like Parly. Pliny his Sifer, which is all one with the Sifarum Dioecridas, has a strong tough ftring, almoft Woody, running through the middle of each Root, which is to be taken away after the boiling, that they may be eaten with the more pleafure, which this Our Common Skirret has alfo, and which no other Root, that was then, or is now edible, has besides, for which alone rafton there is no doubt but this Our Skirret is the true Sifer, or Siferum of the Ancients. 2. The other is called by the Arabians, as feralas, Scecalis, in Greek Χειρος ζυγον, in Latinio; Sifarum Sylocre, Sifer alterum, Sifer Syricum; in English Wild Skirret, and White Carrot. Rauwolfius fays that this grows in Egypt, and is there called allo Sc- 

cal, by the Arabick Name.

The Descriptions.

III. The Firft, Or Our Common Skirret. It has a Root which is compofed of feveral small, long, round, white Roots, fet together at one head, like to Asphodel; bunched out or uncore in many places, and ragged, or as it were wrinkled within, and not fmoother, as divers other Roots are, each of which has a small tough Path within them, which being removed, the root is very pleafant to be eaten. From the head of these Roots, rife up feveral Stalks of Winged Leaves, fomething like to thofe of the Parthen, but that they are fmoother, and fett farther afarand, fmaller, and greener, and alfo dented about the edges. From among which rife up the Stalk, little more than half the height of the Parthen, having at the Top, Umbels of White Flowers, which afterwards turn into small dark Seed, fomething larger than Parthen Seed.

IV. Gerard defcribes this Plant after this manner. The Bools are many in number, growing out of one head, an hand breadth long, and moft commonly not a finger thick; they are fweet, white, good to be eaten, and pleafant in Taft. Its Leaves do con- 

fift of many small Leaves folded to one Rib, each particular one wherof, is fomething Nickered in the Edges, but they are fmoother, greener, and fmoother than thofe of the Parthen. The Stalks are fhort, and feldom a Cubit high. And the Flowers which grow in fpoaky Tafts, are white.

V. The fcond, or Wild Skirret. This has a long, tender and fmoother Root, growing on the out- 

side, and white within, as thick as one finger, and easy to be broken, and nine or ten INches, or almoft a foot long, baving feveral small knots or bunches thereon, like to Warts, of a pleafant fweet Taft.

Skirret Field or Wild.

Skirret Garden.

like unto our Carrots. From this Root rife up many Stalks of Winged Leaves, much divided and cut into many parts, not very unlike to Carrot Leaves. The Stalks have alfo feeds like Leaves at the joints, and Umbels of Flowers at the Tops, like unto them for form, but of a yellowifh color.

Parthen. This riffs grows at Narbonne in France, as Label fays, but is fown with it, almoft every where in Gardens. Parfenep fays, that it is rather Sown than Planted, for Sown among O- 

nions,
Chap. DCXXXIV.

Of Smallage or Water Parsley.

1. The Name. It is called in Arabic, Apium; in Greek, "Orsos"; in Latin, Apium, Apium Palatire, Apium Aquaticum, Apium Rugosum, Apium Petrosianum, in English Smallage, or Water Parsley.

2. The Kind. We make three several kinds of it: viz. 1. Apium, Apium Palatire, Apium Paludum, Apium Petrosianum, in English Smallage, or Water Parsley. 2. Apium Hirtum, Apium Cruiprum; this is a plant upon the Coast of Greece, which is called Apium Hirtum, and that it is only the thistle or Common Smallage, as it was called by the Greeks, when they planted it. Our Garden or Curled Smallage, which is the same, is called Smallage, or Water Smallage, and is the same as the former, but is called Curled Smallage, or Sweet Smallage.

3. The Description. The Root of this is not so strong as that of Parsley, but it is very thick and plump, with a number of Fibres or Strings adjoining to it. It grows up with greater boldness, and more yearly Stalks than Parsley, and the Stalks are broader, and of a darker green color, and flaring more than Parsley, somewhat unequally divided about the Edges, and the Tops of the Stalks stand large and open.

Smallage Common.
Smallage great or Garden.

Smallage, or our Garden or Curled Smallage, called Sallary. This is in all things, like the former, saveing that the Leaves are of a lighter green color, and Curled or something Crumpled without, which being laid along the Ground, and covered with Earth or Sand, become very white and eddable, and are very pleasant to the Taste or Palate. Some Authors will have this to be the former Common Fennel, altered by Transplanting out of West Amish Ditches and places into Dryer Gardens, but Parkinson is not of that Opinion, and says it grows so naturally in Sardinia, from whence the Seed has been différèd into other parts, and so brought to us.

V. The third, or sweet Smallage. Its Root is great and long, with divers Fibres set therein, white, and much more juicy and pleasant, than either those of our Common Smallage, or Parsley, bearing a very warming and Comfortable Reflish, and nothing Offensive but that, and even the whole Herb, is as pleasant as if Sugar had been mixed with it; it grows up in the same manner as the first Comman Smallage does, but larger than it, the Leaves likewise are larger, but not of so deep a green color. The Flowers and Seed likewise are like those but something bigger. This plant in both its Reflish or

Taste and form, has been found to hold, for the first or second year, from the Seed which has been Sown, coming from beyond Seas. But as Sweet Fennel does degenerate, more and more when Sown in England, which always continues sweet whilst growing in its Native warm Countries, so is it with this Sweet Smallage, the Leaves also deep in their Verdure, and hone of their freshness, becoming more than ever, like to those of our Common Smallage. If the Stalks of this be laid in the Ground, and covered with Earth or Sand, they become white like them, and so are more pleasant to the Taste as a Salêt with Salt, Vinegar and Oil, and then it is called Sallary as the former.
Salmon's Herbal. Lib. I.

CHAP. DCXXXV.

Of SNAP-Dragon, or CALVES SNOT.

I. THE Names. It is called in Greek Αντίρρον, in Latinus, Antirrhinum, also Cramium, Or Leonis, Herba Similans, Leo herba, Penaphis minor, Opilis gera, and Canis Cerebrum Apateus, in English, Snap Dragon, or Calves Snot.

II. The Kinds. There are several sorts thereof, as 1. Antirrhinum album, White Snap Dragon. 2. Antirrhinum purpureum, Red Snap, Purple Snap Dragon. 3. Antirrhinum Porfagiun, Variegated Snap Dragon. 4. Antirrhinum Luturn, Yellow Snap-dragon: these four are all of the large Garden kind, the following are of the small, or rather smaller sorts, called the wild kinds. 5. Antirrhinum Sylvestre medium vel majoris, The Greater Wild Snap Dragon. 6. Antirrhinum rhabrum Batisia, Small Red Spanish Snap Dragon. 7. Antirrhinum flor albo alterum, Small White Howard's Snap Dragon. 8. Antirrhinum Sylvestre minus, The Lesser Wild Snap Dragon.

The Descriptions.

III. The first, or White Snap Dragon. Under this Description We shall comprehend in the main, the first four Garden kinds. Its Root consists of many White Strings, which persist in most places after they have given Seed, unless they are carefully defended in the Winter against the Cold. The Leaves of these Snap Dragons are much longer, and greener, than the Leaves of the Natural Vex, or of the Wild Vex, and are set successively upon the Tender Green Branches, which are spread on all sides, from the very bottom, bearing at the Tops many Flowers, four or five, resembling those of Toad-Vex, but much larger, and without any heel or Spur, of a fair white color, with a Yellow Spot in the Mouth, or Grap- ping-place. After the Flowers are full, in those places where the Students are not hard round Seed-Veils, fashioned somewhat like unto a Cabbage head, the Summer being cut off, wherein is contained small black Seed.

IV. The second, or Purple Snap Dragon. This is in Stalks, Leaves, and Flowers altogether like the former, and is large and great in every part or greater, the only difference in that, the flowers have pale Stammel, or Rose colored Flowers, with a Yellow Spot in the Mouth, and sometimes of a Pale color, almost Blush.

V. The
Chap. 635. English Herbs.

V. The third, or Variable Snap Dragon. The Roots in this are smaller than either of the former, and always perish after Sowing time. This Plant is something less than the foregoing, and tenderer than the last described, having also a Reddish or Blush colored Flower, softer than the former, but much bigger than the middle kind described in Sect. VII. following. The Yellow Spot in the Mouth of the Flower, has some white about it, and extending to both sides of the Spot, and their Heads and Seeds are like the former.

VI. The fourth, or Yellow Snap Dragon. It is like in form to the former kinds, and has Leaves as large as any of them, and very fair yellow flowers as large like wife as they, not differing in anything else from the first described. Let none imagine this to be a Linaria or Toad Flux, for in all its parts it is agreeable to the Snap Dragons.

VII. The fifth, the middle kind, or Greater Wild Snap Dragon. Its Root is small, and perishing every year, springing up again from the falling Seed. This greater wild kind rises up usually, but with one Stalk, branching forth on all sides into four other, on which are set long, and somewhat narrow thick dark green Leaves by couples, at the Tops of the Stalks and branches stand (in several places) reddish purple gaping flowers, in flags like those of the Garden kinds, but for less, and without any white color therein, after which come such like beads, like Cubes Sattis, as in the other, but not half so big, wherein is contained very small and brown Seed.

IX. The seventh, or small White Flower'd Snap Dragon. This differs very little from the
fower small alfo and whitift, and the Seed small and blacker then the Seed of that. Its Root likewife perishes after Seed time; and the Plant is raised the next year again of the Seed.

X. The Places. The fifth four are called the Garden kinds; the latter four, the Field or Wild kinds; altho’ they all grow Wild in Spain, Italy, and other hot Regions: but with us they all of them grow only in Gardens, the fifth four of which are chiefly fit by.

XI. The Times. The fifth four flower for the most part the second year after Sowing, from April, even to July, and the Seed is ripe not long after. The Wild flower also much about the same times, tho’ June and July even to the end of August. All these several sorts of this Plant, if they be once Sown in Gardens, they will grow continually there of their own accord, if they be suffered to thicke their Seed.

XII. The Qualities, Specification, Virtues and Use of these Plants are as yet unknown in the Art of Physick: But Matthewus says, that given (as propose he mean their Juice) mixed with Rose-water, or the Powder of the Seed, in like manner, they are good against Fits of the Mother. And Apuleius says, that the Distill’d Water or Decotion of the Herb and Root in Water, is a speedy remedy against the Rheum or Watering of the Eyes coming of a Hot Caufe, by washing them therewith, and bathing the Forehead, Temples and Eye-Brows with the fame.

CHAP. DCXXXVI.

Of SNEES-WORT.

1. THE Name. It is called in Greek, Ουλαίον, in Latin, Pternica, Ptnarica Sylvestris, and Sternatamontana: in English, Snees-wort.

The Descriptions.

III. The Sth, or Wild and Common Snees-wort. Its Root is tender, and full of Strings, creeping for about in the Earth, and in no time taketh up much Ground. It springs up for the most part with but one Stalk, which is repipled with many round and brittle Branches, before with long and narrow Leaves, dinted about the Edges like a Saw. At the Tops of the Stalk do grow
small single flowers, like thou of the Wild Daffy.

The whole Plant is sharp, being the Tongue and Sugar of graspermore. Scenting, from whence it took its Name Sternumamomentsia, or Sneeze-wort.

IV. The second, or Sneeze-wort with double flowers, for its roots are many long lynges, running here and there in the Ground. It is straight and slender stalks, fofts with long and narrow leaves, joints round about the edges in all repells like to the former single Wild Kind, which grows common with us almost every where: on the Tops of the Stalks grow four, five, or more white flowers, one above another, with a green leaf at the bottom of the foresaid every one of them, being small, thick, and very double, with a little yellowishness in the middle of every flower, like both for form and color to the flower of the Double Butterfem, but smaller. This Plant has no smell at all, but is delightful only for the double white flowers.

V. The third, or Sneeze-wort of Austria. It Brother long and yellow, with some Fibres adjoined to it, joining to it, persifying every year. It sends forth many Leaves, lying upon the Ground, being soft and smooth, somewhat long and narrow, green on one side and white on the other, of a little fine round feel and Soy. From among which rises up an heavy Stalk, about two feet high or better, having divers such like Leaves thereon, but lefts upon it few former branches, with every one for the most part, a small fealy white Silver head on them, from whence spring forth about twelve or fourteen hard, and feall long pointed leaves, as a border or Palle, about a number of small short Thorns in the Middle, allure like, or as if they were made of Broochment, white in the first appearing, but after wards being lose to their maturity, of a small fair black blentish purple color, without any smell to commend it, being pleasant only by the Propell of its form and color, and by its Durability, for being gathered in its perfection, it withers not, nor lozets its color in a long time, but keeps the same hue and affect without changing, for many years together, being put into a Paper Booke, or otherwise kept upon the Stalks, they become something brownish, having many small blackish long Seeds, lying among a great deal of White Down.

VI. The fourth, or small Spanish or Naples Sneeze-wort. Its Root is like the former, but smaller, and persifying in the same manner every year. It has such long and narrow soft leaves, being laid out so large as the former: that the Stalks rise not so high, but is divided into more, and more slender hard Branches: at the Tops thereof stand such like Scaly heads, but not so white or silver like, from whence shoot forth such like stiff hard Leaves, as the Border or Palle, but neither so large nor so many, being seldom above 6 or 8: neither are they of so fair a blentish purple color, but of a more pale diluted color, having many Thorns in the Middle. The Seed which follows is like the last aformentioned, but smaller. This Plant being a little handeled or rubbed between one fingers, sends forth a pretty sweet smell, or what is not unpleasant.

VII. This leaf in Gerard, is thus described. The Root is small, whitish, hard, and thorny, persishing when the Seed is ripe, for springing up again by the fall of the Seed. It rises up with a small, hard, tough, corner'd, whitish, woody Stalk, divided into many Branches, and those again divided into other branches like those of Cyran, or Elen bottle, about two feet high, on which grow long, narrow, yellowish leaves, without order, and of a bitter Tyle, whiter below then above, of the color of Wormwood leaues, being but one rib or Sinew, and thus in the middle of the leaf, and commonly turn downwards: on the Top of each slender Branch, grows one small Scaly head or knob, like that of Cyran, which brings forth a pale Purple flower, without smell, containing six, seven, eight, or more, small, hard, dry, sharp pointed leaves: in the middle of which grow many Stiff Chives, their Tops being of the Color of the flowers, which flowers fall not away, till the whole Herb perisheth, but change into a Rally color: Among these Chives long flat, blackish Seed, with a little heard at the Top. It remains green all the Winter, and the next spring sends forth a Stalk as foresaid. The Herb being touch'd or rubbed, sends forth a pleasant Aromatic smell, black, with a pleasant taste, being a good medicine against all sorts of Soreness, both inward and outward. So that if you aforesaid Plant be a Nurse of it, it is wher it is a most pleasant Herb, and very profitable against all sorts of Soreness, both inward and outward.

VIII. The Places. The first grows Wild in dry and barren Pastures and other places: and has been found in the three great Fields next adjoining to Kentish Town near London: and in several Fields in Kent about Southwark, and it is also brought into Gardens in many places. The second grows here in Gardens. The third grows, as Matthiellaeus guy, in Italy, Chefard found it in Austria, it has been found growing in all the South Parts, and also in France, and as Lobel says in France. The fourth grows in Spain and Naples, from whence the Seed has been brought to us, these last two grow with us only in Gardens.

IX. The Times. They flower in the end of Junes, and in July and August, and the Seed is ripe in some little time after, as in August or September.

X. The Qualities, Specification, Preparations, Virtues and Uses of the first and second Species we have declared at large in Chap. 553: aforegoing, under the Title of Pallony of Span, and Wild: so that we shall lay nothing more of them in this place.

XI. The two latter, Parthe isy says have not been much used in Physick, but Chefard says, that about Vienna in Austria, the People fall ill to the Apothecaries for Scabious, and that the Declaration of them, given to Children, is very good to ease them of pains and Tumors in the Stomach and Bowels: and some Authors think, that it may have some of the Properties of Scabious, or of尹as at leaf, because if it near approaches to them both in its form and Temperature.

CHAP DCXXXVII.

OF SOLOMONS-SEAL.

1. THE Name. It is called in Greek, Σίγλιλαμος, in Latin, Polygonatum S. (A Radix geniculato- lorum frequentibus nodis, from the many Nodes or Knots in the Roots) of some Scal Cat. Havens Ladder, from the form of the Stalks of Leaves, being set one above the other: also Sigillum Solomonis, in English, Solomon Seal, &c.
from the White Knobs in some places of the Root, with a flat round Circles, representing a Seal, whence came this Name.

II. The Kind. Authors have made a dozen severall sorts or more, but we shall content our selves, with what grows in our own Nation, or in our Western Plantations in America, viz. 1. Polygonatum Foliosum, by some Polygonatum Articulatum, by others major, and by many Sigill-atum Solomonicum, our common Solomon Seal. 2. Polygonatum Majus-flow majus, Polygonatum latif-oli.an, saccatum Chilly, the greater flowered, or sweet smelling Solomons Seal. 3. Polygonatum Virginiae, Solomons Seal of Virginia. 4. Polygonatum racemosum Americaninum, thicker like Solomons Seal. 5. Polygonatum Racemosum per-fo.licatum Americaninum major & minor. Threelav'd Solomons Seal of America greater and better.

The Descriptions.

III. The fifth, or our Common Solomon's Seal. The Root is of the thickness of a Man's Finger or Thumb, white and knobbed in some places, with a flat round Circle, representing a Seal, lying along under the upper face of the Ground, and not growing downwards, but with many Fibres underneath. It rises up with a round Stalk, about half a yard high, bowing or bending down the Tops, for with single leaves one above another, which are something larger, and like unto the Leaves of Lily Convallary, and of the same color, viz. with an Eye of bluishness upon the Green, but more yellowish underneath, with four Rolls running through them. At the foot of every Leaf along, from the bottom of the Stalk up to the Top, come forth small, long, white, and yellow pendulous flowers, something like the Flowers of Lilly Convallary, but ending in five longer Petals, for the much part two together at the end of a long foot Stalk, and sometimes but one, and sometimes also, two Stalks with Flowers at the foot of a Leaf, which have no flutter at all, and stuck all on the one side of the Stalk. After they are full, come in their places, small round berries, green at the first, and blackish green, tending to blueness, when they are ripe, in which be small, white, hard, and flinty Seed. Camerarius in his Epitome says, (citing Matthiolus as his Author) that it is sometimes found with red Berries, and also with Purple. These Berries being ripe are of the binomial of Joy Berries, of a very sweet and pleasant Taste. The Root also is sweet at the first tasting, but afterwards of a bitter Taste with some bitterness.

IV. The second, or greater flower'd, or sweet smelling Solomons Seal. The Root if this is exactly like the former, but larger if it grows in good Ground, otherwise inferior. The Stalks are shorter, not much above a foot high, and somewhat flatter. The Leaves are flatter, and rounder pointed, set on one side of the Leaf, as the
small Seed, or big as a Titch or Lott, and as hard as a Stone.

V. The third, or Solomon's Seal of Virginia. The Root of this is slender, long and Creeping, like as many others of the Virginia Plants, and much resembles the former are. It rises up with a Stalk or Stalks, a foot or more high, with Leaves of the same fashion, long, Narrow, very green and shining, standing one above another upon a single upright Stalk, which is sometimes a little branched. These leaves are not of so sad a green as the other, nor discolored underneath, as at the top of the Stalk come forth the flowers, and many of them grow together, which are white and smaller, and nothing so long and Pendulous, ending in small fine point

ed Leaves. After which come the Berries, which in this are the flattest of any of the former, and of a mild Orient Red, or sober color (which some by a mistake formerly took for Cherries Berries, but were in truth as small things, being not be

ing bigger in the nodule) which while they are white, and before they are ripe, have five black Strakes on every of them, equally distant, but are quite wound not being ripe, within which are contained, white, hard, Stony graver or Seeds, like those of the others.

VI. The fourth, or Cuffler-like Solomon's Seal. Its Root is thick, white, Tangerous, long, and many jointed, as by differences, with five to six small branches thereon. It flowers up a round branched single Stalk, and sometimes parted or branched, about a foot high, set with many

fair, broad Leaves, some being of a reddish, others of a sad green color, harder than others, and compassed about the edges with a rougher and darker Lift. As the tops of the Branches, grow in open Clusters, many small pale col-

ored Thistles, like unto Viole Blossom, which pos

ing away, there succeed several small Berries, in form almost of a Cluster of Grapes, and each of the largest of a Jupiter Berry, yellowish before they be ripe, and firmly spotted with blood speckles, which after they have hung so long to be ripe, near out, and the whole Berry grows red like a Cherry, whole Pulp or Juice is juice, and contain within them small white roundish

Grains or Seed.

VII. The fifth, or True-leaved Solomon's Seal

of America, the greater kind. Its Root is nothing so thick or white, as the last described, but is followed by many springs into the Earth. It has a slender slender Stalk or two, about half a foot high or more, parted about the middle into two branches, and each of them again into others, being fair, broad and long, and very pale green ribbed Leaves, compassing the stalk whereto at the bottoms at each of which joints, with the Leaves, and at the Taps, also fling the flowers singly, composed of five long and narrow yellow Leaves hanging downward, in the middle three

of a crossed head or horn, composed with five yellow heads or Chinar, when the flower is full the same Stalk thereof rises up, bearing that Crossed or

flattened head, three cornered shiningabo, till the end, bearing nothing Seed within it. The latter fort is in all things and respects like to the greater, but every ways leffer, the Leaves being not only smaller but much narrower also.

VIII. The Places. The first grows Wild fre

quently in many places of England, as on the North Side of Mendip in the Parish of Shippen

Mallet, in Somersetshire, upon a Row Hill by Crawfield in Kent, in Oadum Park in Hampshire,
in Bradford's Wood near a Town Four Miles from York, in Wiltshire, in a Village near Healey, five Miles from Gooseford to Saxby, in a Wood by Kirkpost-Hill, two Miles from Lancaster; in a Baby clive belonging to the Parsonage of Al
debury near Chiloton, two Miles from Salis

bury; and in Cheffon Wood on Chefen-Hill, be

tween Nemington and Sitiagturn in Kent, it is also in several other places. The second grows Wild in our Gardens, and I found it also growing in Carolina. The other three, grow in several places in America, but with us only in Con

dens.

IX. The Timers. They all spring up in March, and the first flowers in May; the other Ameri
can kinds in June and July; the Berries are ripe in September, and continue on the Stalks, till the Frosts come, and then they fall down with the Stalks, which rot and perish with all above Ground; the Root standing all Winter, and shooting forth a new every year.

X. The Qualities. Solomon's Seed is temperate in respect to heat or cold, but dry in the se

cond degree. It is Alfringent, and as Galen

says, of a mixt property, being partly binding and partly of a sharp and biting quality, with a little bitterness, which property we perceive not in those which grow in our Countries.

XI. The Specifcation. The Root is chiefly used, and next principally, of the first kind. In heals Ruptures and broken Bones, and fops Fissures of the Belly, the Reds and Whites in Women, and running of the Reins in Men: as also Yo

mitings, Bleedings, and deflations of humors upon any part, and is very available to heal simple Green Wounds, running Sores, and other like Hurts whether outward or inward.

XII. The Preparations. You may have there

from. 1. A Juice or Essence of the Root and Herb. 2. A Decotion of the Root in Wine or

Water. 3. An Infusion of the Root in Wine. 4. A Powder of the Root. 5. An Ointment or

7. An Apothecary of the Root. 8. A Disin

fled Water. 9. A Spirituous Tincture.

The Virtues.

XIII. The Juice or Essence. A Spacious of either of them, or something more, taken at a
time morning and evening in a Ghifh of Sheep

rick Red Wine, or in Smittis Forge Water, is said to Cure Ruptures when the Guts fall

into the Cods, a Cataplasm of the Root being applied outwardly to the same. They are also available, to cure the overflowings of the Terms and Whites in Women, and a Gonorrea in Men, and incomparably good to knit and compul

titate broken bones inwardly taken: outwardly applied being made into a Cataplasm with Rye or Wheat Meal. They dry up and congeal the lips of Green Wounds, and stop the flow of

humors upon Ulcers, they being washed and chanclced therewith. Sm巨ft up the Noffills, they are said to draw them out of the head, and fo cafe the pain thereof.

XIV. The Decotion in Wine or Water. It has all the former Virtues; is available for outward and inward Bruises, Falls or Blowes, calf pains, diuileve congealed blood, and take away the black and blow marks made by Contusions, or other hurts. Dole half a Pint.

XV. The
XV. The Infusion in Wine. It is made of the Root being Bruised, and steeped all Night in the Wine. It has all the Virtues of the Juice, Efficacy, and Decoction: taken to a quarter of a Pint or more, morning and night, it orders and gives together broken Bones very speedily and strongly, the Bones lie but tenderly and untractably placed, a Cataplasm of the Juice, or Root, being applied also to the same.

XVI. The Powder of the Root. It is given to a Deaf or more, morning and evening, in Drinks or Beeth, against Ruptures, broken Bones, Wounds and Inward Bruises, and being also made into a Cataplasm with the Juice, and outwardly applied to the parts affected.

XVII. The Ointment of Balsam. They wonderfully dry, heal and congeature simple green Wounds, and Knit, and join together simple Injuries of bones, ease pains, and strengthen a weak Back whether in Men or Women.

XVIII. The Cataplasm of the Root. It is applied outwardly in simple Contusions or Bruises, Falls, Blows, Ruptures of the Peritonum, Fractures of the Bones, Dillocations, Dislocations of Humors, and weaknesses in any part. It has been found by late Experience, to be incomparably good to knit and join broken Bones in any part of the Body, and is profitable for those which by any wounds, have their Bones often out of joint, or will not stay long in when they are set, being applied for some considerable time.

XIX. The Apothekeon of the Root. The simple raw Root being chewed in the Mouth, draws away much Flegm and Vicious Humors from the parts adjacent, and gives ease in the Tooth-sach.

XX. The Distilled Water of the whole Herb and Root. It is fit to cleanse the Skin from Scurf, Morphew, Tanning, Sunburning, Spots, Freckles, and other Marks and Defecations, leaving the places soft, fresh, and fair, after it has been for some time used, and is used also as a Vehicle to take the other preparations in.

XXI. The Spiritual Tincture. It has all the Virtues of the Juice, Efficacy, Decoction and Infusion, being inwardly taken to a Spontaneous at a time in any proper Vehicle, and outwardly applied to the parts affected. It also stops all Fluxes of the Bowels after an admirable manner, chiefly the Bloody Flux.

CHAP. DCXXXVIII.

Of SOLDIER-WATER.

I. THE Names. It is called in Greek Ψυθεροντις, Ο Ψυγεωνις κατακρατις τω Άλειοι; in Latin, by Matthiolus, Statives aquaties, and to allo by Lagomagin; it is the Statives of Militari Aethor, Lobelia, Statives pantorim & Sedum aquilegum, Dobanes: in English Water Soldier, Butch Water Soldier, and Water Bugle: it is called in Wine. It has all the Warrior.

II. THE KINDS. It is a singular Plant of the fort, but Basinhei accounts it among the forts of Aloes, and calls it, Aloes polytimes, Water or Marth Aloes.

The Descriptions.

III. At the bottoms of the Leaves there is a small short head, broadest near the Leaves and smallest downwards, from whence proceed several long Strings like small Worms (when with 4 or Dodonias Jests, 40 Crafty Quick Solvers, putting them into Glasses, set water, to make them show the greater, make others believe, that they are Worms which come out of the Bodies of their Patients;) these Strings having several Fibres at their Ends, take Root in the

Water Soldier.
Chap. 639. English Herbs.

The Virtues.

X. The Juice or Essence. Taken to One or Two Spoonfuls or more at a time, in any proper Liquor, as some stypticke Red Wine, or in Smith’s Powder Water, or in its own Distilled Water, it cures Pifing of Blood, and also the Bloody Flux, and the overflowing of the Terms in Women; but Pliny adds, Blackbarm in Powder thinned with Antidote from which is made Anthered. As it provokes, or abates, or abates, it cool’s them, and excites the Pain, and is good to heal simple Wounds, foul running Sores, Ulcers, and Fistulas.

XI. The Decotion in Wine or Water. It has all the former Virtues, but may be given in a much larger Dose, as from a quarter of a Pint to half a Pint: If Honey is distill’d in it, it makes a good Garganum for a Sore Mouth and Throat; and being Bathed upon any Intimation or painful Tumor, it abates it, and gives ease in the Pain.

XII. The Powder. It has the Virtues of the Juice and Decotion; and may be given at a dram at a time, morning and evening, for all the purposes aforesaid, in any proper Vehicle, frownd thick upon any foul running Sore or Ulcer, it cleanses, drys up the humors, and induces the healing. Althaea says, it is given every morning fasting, to stop the overflowing of the Courtes in Women, as also other Fluxes of Blood, in any part of the Body.

XIII. The Cataplasm. It is made of the Bruft ed Leaves, and is applied by Country people, to heal any simple given Wound, which is said to do, to address the blood, Applied in the Extreme of the Gout, it is a singular thing to ease the Pain, and that in a short time.

XIV. The Ointment or Balfam. They are good Vulgarities, repels the flux of humors to the pain, eases pain in a Wound, running Sore or Ulcer, cleans, dry, and heal the disfusled part, being also washed with the Juice or Decotion.

XV. The Distilled Water. It is used as a Vehicle, to take the Juice or Essence in; and mixed with Honey makes a Garganum for a Sore Mouth and Throat; a little Camphir diffolved and mixed with it, makes a good Ophthalmick, for Sore, Rheumy, and Watering Eyes; and to all it is a very good thing to clear the Skin from any kind of Deformity.

CHAP. DCXXXIX.

Of Sopewort, or, Bruise-wort.

The Descriptions.

III. The Sift, or Our Common Sopewort. Its Roots creep under ground far and near, with many Fruits, brown color on the outside, and yellowish within, having towns in joints, fit with two Leaves apiece at every one of them, on the contrary side, which are Rubbed something like unto Plantain, and flattened like the Common field white Campion Leaves, seldom having any Branches from the sides of the Stalks, but set with divers flowers at the Top, standing in long branches, like the Wild Camomile, made of five Leaves apiece, round at their ends, and a little dent in their middles, of a pale Rose color, almost White, sometimes paler, and sometimes of a deeper color, having a reasonable good smell.

IV. Gerard describes it thus. Its Roots are thick, long, creeping off, having certain fringes hanging at them, like the Roots of black Heliotrope, which if they have once taken good and sure footing in any ground, it is almost impossible to destroy the Plant. The Stalks are slippery, slender, and a foot and a half high or higher; the Leaves are broad, set upon crisp, very like broad Leaved Plantain, but differ, growing
Sopewort or Bruise-wort.

There are many low and wet grounds in several parts of this Land, and near to Rivers and running Brooks in Sunny places, but is now brought into Gardens for the flower sake, serving chiefly for the Smoking up of Houses. The second or Double flower'd was brought to us from beyond Sea, and is only Nutt up in Gardens. This third is a Native of England, and has been found growing in a little Groves, called the Spanny near Litchborough in Northamptonshire.

VIII. The Flowers. They flower in June and July, and to continue all August, and part of September, before they are quite spent.

IX. The Squill. They are hot and dry in the fifth degree, Aperitif, Ablerifie, Diuretic, Emollient and Vulnarea, Stomatch, Hepatic, Nephtic, and Laxative, from their flowering faculty.

X. The Specification. They open obstructions of the Rein and Womb, cleanse the Bowels, and are good against Sand, Gravel, and Tartar in the Rein and Bladder; profitable for the healing of Wounds, and is laid by Some to be a Cure for the Lues Venerea, or French Pox.

XI. The Preparations. You may make there of, 1. A Juice or Essence. 2. A Decoction of the Leaves according to Septarius. 3. An Ointment or Emulsion. 4. A Cappage.

The Virtues.

XII. The Juice or Essence. They provoke Urine, and cleanse the Urinary passages from Sand, and Gravel, and Tartarous matter, give ease to the Strangury, loosen the Belly, and are said to be profitable against the Dropie, and the fist Difflead. Dole 2 Spoonfuls or more mixt with any proper Vehicle.

XIII. The Decoction of Septarius. Take fresh or green Sopewort a handful: Infuse for a night in a Pint of Water, the next morning boil them together, and strain out by pressing the half of the Water together with Raifons or white Sugar; to be drank as ordinary drink at Meals: the other half is to be reduced to be taken 7 or 8 Ounces at a time every morning after what it in bed, and gently to sweat upon it. To such as are Oferfick, it is to be exhibited being made with the addition of a half of Sow-thistles, or Navel-wort, or in Women's cases with the further addition of half a bunch of Filipendula. Viater (diure tot) & pro muliebris ad menstrua saha absumund. Sau Lauris Iys, that one Zepa et Spaniard found out the Virtue of this Plant, since whole time it has been written of by Englishs Roman de morti & venesc-
of SORREL Garden and Wild.

I. The Name. It is called by the Arabians, as Sarpejo, Humathur in Greek, Oysio, and by Galen, Oxalidum, i.e., Lapathum acidum or Rovena acidia in Latin. Oxalis from the Greek, and Acetofa in English Sorrel.

II. The Kinds. There are several species of this Plant. 1. Oxalis fivio or Acetofa bortenzi, alfo simply Acetofa, Our Common Garden Sorrel. 2. Acetofa maxima Germanica, Great German Sorrel. 3. Oxalis fives or Acetofa Sativa vel Romana, roundfiddo, Round Leaf'd or Roman Sorrel. 4. Oxalis radice Tuberofa, Tuberous Rooted Sorrel. 5. Oxalis sphegra, Acetofa Sphycra, Acetofafo, Lapatatum acidum, Acetofa minor Lanceolata, Sheeps Sorrel, or Field Sorrel. 6. Acetofa Cambria-Britannica Monarchica, Mountain Sorrel of Wales. 7. Acetofa Americana, Acetofa Victioria Americana, WeltIndia Sorrel, or American Sorrel.

The Descriptions.

III. The fifth, or Our Common Garden Sorrel. Its Root is fonder than any Dock Root, brown, and full of Strings, white all Winter without decaying, and has green Leaves all the while, except in the very extremity of Frith and Snow, which many times confers its Leaves to perish. It springs up with tender long green Leaves, far and full of Jacs, brood, and accep't as it were, near unto the Stalk like Arach Spinage, or Our English Mercury, having a pleasant fivre

foore Taste. The Stalks are fnder, bearing purplish long heads, in which he three corner'd, bearing brown Seed, like, but better than that of Docks.

Garden Sorrel.

IV. The second, or Great German Sorrel. Its Root and manner of growing is like the former, but the Leaves thereof are much larger, and sometimes a little Car'd or Edges, the joints of the Stalks are great and Tuberous, finking out like Roots, which being taken from the Stalk, and put into the Ground, will take Root, and bring forth Leaves like the Alther Plant, the Seed, and all its other parts, are answerable to the proportion of the Leaves.

V. The third, or Round Leaf'd, or Roman Sorrel. Its Root is fonder and thicker, creeping about for the most part every where, and flowing up heads of Leaves round about. In the Leaves of this Sorrel the chief difference confists, which are short and almoft round in some plants, and in others somewhat round pointed, with Ears or pieces on both fides next the Foot-fall, of a paler green color than the former. The Stalks are weaker, not standing upright, but the Flowers and Seed differ not from the Common Garden fort. The Tafle is of a much more pleasent flargene than the others, and therefore the more desirable in Sallers and Souces.

VI. The fourth, or Tuberous Rooted Sorrel. Its Roots are many Tuberous Chips, furred by ftringes to the lower part of the ftem, not much unlike to tho'se of Peony, or Vifpendula, from the head of the Root the Leaves spring forth, which are in form something like to the Ordinary or Common Garden Sorrel, but larger, sharp pointed, and not fo broad next to the Foot-fall. The Stalks, Flowers and Seed, are answerable to the Common Kind, but the Leaves grow confedely upon the Stalk, without any order, not differing much in form, from tho'se of Patience, Garden Dock, or Monks Rhubarb.

VII. The fifth, or Sheeps Sorrel, or Field Sorrel. Its Root is long, branched out and prongy. It does not much differ from the Common Garden & S

Sorrel,
Salmon's Herbal.

XV. The Juice or Essence. Given from one Spoonful to three, either alone, or with some proper Vehicle, they cool the heat of Fevers, quench Thirst, and take away the multitude of Infections and Pestilential Diforders. Mix vomition, given with Syrup of Mint, or mix with Mint Water, abate the heat and over-boiling of Choler in the Stomach, provoke Appetite, and after a regular manner refresh the Spirits. Mix with Honey, or Syrup of Mulberries, and a little Surtick Red Wine, they cure Canker and Ulcers in the Mouth and Throat.

XVI. The Decoction in Water or Wine. It has all the Virtues of the Juice or Essence, but nothing so powerful, and therefore may be taken to half a pint or more at a time. Mix with the Honey of Rofs, and Wine, it makes a good Garguin for a sore Mouth or Throat; and it will be so much the more excellent if in every Pint thereof two or three Drams of Sal Prunella be dissolved in it, more effectually if it proceeds from heat and Inflammation.

XVIII. The
Chap. 641. English Herbs.

XVIII. The Syrup. It is generally made of the juice, and is effectual in all the aforesaid, and is profitable against a hot Carcin, or flux of Rheum filling upon the Throat, and Lungs, &c. refills purgation.

XIX. The Cataplasm. It may be made either of the Cold Green Herbs, a little bruised: or of the Green Herb, stewed by it self without any addition in a Sworse-pan, or between two Pow-

rer Dilutes; it is good against Wounds and Ulcers made by Puncktures, Thrusts, Cuts and the like, stops their bleeding, cleanses and heals them speedily. It also eases pains of the Gout, and cools the heat of Inflammations, &c. It is good against frettings and galling of the Skin, Kingworms, Tetter, &c. The Leaves wrapped up in a Colewort Leaf, and so roasted under the Embers, and then applied as a Cataplasm to any hard Apolem, Both, Boil, or Plague Sore, it ripens and breaks them, and helps also to subdue Swomous or feverous frettings in the Throat and other parts.

XX. The Distilled Water. It is good for all the purposes aforesaid, but must be taken in large quantities, as four or five Ounces at a time, sweetened with the Syrup aftercoping. Take Juice of Sorrel fox Owners: of the Distilled Water two Ounces: Syrup of Sorrel one Ounce and a half, mix them. Of this the Patient may take two or three Spoonfuls now and then, in any hot discretion, or burning Fever; it cools Inflammation and heat of the Blood in Agues, refi-

ds phlegmatic difeases, saves the heart and Boiling of Choler, refors the Plants of the Blood, revives the fainting Spirits, repairs the violence and furious hot flux of Agues, quenches Third, provokes Appetites, Kills Worms, and is truly Cordial, expells Gravel and Stone from the Reins and Bladder, and is profitable against the Jaundice.

XXI. The Powder of the Seed. Given to a Draught in any proper Vehicle, it clears the heart, revives the Spirits, Kills Worms in the Body, stops Carcin, and the Terms in Women, also the Bloody flux, and all other fluxes of the Bowels, Vomiting, &c. likewise being taken 2 or 3 times a day, it is said to refit the Poifon of the Scorpion.

C H A P. DCXLII. of SORREL WOOD, or, SORRE TREFOIL

I. THE Name. It is called in Greek Υρά, and in Latin, Oxys, Oxys Flaminia Lib. 25, Cap. 12. Oxyryphylum Trogi and Laxum, (but Oxyryphylum, is a more proper Name for the thorny pointed Trefoile) Trefoilium acetosum, Penni Cauda, (Cocke men) also Alcetia, (because it was in flower, when in Ancient times, Alcetia was wont to be sung in Church) and Letula (a corrupted word from \( \text{f} \)ufoila, as in California in the Kingdom of Naples it is called.) in English, Wood Sorrel, or Sour Treffoil.

II. The Kinds. The chief sorts common with us are, 1. Oxys Plantæ, Allatia, Letula, Oxys alba Commis, Trefoilium acetosum Pulchrum, Our Common Wood Sorrel. 2. Oxys floræ Laxæ Clufs. Oxys late carinata repens Laebii, Trefoilium acetosum cornicolatum Basbini, Oxys Americana, Yellow Flower’d Wood Sorrel.

The Descriptions.

III. The first, or Our Common Wood Sorrel. Its Roots are nothing but Strongs filled to the end of a small long Piece, all of them being of a yellownish color, not persisting every year, but abbling with some Leaves thereon in the Winter. It grows low upon the Ground without any Stalks, rising from it, having a number of Leaves coming from the Root, which Leaves are made of three parts like a Trefoile, but broad at the ends, and can or dented in their middle (almost in form of a Heart) of a faint yellowish green color, each one standing on a long Footstalk, which at

Sorrel Wood Common.
Salmon's Herbal. Lib. I

1052

of three Leafe'd groes, and is a low and humble herb, without Stalks; the Leaves immediately rising from the Root upon short Stems: at their firi going forth folded together, but afterwards spreading themselves abroad, of a fair light green color, in number three, like the leaf of the Vine, but that each Leaf has a deep cleft in the middle. Among these Leaves come up small and weak tender Stems, such as the Leaves do grow on, which bear small Starlike flowers of a white color, with some brightness of Coranion light over the same. The flower confifts of five the former, but are much smaller, and of a paler Green color: at the Joints with the Leaves come forth three or four small flowers together, at the end of a long Foolsfoot, yet each separate from the other, consisting of small and Punctate Leaves like the former, but contained in smaller, and longer heads, like Cuds or Horns, yet not cotton but pointed small, which quickly fall away being touched when they are ripe, and firing up again all about where it grows.

VI. The Places. The fift grows very plentifully in many places in England, in Woods and by Wood-sides, where it may be moff, and shadowed from the Sun, also in other places not too open to the Sun Beams. The second grows in Spain, Italy and Sicily, but in a vault plenty in almost all our warme plantations of Maze, in South Carolina, and other places adjacent thereto, where I have gathering it many times: there is scarcely any Herb which grows in greater plenty in those Countries than this.

VII. The Times. The fift flowers early in April and May, the other in June, July and August, and to continues in flower, till the Cold of Autumn caufes it to perifh, the Seed ripen-

VIII. The Qualities. These are of the Tem-

perature, and properties of Common Sorrel in the former Chapter, but more Potent to all those purposes, and are special Aperient and Bitters against the Plague, and all fefts of Peltillential, Maligns, and Burning Fevers.

IX. The Specification. Wood Sorrel refits Vomiting, strengthens the Stomach, kinders purgation of the Blood, quenches Thirst, provokes Appetite, and is effectual against the Plague, Spotted Fever, Calentures, and other like malignant diseases.

X. The Preparations. You may make there-

from, 1. A Juice. 2. A Decoction or rather In-

fusion. 3. A Syrup. 4. A Confitw. 5. A Co-

Chin. 6. A Distilled water.

The Virtues.

XI. The Juice. It has all the before Spe-

cified Virtues, cools inflammations, takes away all preternatural heats, whether in the Stomach, Bowels, or habit of the Body, refists putrefaction, and is most singularly excellent against any Contagious sickness, or Peltillential Fever. Mixt with a fit quantity of double refined Sugar, it makes moft incomparable Green Sugar.

XII. The Decoction or Infuion. They have the Virtues of the Juice, but not fo effectual, and may be given half a Pint at a Time: if they are made in Wine (whether White or Red,) they will be fo much the more effectual in some cafes, more especially where no Fever is present.

XIII. The Syrup. It is effectual in all the Cafes aformention'd, does exceedingly cool, and abates the heat of Fevers, and mixed with the Juice, makes an excellent Gargarium for a Sore Mouth and Throat, being Gargled therewith and fipt out, and then fith taken in, it wonderfully helps a finking foul Canker, or Ulcer in thofe parts; and is singular good in Wounds made by Cut or Puncture, stopping their bleeding, and caufing them rapidly to heal.

XIV. The
Chap. 642. English Herbs.

XIV. The Cretean. It is Cordial, refreshing in hot Fevers, Stops Vomiting, and Strengthens a weak Stomach, and is profitable against Caruneas or hot defecrations of Rheum upon the Stomach and Lungs.

XV. The Creton. It is made either of the whole green herb bruised, or made of the Herb, flowed between two Pewter Dishes, and brought to a Confidence with Crumbs of white Bread. It aures the heat of Inflammations and other hot Tumors, cues simple Contusions, being pleasantly applied, viz. whilst they are re- cast, applied to simple green Wounds also, it heals them in a short time, by stoppings the Hemorrhage and constringing their Lipts.

XVI. The Distilled Water. It has all the Virtues of the Juice and Distillation or Infusion, but very much weaker: It quenches thirst, and cools inward heats of the Stomach, Lungs and Liver, being taken morning, noon, and night, half a Pint at a time, inward with the Syrup aforesaid; and so mixed it makes a good Gargarism for sore and Cankerous Mouts and Throats.

C H A P. DCXLI.

Of SOUTHERNWOOD.

I. The Name. It is called in Arabeck, Calcyum, Keftum, or Gaffum: in Greek, Acmum: in Latin, Abrotanum, after the Greek, but more usually abrotum as the Shops call it: and in English, Southernwood.

II. The Kinds. Authors have a great many Species of this Plant, we shall only Treat of the four following, as being more usual with us. 1. Abrotanum mas, Abrotanum vulgaris, Abrotanum nigrosum Cordis, Our Common Southernwood. 2. Abrotanum mas Angelosifolium Baumii, Abrotanum Magnum Comprehensum vulgaris Instructo Curarum, Great Southernwood. 3. Abrotanum Feminum arborefcentis Ddum, Abrotanum latisfolum arborefcentis Baumii, Abrotanum arborefcentis Gerardii, Lobeli, Lagtum, and Tephrobrum. True Southernwood, or Female Southernwood, formerly, and by some Rauthors Leventer Colon was accounted to be the Female Southernwood, and called Abrotanum feminis, but that is error. 4. Abrotanum edulis Bufatilia, Abrotanum bunam & denfe frutifum Lobeli, Abrotanum Terrium Tragi, Abrotanum mas Angelosifolium minor, Small Sweet Southernwood.

The Descriptions.

III. The first, or Our Common Southernwood. Its Root grows not very deep, but is Woody with several Strings adhering to it. It rises up with many Heath, and Woody Branches bending downward, as if they were not held up, especially while they are small, for the other flowers are more firming and great, rising in time to be higher than a Man, from which grow our many small and long Branches, on which are set many small, fine and short Leaves, as late as Feniis, but not so long, of a Greyish or Buffet green color, of a strong pleasant facet, and somewhat bitter taste. From the middle almost to the Tips of the upper spoon, grows small round yellow Flowers, hanging like little Buttons, which never open much, but fall away, and after them come the Seed, which is smaller than that of Wormwood. The Stalks and Branches lie all their Leaves over, and from forth from in the Spring. This is our Common Garden Southernwood, the others being not so useful, and for the most part called by other Names, falsely being acknowledged to be any Species herof.

IV. The second, or Great Southernwood. The Root is like the first which is woody, and runs under ground in the same manner. This greater kind is altogether like the former, growing as high, or rather higher, and with Leaves like abundance, but somewhat larger and greener, and of a more exminent facet, and altogether so pleasant as that, but coming something more to Campbris or Frankincense. The flowers and Seed differ not from the first common, but are like to them in all respects.

V. The third, or True Southernwood, or Female Southernwood. Its Root is woody, spreading it self out with many Strings and Vibras. It is a rare Plant, grows upright with one Stem or stalk, to a Mans height, if the lower small spoons be cut off from it in the growing, and shoots forth many Branches on all sides, on which grow many leaves, very much cut in, and divided, but are nothing so fine and small as the former, but yet a little quicker, and nearer refreshing Wormwood, as it does also in its taste, and more aromatic than common Southernwood. The flowers stand at the Tips of the Branches, being more plentiful, and larger than
The Virtues.

XII. The Liquid Juice. It is a counter-poisom, or Antidote against all deadly poison, the bitings of Serpents, of the Philogogus or other Venemous Creatures, provokes Urine, and the Terms in Women, facilitates the Birth, and brings away the Atephrith. Dole one or two Spoonfuls in a Glass of Wine.
Bald Pare, it is tald to cause the Hiar to grow again, and some fay, that the juice thereof mixt with Oyl does the fame thing.

XXI. The Spirititwater. It is Diuretic, and tald to help them much which are troubled with the Stone, and prevails also against Wind, Vomits, and obstructions of Liver, Spleen, Renl, and Womb. It is not fo grateful as Wormwood Water, yet strengthens the Stomach, and other Villages.

XXII. The Spiritus. It comforts and strengthens the Head, Brain, Nerves, Eyes, Stomach, Spleen, Relh, and Womb, is good against Pain-

legs, Sweating, Convulsions, and other dilatations of the Preventa, &c.

XXIII. The Distilled Oil. It is prevalent a-against Pallsies, Num团体eles, Tremblings, Cramps, Convulsions, Pains, Patches, and other like Dilata-ions of the Head, Brain, Nerves, and other parts, being anointed upon the Spina Dorsii and places afficted: it also taken inwardly from 1 to 3 Drops in any convenient Vehicle. In it

provokes Urine and the Terms, haSpens and facili-

fates the Birth and After-Birth, eafe or pre-

vents, after pains and causes due cleansing, &c.

XXIV. The Spirituous Tincture. It has all the virtues of the Juice, Efficacy and Palatibn, but is much more strongmell, and may be given from 2 Diamons to 4, in any convenient Vehicle.

XXV. The Acid Tincture. It is prevalent a-

against the Plague or Pestilence, Spotted Fever, Calenture, and all other Contagious and Infection-

Dilataions, strengthens the Stomach, and ot-

her Vifcera, causes a good Appetite and Dis-

gestion, and after an Emetic, is a singular good thing against Surfeiting and Drunkennefs, and has indeed all the other Virtues of the Liquid

Juice, Efficacy, Deoelition and Pouder. Dofe, fo

many Drops as to make the Vehicle grateful-

ly keft.

XXVI. The Oily Tincture. It is a potent thing against Sand, Gravel, Stones, and Tanninous mat-ter in the Reins, Urine, and Bladder, gives eafe in the Stomachy, takes away Pain, Heat, and Seddling of Urine, is prorolable against the

Colick, expels Wind, provokes the Terms, ha-

Spens and facilitates the Birth, After-Birth, &c.

Dofe at gun. x ad xxx, or more, (upon an Exi-

gency) in any proper Liquor.

C H A P. DCXLIII.

OF S O W - B R E A D.

I. T H E NAME. It is called in Grec, K.UNKNOWN 1 by the Arabians, Buchaneres, in Latin, Cyclamen, Cyclasem, Artandi, Paris Parvifum, Tuber Tera, Terra Repon : in Eng-

lish, Sow-Bread.

II. THE KINDS. Authors have given us many Species of this Plant, at least a Dozen sever-

al Powered, but we shall chiefly Treat of those which are most common with us, which are the following, viz. 1. Cyclamen Vulgar folio rotundato, Artandi Commune, Our Common Sow-Bread. 2. Cyclamen Veroa Rotundato, irravsernum, Ivice Leand Sow-Bread. 3. Cyclamen Veronum florae purpureae, Spring Sow-Bread Purple Flower'd.

The Descriptions.

III. The Sow, Or Our Common Sowbread, (which is most used in Apothecaries Shops. Its Root is round and not flat, of a brown color, and not fo black on the Outside as some of the others. It has many Leaves forced upon the Ground, rising from certain small long heads, which grow from the greater round Roots, as thofo of the following do, being in like manner with them folded together, and afterwards spread themselves into round green Leaves, something like in the Leaves of Atium, but not shining, without any white flecks (for the most part) on the upperfide, and red or purplish underneath, and very fold-

dom greener. The flowers stand upon small foot-

flaks, and show themselves open for the most part, before any Leaves do appear, being smaller and flonder than those with the hay Leaves next following, and of a pale purple color, yet some-

what deeper, hanging down their heads, and turn-

ing up their Leaves again, at all the others do, but more forces than any of the Autumn flowers.

After the flowers are past, come the Beads, turn-

ing or winding themselves down in like manner as the others do, bearing flowers like Seed as they have, but somewhat larger, and more uneven, or at least not so round.

Sowbread Common.
Leaves, like unto Acorbaceae, being that the upper part of the leaves are sometimes mixed here and there confusedly with white spots, and under the leaves meet the Ground of a purple color. Among which rise up little Scionts like unto the bract of Petrus, bearing at their tops small purple Flowers, which themselves back, and being fall blown, are in form of a Turkish Cap or Tulip, having but a small stalk, or almost none at all, which being pull'd, little round Knobs or Heads increas'd, in which are contained slender brown Seed. These kinds are week'd after a few days in the small Stalks, as thread about a button, where they remain so defended upon the Ground, from the Injury of the Winter cold, covered also with the green Leaves aforesaid, by which means it is kept from the Frost even from the time of its Seeding (which, is in September) until June, at which time the Leaves fade away, the Stalks and Leaves remaining bare and naked, whereby lasting the power of the Sun upon them, they are the Flower brought to Nature.

V. The second, or Ivy Leav'd Sow-Bread. Its Root grows to be great, being round and flat, and of a blackish brown color on the outside. Several of the Leaves are greater than the common round Sow-Bread, somewhat larger than the Roman or Italian Sow-Breads, and of a Paler purple color, almost black, without that Sweet Scent as it is in the next following. The greater Leaves herof, more or less Purple underneath. All the Leaves and Flowers do stand usually every one separately by themselves upon their own slender stalks, as most of all the other kinds do. But sometimes it happens that both Leaves and Flowers are found growing from one and the same stem, which I take rather to be Accidental than Natural, so to continue. The Seed herof is like the Seed of the other kinds, which being Sown produces Variety, both in the form of the Leaves, and color and smell of the Flowers, some being taller or deeper, and some more or less sweet than others. The Leaves are some of them more or less corner'd than others.

VI. The third, or Spring Sow-Bread Purple Flower'd. This has a smaller Root than most of the others, yet round and blackish on the outside, as all or most of the rest are. From whence rise up divers round, but pointed Leaves, and something corner'd withal, green above, and spotted with white spots Circletlike about the Leaves, and reddish underneath; which at their first coming up, are folded together. From among these come forth the flowers, of a reddish purple color, and very sweet, every one upon a small, long, slender reddish yellow stalk, which brings forth the round heads, turn up their Leaves again. After the Flowers are pull'd, the Head or SeedVelvet or bright, winding its Pennate, and Coiling itself like a Cable, which when it turn'd around the Ground, besides this, hid among the Leaves, till it is grown great and ripe, in which are contained a few round Seeds, which being perfectly Sown, will grow forth into round Roots, and afterwards from them, flower forth Leaves.

VII. The fourth, or Spring Sow-Bread white Flower'd. This is almost in all respects like the former, the chiefest differences being in its Leaves, which though they are much like the last described, yet are not so fully so much corner'd: the flowers are also small, and Snow White, being still but a little or no scent as the former Purple flower'd.

VIII. The fifth, or Roman round Leav'd Sow-Bread. Its Root is round and Black, and not so flat as some are, but growing sometimes to be greater than any other kind of Sow-Bread. It has round Leaves, something like unto the first or Common Sow-Bread, but not fully so round pointed at the ends, a little corner'd, sometimes also, or as it were indented, with white spots round about the middle of the Leaves, and very conspicuous, which makes it seem more beautiful. The Flowers come forth in Autumn, and are shorter, and of a deeper purplish red color, than the Ivy Leav'd Sow-Bread, rising up for the most part before the Leaves, or at least with them, and little or nothing Junceus. There is sometimes some Variety to be seen both in the Leaves and Flowers of this kind, for that sometimes the Leaves have more corners, and are either more or less spotted with white. The Flowers are likewise some larger or lefser, some longer or rounder, and some paler or deeper colored one than another; which happens very likely from the Sowing of the Seed, and quality of the Soil, as is oftentimes also seen in the Ivy Leav'd Sow-Bread. The Seed of this, (as of all the rest) it is small and round, contained in such like heads as the former, standing almost like the head of a Scale, which is round or folded within the Body thereof. This and the other Autumn kinds, presently after their Sowing in Autumn, shoot forth Leaves, and so abide all the Winter, according to their kind.

IX. The
There are some few other Species of this Plant, which though not common, yet because they are to be found in the Gardens of some curious Florists, we shall adventure to add in this place.

X. A seventh Species. Cyclamen verum. Concerning this species, see the former; it is, as there described, double, round Leaves like the Roman Sow-Bread, but somewhat smaller, yet with shorter corners than the large Icelvd Sow-Bread’s; its foliage resembles the leaves of the Lentis, and very purple underneath; sometimes they have fewer spots, and little or no Purple underneath. The flowers are small and at Purple, and as flowers of the purple Sow-Bread of the Spring, at See. VI. are following.

<tr>
<td>XXIII.</td>
<td>The Liquid Juice of the Root or Herb. It opens the Hemorrhoids or Piles, and strongly moves to Stool, being put up with Wool or some Fitch like, as a Suppository. And a Clyster of Mistletoe fays, it causes tough Flegm to be avoided. It is also mixed with such Medicines as diffuseth Soothings, Kernels, and other hard Knots, in any part of the Body; and Snuf- fed up the Neftrils as an Eriugine, it purses (as the fame Miftefe fays) the Head and Brain from evil humors which offend it, it effeals also the Head and the Migrain. Galen fays, that in his father fays, that if the Belly be Bathed with the Juice, it will forcibly move it downwards, and Kill the Child in the Womb.</td>
</tr>
<tr>
<td>XXXIV.</td>
<td>The Decolation in Water. It has the former Virtues, but much weaker: It heals Wounds and running Sores in the head, exes pains in the Bones, and strengthens Limbs out of Joint. It is fad able to cure Chills and Chills, and give relief in the Gout.</td>
</tr>
<tr>
<td>XXXV.</td>
<td>The Garascarum. It is made of the Juice, 4 Ounces mixed with Honey an Ounce, by disfighing or seating the Hony in it. It draws Rheum and Humors from the head and parts adjacent, gives cache in the Tooth-ache, and heals Sores in the Mouth and Throat.</td>
</tr>
<tr>
<td>XXXVI.</td>
<td>The Otalgick. Let the Root be beaten with Peacchstone Reuffles, and Bitter Almonds, and then Beeked in a little Bandy for three days, after which peeks out the Must or Cream. Two or Three drops of this Beeg put into the Ears which are Deaf, or have a great Noise in them, gives relief after a short time of using it.</td>
</tr>
<tr>
<td>XXX VIII.</td>
<td>The Powder of the Root. The Root either drank in Poudc, or used as a Puffery, provokes the Terms in Women, and is profible for fuch as have the Yellow Jaundice, driving the difeafe forth thro' the Pores of the Skin. It may be given from 2 Scruples to a Dram, or Dram and half, in Meat, or Holedwater, and so it purges downwards tough and profes Flegm; and other Sflar Humors. Taken in Wine it is fad to be profible againft all forts of Polion, and the Bittings of Venomous Creatures, being also outwardly applied to the Part, and taken inwardly in White Port Wine, it opens obstructions of the Liver and Spleen, and helps fuch as are Parly and fhort winded; but fome fay it ought to be correfted with Powder of Miffieh or Nymeg, which hindereth his Violence in punging, and thereby many have had help of the hardness and dwelling of the Spleen, which could not be relieve by the effect of other things. It gives ease also in the Colic, Belly-Ach, and other Torments of the Bowels.</td>
</tr>
</tbody>
</table>
| XXXIX. | The Ointment Compound, called Unquagmarum de Amanda. Take Juice of Bow-Bread 3 Pounds. Oil of Olive 2 Pounds, fresh Sarspar- lla Batter, Juice of Wild Cumarbus, and, 1 Pound; Polypodium 6 Ounces; Pulp of Caloponatum 4 Ounces: Euphrasia half an Ounce: The things
to be bruised being bruised; let them be steeped in a Glosed, Vjejel close that 12 days afterwards boil them in a double Vjejel, till the juice is almost consumed, then pour out the Liqueur, and digest thereon Yellow Wine five Ounces: and swollen worm mix with it Saffron dissolved in Vinegar, Bufl Cell abated to the thickness of Penny, and an Ounce: Then put in these things following in Powder, Sumcnmy, Turkey, Clove-pins, Aceraron Briees or Leaves, Alces, and, 3 Drabs: Sulphur half an Ounce: Ex- plotum, long Pepper, Myrhh, Ginger, Cormil flowers, and, 3 Drabs, mix and make an Orna- ment. It purges by anointing it upon the Stomach and Belly, and therefore is good for such as cannot take Purges by the Mouth; and fole ufed it good against the Dropley, because it plant- fully evacuates the Watery Humor. So anoint- ed it also Kills Worms, and drives them out. And mixed upwards to the Pit of the stomatch it caules Vomiting. It is a strong kind of Purge, and doubles is of extraordinary service in curing such as have the Dropley, for the reason before Specified.

XLI. The Poyfary. It is made either of the Green Root, or of the Pouter of the Root. It strongly provokes the Terms, endangers militia- rage, facilitates the Birth, brings away the After- Birth, and forces away the Dead Child.

XLII. The Cataplafm. The Root made into a Carapalam with a little Honey, and applied, draws forth Splinters and Thorns out of the Flesh, and gives ease in the Pains of the Gout.

XLIII. The Distilled Water from the Root. Mathioli says, that being Smurfed up the No- flowers it wonderfully plays their Stealing, and that if fix Ounces of it be drunk sweetened with an Ounce of fine Sugar, it will stop any Flux of Blood from the Vfeters, as Stomach, Lungs, Liver, &c. after an admirable manner, yea the fome Vjejel or Vein be broken. If two Ounces of the Water is mixed with four Ounces of the Juice, and the Skin be Bathed therewith, and ridden to dry in, it cleanses it, takes away Freckles, Pimpls, Scurf, Tanning, Sunburning, and all other deformities thereof.

CHAP. DCXLV.

OF SOW-THISTLE.

I. THE Name. It is called in Greek Ξένλος (τὸς εὖν γνώμων γονωθεὶς Τραχεῖος χαρά- κεύς) in Latin, Sonchus; and in English, Son- thistle.

II. The Kinds. We make but two principal kinds of this Plant, viz. 1. Sonchus Levii, The Smooth Sow-Thistle. 2. Sonchus after, The Prickly Sow-Thistle. Of the rfs Species there are several sorts, of which these are chief, viz. 1. Sonchus Levii vulgaris, Ladorea Leviii A- palata, Bifclus Levii, Ladorea being ac- counted for by some as a kind of Wild Laxatif. Impyus Sylvestris five ernezcus Tragos, Estrica Sylvestris Tragos, Estrica Sylvestris Lonicere, Andrubus minor De- lechampii, Sonchus Levii feu Levii Cordi, Son- chus Levii after, Sonchus vulgaris, Sonchus jovis Lucas, Our Common Sow-Thistle, 3. Son- chus Levii alter, Sonchus Levii florisbus parvis, Sonchus Levii alter profundis Lacinia Simi-
The Descriptions.

I. Of the Smooth Kinds.

IV. The first, or Our Common Smooth Sow-Thistle. Its Root grows downright, and has many Fibres adjoining to it, persifling every year, and rising it self from the Sowing of its own Seed every Spring. It is a plant well known, and rises up with a round hollow Stalk, two, three, and sometime even four Feet high, if it grows in good ground, or in Gardens, as usually it does, set with many long and much torn LeAVES, of a whitish green color, not having that roughness, or those sharp prickles on them, which are in the Prickly Kinds. It Branches forth towards the Top into divers arms, all which bear pale yellow Flowers, which pass away into down, which with the Seed are carried away with the Wind. The whole Plant being cut or broken, gives forth plentifully a White or Milky Juice, which is more pleasant than that of the Prickly Kinds, and not so bitter.

V. The second, or Our Common Lesser Smooth Sow-Thistle. The Root of this is like the former, and it grows much like it, but not so high, nor has it so many Leaves set on its Stalk, but they are long and more torn on the Edges, else not unlike to the foregoing. The many Branches of the Stalk have fewer and smaller leaves. The flowers are like, but much smaller than the full.

Sow-Thistle Smooth small Common.

Sow-Thistle narrow Leav’d.

of the same pale yellow color in small, which passing into down, with the Seed are blown away with the Wind. And the whole Plant has the Juice, or like Milky Juice with that.

VI. The third, or Broad Leav’d Sow-Thistle with White Flowers. The Roots, Stalks, and
Leaves of this are like the leaf, but the Leaves are something larger and broader, with fewest rents, cuts, or divisions on the Edges, the flowers hereof are like in form, but white, which with the breadth and magnitude of the Leaves, make the principal differences. The Root and other parts of the Plant are milky, and the leaves are great, smooth, green of color and sharp pointed. And Johnston in Gerard says, that the flowers of this are for the most part yellow like as the former; and indeed all that ever I have yet seen have been of the yellow color, nor ever found any of them which tended to white; though possible in some other foreign Countries and Climates they may be really white.

VII. The Fourth, or Narrow Leaf'd Sow-Thistle. Its Root is long and slender, and grows milk, as the whole Plant does before. It has but few Leaves, and thick very long and narrow, whose lower parts are narrow, and have no incision at all: but from the middle almost forwards, they are broader and have divers Gloses on both sides, greater and deeper, and others smaller, equally towards the ends where they are broadest. The Stalks grow something long, and spread out into but one or two branches, which are set spirally with Leaves, the uppermost whereof are long, but not divided, or very little, and encompass the Stalk at the root, which bear one large yellowish flower, upon a long forked top branch, which being ripe, with the Seed by away with the Wind.

VIII. The Fifth, or Great, or Tree Sow-Thistle. Its Root is great and whitish, accompanied with many great Fibres or firings, not perforing in the Winter but emerging every year. It grows to the height of a Man, with a strong Stalk,

Sow-Thistle Tree, or Great.

X. The Fifth, or Greater Prickly Sow-Thistle with whole Leaves. Its Root is long, yellowish, and somewhat hard when its grown up with a Stalk, having a number of small Fibres adjoining to it. Its Leaves are something long and broad, of a whiteish green color, unequally divided, but not so full or torn on the edges, and every dent set with a sharp prickles, somewhat hard, and sometimes prickly also along the middle rib, on the under side, yielding a more bitter Milky Juice in every part, when cut or broken, than that of the smooth kind. The Stalk is hollow, somewhat tender, and in it sits a nimble, with a Film running upon it, rough and pricky, set with such like leaves, as grow below, directly branched, with small pale flowers growing at their Tops, which turn into Down and are blown away with the Wind.

XI. The Second, or Lesser Prickly Sow-Thistle. This is in all things like the former, but less in every part, having a round Stalk, seldom above.
above a foot high, somewhat fatter, and not so tender, nor so succulent, but as sharp and prickly as the former, which are for the most part white, and not rent or divided.

XII. The third, or Our Common Prickly Sow-Thistle. Its root is like to the others. Its leaves are very much cut or torn on the edges into three or four parts, much separate from one another, and smaller pieces of leaves set between them, of a whitish green color like the former, and having prickles on the dotted Edges likewise. The stalk grows very high sometimes, also rough and prickly, with such leaves thereon, as are below, branched at the Top, on which grow many pale yellow flowers turning into down.

XIII. The fourth, or Greek Prickly Sow-Thistle. Its leaf leaves are little or nothing divided on the edges, of about an hand breadth long or more, but those which rise up with the Stalk, are very much torn in, into great and deep gashes, set with some prickles likewise. The Stalk is rough, bristled and bulled, half a yard high, branched from the middle upwards, with such like leaves, set at the joints, but smaller. At the Tip stand large yellow Blossoms, in rough green burs upon long Footstalks, which convert into down as the other do.

XIV. The Places. The first four grow in Gardens and Manured Grounds, and also in Follow Lands and Fields, and sometimes by Old Walks and path sides of Fields, and High ways. The fifth and sixth, grow among Willows and Reed, and sometimes by Old Walls, and Places of Rushes, not often frequented, and many times in our Gardens. The Prickly Sow-Thistle grows in unmanured as well as in manured Soils, also in Pastures, Meadows, Woods, Ditch sides, and moift Grounds, in Orchards also and Gardens, where the Leaves are usually lefter, and leffer divided, than in the rough and unmanured Grounds. The last grows naturally in Candy, and as I am informed has also been found growing in England, in several places.

XV. The Times. The first four Smooth ones flower quickly after they are sown up, for it is but before they rise out of the Ground, and continue flowering till August. The Tree or Great Sow-Thistles flower in July and August. The Prickly kind sows flower and seed their Seed from the middle of June till all the Summer long, and sometimes even to the end of August.

XVI. The Qualities. They are cold and dry in the first degree, Anodyne, Deobstructive, and Diuretic, Palmitonic, Stomatetic, Nepctic and ulcerific.

XVII. The Specification. They cure Naufeousness at Stomach, and want of Appetite, Obstruction of the Lungs, the Nerves of Breath, and difficulty of breathing, help a Stinking Breath, provoke Urine, and are profitable against Stone, Gravel, Sod, or Tartarous matter in the Reins, Ureters and Bladder, causing the Stomach, Laxate the Bowels, and cause speedy and easy Delivery to Women in Travel, ease pain in the Ear, help the Hemorrhoids if Piles, take away Worms, and by a Colicinetic property cleanse the Skin from molt defecations usually attending it.

not, or exculpate the Entrails of Sheep if they eat it, and kill them.

This same will have to be the true *Apium rigor*, or *Apium Sardonium*, whilst others are of another Opinion, taking it to be a kind of *Puflatila* or *Puflatilier.*

The Descriptions.

III. The first, or Greater Spearwort. It has a long jointed Root, found with many blackish Fibres, from whence rise up a thick jointed smooth Stalk, two feet high, furnished with large and long shining and smooth Leaves, thinner than those in the next; some of them, being more than half a foot long, and two or three inches broad, but smaller up towards the top, where bend a few pale yellow Crown-feet like flowers, but larger than in the others.

IV. This Plant Gerard describes thus. Its Root is compass'd of divers bulbs, or long joints mixed with an infinite number of hairy Thorns. It has a hollow Stalk full of Knees or Joints, on which do grow long Leaves a little hairy, not unlike those of the Willow, of a shining green color. The flowers are very large, and grow at the Tops of the Stalks, consisting of five Leaves, of a fair yellow color, very like to the Field Gold Cup, or Wild Crowfoot. After which come round knobs or Seed Vessels, in which the Seed is contained.

V. The second, or Lesser, which is Our Common Spearwort. Its Root consists of an infinite number of Strings, but in its Stalks, Leaves, and Flowers it is much like the former, finding that it is altogether leffer. Its Root is nothing but

Spearwort Common or less.

Spearwort Greater.
a Bough of Fibres or Twigs, which grow and
run deep into the Mud. It grows up with a
greater store of finely green Stalks, with thicker,
more, and larger pointed Leaves thereon, and a
greater store of pale yellow flowers, like
to those of Cuckoo, and the Violets, Knobs or
Seed, are also like to those of the Cuckoo.

VI. The third, or Sawlike Speedwell. Its
Roots consists of a great number of hairy Stalks.
It is about like the last, having that this is
oftentimes found, having the Leaves and about
the Edges, in more plenty than in the oth-
er, because both of them are often seen, the
plain with some dented Leaves, and the dented
with some plain Leaves among them. Its Stalks
or Staths, are thick, fat, and hollow, de-
viling themselves into divers Branches, on which
are a few sometimes by Couplex two long Leaves
short pointed, and cut in about the Edges like
the Teeth of a Saw. The flowers grow at the
Top of the branches of a yellow color, in form
like those of the field Cuckoo.

VII. The fourth, or Marth Speedwell. Its
Root is like the former, and it has such like
long Leaves as the older Speedwell has at Sect. V.
above, which grow upon long Footstalks, but def-
fier and narrower by much. The Stalk is bare
without Leaves, facing that at the Top where
the flowers break forth, it has no small long
Leaves. The flowers are slender than those of
the common small sort, but pure white, the
Knobs and Seed being also white. There is a
mother sort of this kind, which we have had
from Baygen in the Bay of Biscay, which grows
in their Marshes near the Sea Coast, whose
Roots are like the former, Stalk Branched, Leaves
long and narrow, and sharp pointed at the ends,
bearing larger yellow flowers than the former

VIII. The fifth, or round Leaf'd Marth Speed-
well. Its Root is a Bough of small white Stalks
growing in the Waterish Alres or Mud from which
shoots forth a Stalk, rounded and hollow, about half
a yard high, spreading it up forth into several
Branches, the lower Leaves of which are rounder
than those above, and are disposed much like
to those of Dowe Foot, or Cut Alson, but some-
ting greater, of a bright shining color. These
Leaves are divided some into 3 parts, which are
the first and last, and others which are higher
on the Stalk, into five divisions, and each of
these divided about the edges, somewhat like an-
not to Cloverhead Leaves, which are smooth, and of
a paler green color. Those which are yet higher
on the Staths and Branches, are still more
and more divided, and none of the highest, have no divi-
sion or Dent in them at all. At the Tops of the Staths
and Branches stand small yellow flowers, like
to those of Water Cuckoo (but Cordus says that
he has observed none to bear Purplish Flowers
which) after which come small long round heads,
in which many Crooked Seeds are set together,
as in the other sorts is to be seen.

IX. The Pinks. They all grow in Moorish
and Wet Grounds, and sometimes by standing
Waters, Ponds and Ditch sides, almost every
where. The sort is more scarce to be met
within, but the two next are plentifully enough
in many parts of England. The two last are
not so common, but are also to be found in
Marth and Wet places, in several parts of this
Land.

X. The Timers. They flower in May, June,
and July, and give their Seed in June, July
and August, or soon after.

XI. The Qualities. It is hot and dry in
the fourth degree, rates Blitters, and being taken
inwardly kills without Remedy. It opens
Aphorns, is probative against Rooted and Putrid
Ulcers, drawing out the matter. It is said to
be good against the PaUcy, and help
Quarantin, as Paracelsus, Dodomus and oth-
ers say. And the leaf or round Leaf'd sort
as sharp and Virulent, as any of the other
kinds. They are in Faculties and Virtues like
to the Water, field, and other Cuckoo, whose Spec-
ification, Preparations, and Medical Uses, see in
Chap. the XVII., Sect. XXVII. and XXXIV. aftergoing
of this Book.

CHAP. DCXLVI.

OF SPEEDWELL:

OR,

PAULS BETONY.

I. THE Names. It has no Arabic nor Greek
Names, but is called in Latin, Veronica, Veronica Pauli, Veronica
Mas: in English, Speedwell, or Pauls Betony.

II. The Kinds. The Authors make two kinds her-
col. viz. Mas & Femina. The Mas or Male
kind is called Speedwell, Pauls Betony, and by
Dodonarius, Betonica Pauli Aegrotat: of which
in this Chapter. The Femina, or Female kind
is called Paulina. and Elatina, of which we have
already Treated in Chap. 295. aftergoing of
this Book, this being another Herb, of a differing
form (as Parshing says) from Speedwell.

III. The Kinds of Speedwell. The Authors make
at least half a Score Species thereof, but
most of them growing on the Alps, and in
Austria, Mount Baldaus, Hungaria, Syria
and other Foreign places far distant from us, I shall
overspans them, and only Tast of such as grow
in England, which are the two following, viz.
1. Veronica, Veronica Vulgaris Verona Mas,
Veronica Mas Vulgaris, Veronica Pauli,
Betonica Pauli, Tencium Tragi, Our Common
Speedwell.
2. Veronica minor, Veronica patens-
facic minor, Veronica minima, Our small
Speedwell.

The Descriptions.

IV. The fifth, or Our Common Speedwell. It
has a Root running under Ground, and con-
stituting of many Fibres. It rises up with divers
five Leaves, of an hairy green color, a little
dented about the Edges, and somewhat hairy
all, by jointed at the joints of the hairy
branching Stalks, which lean down to the Ground,
never standing upright, but shooting forth Roots
as they lie upon the Ground or upon joints.
The Flowers grow one above another as the Tops
being of a blemish purple color, and sometimes
of a white color, after which come small flat
buds in which is contained small blackish Seed.

V. The second, or Our small Speedwell.
Its Root is Woody, creeps with small Fibres

1064

Salmon's Herbal.

Lib. I.
Speedwell Medow Small.

Small blue flowers, succeeded by very small brownish Seed, in small Seed Vessels. Germs says at the Tops of the Stalks or Branches come forth slender Spikes, closely thrift together, and fall of breath flowers, which are succeeded by many armed Seed Vessels.

VI. The Places. The first grows almost in all parts of England upon dry Banks and Wood sides, but more especially upon some sandy French Grounds; in Borders of Fields, in Woods and on Grassy Mole Hills, almost everywhere. The second is more scarce, but has been found in a close by Lynn near London, and in several other Places: I have formerly found it also in some Meadow Grounds near Lynn Regis in Norfolk.

VII. The Times. They flower all June and July, and sometimes in August, and their Seed is ripe in July, August and September.

VIII. The Qualities. Speedwell is temperate in respect to heat or coldness, dryness, or moisture, but is said to be a little inclining to dryness. It is Aperitive, Ablative, Coffinative, Drauretic, Vulnerary, Pelcoral, Stomachic, Nephritic, Sudorific and Alkaliurarum.

IX. The Specification. It prevails against the Stomach and Liver of all kinds. And according to the constitution of the Blood and humors, opens Obstructions of the Stomach, Lungs, Liver, and Reins, prevails against old Coughs, Ulcers, and Inflammations of the Lungs, and other Diforders of those parts, is an excellent Antidote against the Measles, Small Pox, Pox, Purules, Malign, Spotted and Pelilential Fears, and the very Plague or Pestilence in Egypt, it also prevails against tertian Old Sores, confirming or eating Ulcers, speeding Ringworms and Tettars, malign herpes, and other like Dilemmer of the external parts.

X. The Preparations. You may make therefrom.

The Virtues.

XI. The Liquid Juice. Drink to the quantity of four Spoonfuls morning, noon and night, either alone, or mix it with distilled water, it is good to cure the Lepry. It is reported that a French King troubled with the Lepry, was cured of it by the use of this Herb, being advised thereto by one of his Huntsmen. It wonderfully helps the Memory, and all Giddiness or Swimming of the head, and cures the Head-ache. It is said also to make Women fruitful which are barren, and cleans the Blood from impurities: taken with a half part of Honey dissolved in it, it is good for all manner of Coughs, Cataracts, and Discharges of the Breast and Lungs. This thing has been proved by Shepherds, who give this Herb with a little Salt, to their Sheep which are troubled with the Cough. It opens obstructions of the Liver, and Spleen, and prevails against the Yellow Jaundice, being taken for some time together, and a Cataplasia of the Herb with Vinegar applied to the Region of the Spleen curatively. It curés Ulcers of the Reins: Bladder and Uterus, or any other inward Wound or Ulcer, provides Urine, and helps such as are troubled with the Stone. Paulus Agresta says, it is of good use for discharges of the Back and Reins.

It is of good use to heal all simple Green Wounds, at first intention, and is no less effectual against spreading Tettars, and breaking the Teeth, and Running Sores and Ulcers which have been of long continuance and are hard to be cured. It stops the bleeding of Wounds, and all other Fluxes of the Blood in the part, and dissolves Tumors or swellings, chiefly those in the Neck, &c.

XII. The Essence. It has all the former Virtues, but much stronger, and may be daily given as the former, from two to three Spoonfuls in any convenient Vehicle.

XIII. The Composition in Wine or Water. It has all the Virtues of the Juice and Essence, but is much weaker, and therefore may be given from four to eight ounces at a time; it is truly an excellent Vulnerary.

XIV. The Powder of the Herb and Flowers. It has the Virtues of the Juice and Essence, but fails not with that speed and facility, because it is fit to be digested in the Stomach. It is a singular thing against the Plague, all Pelilential and Infectious Disses, to defend the heart and expel their Poison and Malginy, to corrode the head and Stomach, and preserve them from Noisiness and Infectious Vapors, being daily given morning and night a Deem or two at a time either alone, or mix with a Deem or two of White Vinegar or Mithridate, in a small draught of Wine, and so laid down to sweat upon it.

XV. The Gynecom. It is made of the De- perated Juice mixed with an equal quantity of the Distilled Water. It clears the Skin from yellowness, Sun-burning, Tanning, and other dis- colorations thereof. And if White Vinful or a Deem to a quart of the mixture be distilled in it, it is admirably good against Seals, itch, Scurfy, Morphew, Tettars, Ringworms, and all other defections of the Skin.

XVI. The Balsam or Ointment. The Juice or Essence being daily taken inwardly, and either of these used outwardly, they heal all simple Green Wounds, many times at the first Intention, and digests, cleans, internal, and outward all Putrid Ulcers, and other running Sores in what part of the Body soever.

XVII. The Cataplasia. It is made of the
Green Herb, and is of singular good use to heal all simple Green Wounds, in what part of the Body they are, to take away hot and sharp hurts, difficult Contusions, &c.

XVIII. The Spirituous Tincture. It is good against Fainting, Swoonings, indigitation of the Stomach, Sicknefs at heart, and other indispositions of the Vifera, and has all the other Virtues of the Liquid Juice or Eflence. Doze: 2 Drams to 4 in a Glass of Wine, morning and night, or at times of the Deliquium.

XIX. The Acid Tincture. It is an incomparable thing against the Plague or Pelifence, and all Pettytential or Infeclious Diseases, as Mealls, small Pox, Calenture, Purple, Spotted Fever, and the like, it strengthens and fortifies the Stomach, refills purity of the Blood and JUices, caules a good Appetite and strong digestion. Doze so many drops as may give a Glass of Wine, or other Vehicle, a pleasing Acrify.

XX. The Oily Tincture. It is a singular thing to open Obftructions and cleanfe the Blunts, Urine and Bladder, of small Stones, Gravel, Sand, and Turdices matter lodged in those parts, to give ease in the Strangury, and help pains and weakneffe of the Back, &c. Doze a gut. xvi. ad xxx. in any fit Vehicle.

XXI. The Distilled Water, simple or distilled from Wine. It has the Virtues of the Juice, but in a much inferior degree, taken inwardly sweetned with Honey, or Sugar Candy, it is good against Coughs, Colds, Confumptions, and other Diseases of the Lungs.

XXII. The Spirit. It is Stomachick, Cordial and Alexipharmacick, good against Fainting, Swoonings, Palpitation of the heart, Sicknefs at Stomach, Celtick, and other inward pains of the Bowels. Doze from 2 Drams to 4, in a Glass of Wine.

CHAP. DCXLVII.

OF SPIKNARD EUROPEAN.

I. THE Name. It is called Greek Nardos, and in Latine, Nardus Celtica, Nardus Sperum, and Pyciustrum: in English, Celtick, or European Spiknard.

II. The Kinde. Authors have given us almost half a Score Sorts, of this Plant: we Hall only relate thefe which are most common, and fhall be here dealt with; which are, 1. Narthus, Nardus Celtica Differta, Spica Celtica, Nardus Galliicum Gafalpin, Mountain or Celtick Spiknard. 2. Nardus Somnus, Nardus Montana, Nardus Celtica Chaff, Spica Celtica Marath, Nardus Celtica altera. The other Celtick Spiknards. 2. Nardus Montana Tabernat, Tuberous Mountain Spiknard. 4. Nardus Sperum Norvencis, Nardus Gallica, Nardus Spurum Gallica, Nardus Gangavis (from the Town Gangae near which it grows in France) Ballard French Spiknard.

The Descriptions.

III. The fifth, or Mountain or Celtick Spiknard. It creeps upon the Ground under the lower Leavés and Mofs, both small, long, and hard fender Roots, (which ought to be so called rather than Stalks) in which confines the whole Virtue and Eflence of the Plant, and are only used (by the best Apothecaries) in Materia, and as part of the Plant eafe. Thife Roots are covered with many short, small, dry Leaves like Scales, and fend forth in divers places of the Root and Stalk, horne and there, small blackish Fibres into the Earth, whereby it is nourished. At the head or heads of which came forth several small buttons, or heads, from whence spring many small, unILINE, and somewhat thick green leaves, not divided or divided at all, which are round left at the bottom and broad towards the end, and change yellow in the end of Summer or begin ning of Autumn. From among these Leaves rise often times more, and sometimes but one fender stalk, without any Leaves thereon, at the Top whereof stand many small uniline Leaves, like unto the smaller sorts of Valerian, every one in a fender footflake, which afterwards yield small Seed like to them also. The whole Plant is sweet and Aromatical, more than the Indian Spiknard, better alfa, and sharper in Taste.

Spiknard Celtick.

IV. The second, or other Celtick Spiknard. This in its Roots, Fibres, Leavés, Stalk, Flowers, and Smell, differs nothing from that fift described, but in its Stalk of Flowers, which in this is branched towards the Top, bearing three or four Flowers together in a Tufft, at the end of every small branch.

V. The third, or Tuberous Mountain Spiknard. Its Root is Tuberous of Knopped both above and below, and round about, with some Fibres fooning from them, by which it is increased, and fiumally very like the Root of the Garden Valerian or Stew nell, yet not altogether fo strong being green, as when it is dry. This kind of Spiknard or Valerian (call it which you will) has its fift Leaves lying on the Ground, even without any Division in them at all, being smooth and of a dark green color, which fo shade all the Winter, but rofe which forcing up afterwards upon the Stalk when it runs up to flowers, and are among the Edges, like unto the jagged Leavés of the great Garden Valerian, and fo the older.
chap. 47. English Herbs.

Of Indian Spiukard, they have found some which had the parts of Fibres, Heads, Roots, and Leaves distinctly to be seen, as this is here described, which makes it out of doubt, that this French kind, is a Baffred Species of the Indian.

VI. The Fourth, or Baffred French Spiukard. This Plant grows in form, (in all its parts almost) like to the true Indian Spiukard. It has a few small hard Fibres, which threfh themselves into the Ground, from which spring forth several hairy round fferc heads or beads, of the bignes of one finger, and of a hard thick body, of a pale brown color, which are not painted at the Tops, but flat, or blunt, through each of thofe heads, even from the lower part near the Root, which grow forth divers long, rough, green Rofhes, scarcely a foot high, many of them growing close one to another, fo that they make the form or face as it were but of one Plante, which are likewise fad to be together without fmall, except thofe hairy fperc heads or Beards, which being larger than the Indian kind, do fmall fomething like to the Spiukard growing upon Oak Trees, or that other which grows upon the Ground. These heads being half way in the Ground, do fand forth each of them in the middle of fme Rigif Rofhes, a tall Rofher and smooth Stalc, rifing about a Cufh higher than the Rofhes, from the middle whereof up to their Tops, on each side, come fome many fmall, Green Cofes, pointed at the ends, fluming to Caps, like to thofe of Granes Miff, The whole form fhereof does fo nearly re-semble the true Indian Spiukard, as Ferris, and others have obferved, that among a number of bundles

The Virtues.

XII. The Infuflon or Decoction in Wine. It flops fluxes of the Bowels, but provokes Urine, is Stimulating, and good againft loathing of Food, or Nauftalniae, gnawings in the Stomach, fick-nes at heart, and Wind opprefling the Bowels. The Decoction in Water used as a Bath, is good againft Fits of the Mother and weaknethes of the Womb, drying up fuppers in three parts. The Infuflon or Decoction in Wine with a quarter part of Wormwood, is a molt excellent Stimulating, provoking against the Colic, want of Appetite, &c. Ill-Digiflition, Vomiting, &c. To be taken of a Piut at a time, morning, noon, and night.

XIII. The Powder. It may be given from a Scapule to a Dram, with a Drop of Hony, or any other convenient Vehicle, and has all the Virtues of the Infuflon or Decoction. It is a fingular ingredient in Mifhrac, that chiefly made of the fmall Species, for tho' the Indian Spiukard is al-ways intended here, yet when that cannot be had, this fmall kind always supplies its place. It is fad to be good for fuch as are Liver-grown or have the Rickets, and also for the yellow Jaundice, Bloody Flux, and the afling or biting of any Venenous Creatures, as abo to expel poifon, being inwardly taken. Sniff up the Noftries, it exce-lleatly purges the Head and Body.

XIV. The Infufloned or Decocted Oil. It is warming, Anodyne, and comfortable to the Nervous parts. It makes thick and curarized humors, digests those which are coarse, and moderately affranges and strengthens the parts which are feeke.
and weak, and is said to be probable against
Trendlings, Palies, and the like.
XV. The Spiknard Tincture. It has the Virtue
of the Infusion and Distillation, is good against
malign Fevers, and the Pallion and Infusion of
the Plague or Pestilence, and all Peltisant Dis-
tempers; it comfons the Head, Brain, Nevers
and all the Vifera, Chiefly the Stomach and
Heart, warms, digests, fans thin diluflions of
chickm, eafe paines proceeding from cold, as al-
to the Stick, and is probable against Palies, Con-
vulsions, Crampes, &c. Dofe from one to two
Drams in a Glafs of generous Wine.
XVI. The Acid Tincture. It is a pleasant thing
against all sorts of hot Burning Fevers, and more
efficient than the former against all sorts of ma-
lign Fevers; the Plague, and all kinds of Peltisant
Diffecles, besides fubduing the destroying the
Pallion, it takes off (as it were upon the spot) the
praductual heat, and refounds the Sick to their
natural temper. Dofe fo many drops as to make
the vehficle perfuam, and to be repeated as often as
the Patient drinks.
XVII. The Oil Tincture. It is a good against
the Colick and Griplings of the Guts, Pain and
weaknefs in the Back and Reins, the Strangury,
the Stone, Gout, Sand and Turbuloft matter in
the Bladder, and other Urinary parts. It comfons
all the lower Vifera, and is of singular good eflect,
against Trendlings, Palies, pains and weaknefles
of the Nevers and external paffions proceeding from
Cold, over-powering of the Limbs, or any other
external hurt, or defcifions of Cold humors from
other parts; it is good to difolve Nodes, and other
hard swellings, and is probable againft Diffecles
of the Spleen, Reins and Bladder. Dofe good.
adv. 1/2. or more drop into Sugar, and then mix
with any convenient Vehficle.
XVIII. The Difflufed Oil. It is anttiparalytik,
almost in the least degree, and a potent medicin-
mage against trembling of any part, weaknefles of
the Nevers and Tenions, Crampes, Convulfions,
and other like Diffecles of the Neurotic parts,
as the Stomach, Bowels, Melentery, &c. giving
cafe in the Colick, and other inward pains, Fits
of the Mother, Fainting, Swooning, &c. almost
in a moment. Inwardly it may be taken morning
and night from 1/3. to 1/2. or xx. drops, in any 1st
Vehicle. Took some white Bread very hard and
then pouder it, drop this Oil upon it, mix them
well together, and then with the Vehficle you in-
stead to give it in, and so let the Patient drink it.
Outwardly anoint it upon the Back Bone, and the
other Parts affected twice a day.
XIX. The Difflufed Water. Let the Grofe Pou-
dar a Pound of fte, be digifed in White Lichen
Wine a gallon, for 6 or 7 days, and then difflufed
in Balneo. The Water hereof is of singular good
use for Palies, Trendlings, Convulfions, Weak-
efles, and all cold induration of the Members,
both inwardly and outwardly. It comfons the
Head, Brain, Nevers, Stomach, Heart, and oth-
er Vifera, Heaps Cataracts, eafe paines from a
cold caftle, and helps also in all febile pains of
the heart, and gives cafe in the Colick, 2 or 3
Spoonfulls thereof being taken upon the occafion.
Where Note: That the Welsh Harfard Spiknard
is never afed; as being a Plant which has little or
no Virtues offered to be in it.

CHAP. DCXLVIII.
of SPIKNARD Plowman.

I. The Name. It is called in Greek, Bassorhys,
Baccharis, or as some will have it, Baccharis;
vel Vinagris, Baccharis or Pancharis (from its
excellent smell); in Latin, Baccharis, and in En-
glish, Plowman Spiknard, and Bacchar.

II. The Kinds. Plowman says, that in his time it
was called Narduz Rufius, but as he says, and so
we also fay, it was an error in them which did to
call it: but its general Name is Baccharis, and
Baccharis Montefium (altho' it also grows in
England) Conyza major altera Dodonaei, Conyza
major Matthioli Lagianoe, Conyza major vulgaris
Stallions, (in his Parton) in English, Bacchar and
Plowman Spiknard. Parkinfon tells us of two
forms of this Plant, &c. This treated of in this
Chapter, and a Syrian kind, but the latter being
unknown in our Climates, we shall fiy no more of
it in this Work. The Colfum has prevailed upon
us, to call it Spiknard, yet it is no fiick thing,
nor in the leaf SNPKNARD
thin, nor has any relation to that
Plant.

The Descriptions.

III. Its Root confifts of many Strings and Fibers,
boiling somewhat thick, not running deep into
the Ground, but to taking hold of the upper face of
the Earth, that it may easily be pull'd up with one
hands, the small whereof is somewhat like to Avena,
but the Scent is less strong when growing in Gar-
dons, than growing Wild; like as Avena when made
a Garden Plant, and several other foetid Herbs,
which are of thin and subttil parts. It springs up
with divers somewhat long and large Leaves, full of
Vents, lying upon the Ground, which makes it form
as if it were Crampl'd, soft and gentle in handling,
and of an evergreen green color, seeming to be
White. From among which, (in the Summer time) ris
up a strong Riff Scale, three or four feet high, for
with divers such like Leaves, but smaller up to the Top,
where it is divided into many Branches, at the ends
whereof comes forth several flowers, three or four,
for the moft part, at the end of every fores of a branch,
and every one on a small Poftrufe. Which flowers
consists wholly of small Threads or Thrums, banding
white and round, and never had open like other flow-
ners, which confift of Leaves: They are of a dead
or paleish yellow color, appearing out of greenith
Seeds, which Thrums turn into a whitefih Down. At
the bottom whereof is the Seed, small and fluffy, which
together with the Down, is carried away with the
Wind, and ris up to several places of the Garden
where it is once Planted, and bears Seed.

IV. Gerard describ'd it after this manner. Its
Root is thick, grous and fliar, spreading about in
the Earth, full of Strings, the fragrant smell that this
Plant yields may well be compared to the favor
of Cinnamon, or Helenium, being a Plant known un-
to very many or molt sorts of People, in molt parts
of England. It has many blazheth rose Leaves some-
thing bigger than Primrose Leaves, among which
ris up a Stalk two Cubits high, bearing at the Top,
little Chaffy or Scaly flowers in small Branches, of
a dark yellowish or purple color, which turn into Down,
and

1668
Salmon's Herbal.  Lib. I.
and are carried away with the Wind, like unto the kinds of Thistles. Johnston in Gerard says, that this Plant here described is the Conyza major Marshalli, Tragil., and others.

V. The Places. It grows plentifully about Montpellier in France, and in many other Countries. It delights in rough and Craggy places, and in a lean and dry Soil, where there is no moisture. And Gerard says, that it grows in divers parts of the Weald of England.

VI. The Times. It flowers with us, about the end of July, or beginning of August. Gerard says, it springs up in April, flowers in June, and perishes its Seed in August.

VII. The Qualities. It is Temperate in respect to heat or cold, and dry in the first degree; Affrighting or Binding, Pectoral, Naphritic, and Alexipharmic.

XII. The Specification. It is a remedy for Athaha's, Coughs, Colds, Inflammations of the Eyes, swelling of Womans Breasts, drops Fluxes of the Bowels, and as Fliny says, helps to break the Stones.

The Virtues.

X. The Green Root. Authors say, that being bound, or hanged to, (I suppose they mean the Thighs) it brings away the Birth, and facilitates the Delivery. This Root for its sweet smell is oftentimes put among Cloths, to give them a kind of perfumed scent.

XI. The Decotion of the Root in White Wine. It opposes obstructions of the Vessels (as Paulus Virginianum says) provokes Urine and the Cours, is good against Convulsions, and for such as are inwardly bruised by falling from an high place. It is good also against Athaha's, Coughs, Colds, thornes of Breast, and other diftempers of the Breff and Lungs. Bathed upon Womans Breasts which are weald, and pained, it gives ease and difficulties the more.

It is good against pains of the Pitiues and files, opens Obstructions of the Spleen, and breaks the Stone (as Fliny says) expelling gravel, Sand and Tartarous Maculage out of the Uterus, and so gives ease in a Dyfuria and Stranguria. Drop into the Eyes it cools the Inflammation and stops the flux of Rheum into them. It may be given to half a Past Morning and Night, very well watered with Honey. It is also Alexipharmic, refils Poxion, and is good against the bitings of Serpents and Mad Dogs, and other Venomous Creatures.

XII. The Pouder of the Root. It has the Virtues of the former Decotion, and may be given to a Drown morning and night, against Violent Cataracts, and to break and expel the Stone whether in the Kains or Bladder.

XIII. The Cataplasm of the Green Leaves. Applied to the place of the Head pained, it eases the Head-ach. It also stops a flux of humors flowing to any Part, and strengthens weak Joints.

XIV. The Bath made of the Roots and Leaves in Water. Drink to half a Pint, it drops Catarrh; applied as a fomentation it stops a flux of Rheum to the Part, Cools Inflammations, and Cures Anabolics, Fire, being bathed therewith, and Cloths wet there in being also applied to the face. Made in great

C H A P. DCXLIX.

OF SPIDER-WORT.

I. The Names. It is called Greek, Phalangium, Phalangium. in Latine, Phalangium & Phalangites : and in English, Spiderwort.

II. The Kinds. There are several sorts of this plant, as, 1. Phalangium Abyssinicum, Phalangium antiquum. The Savoy Spiderwort. 2. Phalangium major Italicum album. The Greater Italian Spiderwort. 3. Phalangium non ramo Sum Vulgare. Unbranched Spiderwort: Cordus calls it Libago. 4. Phalangium ramo Sum. Branched Spiderwort. 5. Phalangium Virginianum, Phalangium Ephemericum Virginianum Johanns Tradescanti. The Virginian Spiderwort, The soon fading Spiderwort, and Tradescant Spiderwort, because Tradescant first brought it into our English Gardens. It has been thought by some to be the Silk-Grass which grows there.

The Descriptions.

III. The first or Savoy Spiderwort. Its root fights of many white, round, thick, brittle strings, joining together at the head, but are nothing so fine.

Spiderwort Savoy.
Salmon’s Herbal. Lib. I.

as those of the other Spiderworts. It springs up with four or five green Leaves, long and narrow, yet broader at the bottom, narrower towards, and pointed at the end, like those of the Lily Alphone, but being a little hollow in the middle. From among which arise up a round little stem, a foot and a half high, bearing at the top one above another three or four small, or as many flowers, every one of large as the day Lily, but much greater than in any of the other Spiderworts, of a pure white color, with some Threads in the middle, tips with yellow, and a small forked Pistil. After the flowers are poll, the head or Seed Vessels grow almost triangular, yet something round, in which is contained blackish Seed.

IV. The second, or Green Indian Spiderwort. Its Roots are purplish and white like the next following, but something larger. It has discs long and narrow Leaves spread upon the Ground, and not rising up as the former, nor yet so broad, but something broader than the root following. The Stalk is bigger, but seldom rises up so high as the next third Species, being long and unbranched, for full of white flowers towards the Top of the Spiderwort plant, but somewhat larger in other varieties, differing chiefly in the color of the Heads, for besides this blaw Purple here described, we have another which bears bigger and fairer flower Plants two, with a green and white, which have Red flowers; and some with White flowers. In some Years the Flowers of the Greater Red will come forth double.

V. The third, or Unbranched Spiderwort. Its Root consists of long white Strings running under Ground, like those of the foil described, but smaller. It has small Gras, like Leaves, but larger than those of Grass, or a whitish or grassy Green color, rising immediately from the head of or Roots. From among which rise up one or two Stalks, two or three feet high sometimes, height towards the Top, with a great many small white Starlike Flowers, which after they are poll, turn into small round heads, containing black Seed, like to the Seed of the little yellow Alphone, but lighter.

VI. The fourth, or Branch Spiderwort. Its Root consists of many Strings, tough and white, like the third; but its Leaves are something broader, and of a yellowish green color, much like in form to Grass or Quick Grass, yet something thicker and fatter, and of a more whitish green color. The Stalk, which comes up from among the Leaves grows to take a foot and a half high, and spread out with small branches towards the Top, refuliptished with many small white Starlike Flowers, consisting of few Leaves opefe like the flower, with Threads in the middle, of a whitish color mixed with a few yellow, which being fallen, small roundish Triangular Knots follow, containing black colored Seed.

VII. The fifth, or Virginian Spiderwort, supported by theo to be the Virginian Silk-Grass. Its Root is strong, and creeps far under ground, rising up again in many places with round Heads of long folded Grass-like Leaves, of a grasy accommodation green color, broader three for the Moff parts together, and not above, composing one a multitude, the bottom, and aboding green in many parts; the Grassy Winter, and in some places ruffling and rising once in the Spring, which Leaves rise up with the great round Stalk, being set therein as the Stems, commonly but one at a joint, being at the bottom, where they compass the Stalk, and growing gradually smaller towards the end of their Inscriptions in a sharp point. As the upper joint which is the Top of the Stalk, there grow two or three feet like Leaves, but smaller, from among which break out 10, 12, or 20 or more round green heads, hanging themselves down by little Rootstocks, which when the flowers begin to blow open, grow longer, and stand upright, bearing three small pale green Leaves for a bush, and three other Leaves within them for a flower, which by themselves flat open, of a deep blue purple, 12, or as many as they can, pointed or head in the middle, closely set about them with red hairy, hairy, or feathered Threads, tips with yellow petals. This flower opens itself in the dry rains; and thus they grow daily as they grow, and newer opens again, but perishes, and thus hangs down its head again. The green back of these Leaves, closing itself again, in the form of a head, as it grows after, but greater, the flower in the middle, growing to be the seed Vessel, in which is contained small blackish long Seed. Of these flowers seldom more than one or two are seen blown at a time upon the Stalk, for which reason it is a long time flowering, before all the beads are fully blown open.

VIII. The Places. Their Names for the most part from their Native Soil, or Place of growth, but with them some in Fables. The Virginia is a great enc eraff, and therfore is now grown Common almost in every Garden. It was first brought to us by Virginia since we have received from them several other Varieties, differing chiefly in the color of the Heads, for besides this blaw Purple here described, we have another which has bigger and fairer flower Plants two, with a green and white, which have Red flowers; and some with White flowers. In some Years the Flowers of the Greater Red will come forth double.

IX. The Common or Unbranched Spiderworts flowers before all the rest and the Branches a Month after it: the other two about one time, viz. towards the end of May, and not much after the Unbranched kind. Gerard says, that first and Fourth Flower in June, and the third about the beginning of June, and the second about August. The fifth or Virginia, from the end of May until July, if it has had green Leaves all the time, but later, if the Coldness of the Winter puts a Stop to its Vivacity. These Plants are all hardy, and will live and thrive almost in any Soil, but best in that which is moist. The time to take them and in Flanders this is in August; the several Heads of Roots may be placed where they may grow 2 or 3 Years unremitted. As they are Seed bearers, to from the Seed, Plants of the left kind, the most they which spring from the Seed are long before they bear Flowers, yet it is worth the labour and attendance.

X. The Virtues. They are hot and dry in the first degree, of thin parts, and Aulpharmpics.

XI. The Specification. They relit poison, and are particularly good against the wounding of the Pha- lanquium or Poisonous Spider, as Authors say, from thence it is thought they derived their Name. That of Virginia, is of no known Virtues or Use.

XII. The Preparations. You may have from the Common Spiderwort. 1. A Decidion in Wine or Water of the Roots, Leaves, Flowers, and Seed. 2. A Powder of the Seed. 3. A Vine Drink.

The Virtues.

XIII. The Decidion in Wine or Water. Dis- currier says, that being made in Wine, and Drunk, it prevails against the bitings of Scorpions,
Chap. 650. English Herbs.

Ons, and the biting of the Spider Phthalgium, and of other venomous beasts.

IV. The Reader. It has all the fame Vir- tue, being taken in Wine morning and evening to the quantity of a Dram, or unswelled with an equal quantity of Mithridate and to swallow, drinking a Glass of Wine after it.

IV. The Diet. Drink. The Roots being run d up with new Ale, and then drank for a Month together, it expels Poifon, yet tho' it be universally spread throughout the whole Body.

CHAP. DCL.

Of SPIGUEL.

I. The Name. It is called in Arabic, Mei: in Greek Naijipou: in Latin, Meum, and by some Ancient Authors, Athanantum, either from Athanantes who first found it out, or from the Mountain Athanantes in Thessalia, where the herb grew: Pliny calls it Macedonium and Hesperianum, from the places where the herb was found in his time, for says he in Italy it is only known by some few, tho' now it is known to grow wild in several places of that Country. In English it is called Spiguel and Specigen.

II. The Kinds. Formerly there was but one sort of this Plant known, now there are many Species thereof, the chief of which are the following, viz. 1. Meum Vulgatum, Meum Antiquum, Ter- dylium Cordi, Anethum Synephe, Anethum torac- tum alienun, Meum folius Anethi, Our Common or ordinary Spiguel. 2. Meum Spicarium Italicum Matricula, Meum adulterinum Eubalci & Tuber- namentum, Meum Spicarium alienum Hesperi- lum Lobeli, Beldur Spiguel. 3. Meum Germanicum, illis Arboretina Alba, Meum Alpinum, German Spig- nel or Mountain Spiguel.

The Descriptions.

III. The first, or Our Common or Ordinary Spiguel. Its Roots do spread much and deep in the Ground, many Branches or branches springing from one head, which is hairy at the Top, of a bluish brown color on the outside and white within, having of a strong good scent and of an Aromaticke taste. From whence, rise up several long Stalks of very fine car Leaves, smaller than Doll, yet thick on both sides of the Stalk, and of a good smells. From among these Leaves rise up round stiff Stalks a foot and half and sometime two feet high, with few joints, but better with Leaves resembling Fennel or Doll, but flaver cut, and at their Top or Um- ber, of fine pure white flowers at the edges, on which will sometimes be seen a show of a reddish or yellow color, especially before they are full blown, and are succeeded by small, long and somewhat round Seed, larger than the ordinary Fennel Seed, and of a browner color, divided into two parts, and crooked on the back, at most of the Unhke- li- comme Seeds.

Spiguel true or Common.

Spiguel Bafard or Italian.

Fennel.
Salmon's Herbal. Lib. I.

VII. The Virtues.

XI. The Decoction or Infusion of the Roots or Seed in Wine or Water. 1. Taken morning, noon, and night, to the Quantity of half a Pint, it gives cause in the Stomach, helps all sorts of Stoppages of the Urine, and provokes the Terms in Women when flopped; it eases also pains in the Knees, Womb, and Bladder, opens Obstructions of the Stomach, Liver, and Spleen, gives ease in the Colic, and other like pains of the Stomach and Bowels, re-
prefers Vapors, and gives relief. 2. In Fits of the Mutter, as also in Cataracts, Rheumatisms, and the like. It is an Astringent against Poison, as also against the bitings or Stinging of Vipers, Mad Dogs, Scorpions, Hornets, and other Venomous Creatures.

XII. The Powder of the Root or Seed. It may be given to a Dram morning and evening, against all the aforenamed Distempers, in any proper Vehicle. Or it may be made into a Looch with Honey, and so taken; and then it is proper to open Obstructions of the Stomach and Lungs, cut tough from and expel obstructions, and to dry up Cataracts afflicting those parts.

C H A P. DCL.

OF SPINAGRE.

I. THe Names. It is called by the latter Graecum Spinacia: in Latin, Spinacea (a rustic in use medici) but by most Spinacea, Olius Hispanicum Tragi, (supposing it a Poisorrow which first came from Spain) and in English, Spinage or Spinach.

II. The Kinds. Some Authors will have it to be a Species of the Arachis, others of the Beets; others again of the Bitter; but I think it has no Relation to any of these Plants, but is a particular kind of its own. Some make four Species of this Herb, accounting that which bears no Seed to be One, which is indeed but accidental, as it happens several times to divers other Plants, as Hemp, Herb Mercury, &c. There are indeed three sorts hereof, viz. 1. Spinacea femina acutula minor, The Jeller Spinage with prickly Seed, which is our Common Spinage. 2. Spinacea femina acutula major, The greater prickly Sected Spinage, which is also Common to be had. 3. Spinacea femina non acutula, Spinacea femina Levata, Smooth Sected Spinage, which is a more rare kind, and Nurt up but in a few Gardens.

The Descriptions.

III. The first or Jeller Spinage with prickly Seed which is (as before is said) Our Common Spinage, Its Root is long, white and small with many Fibres adjoining to it. It has long green Leaves, broad at the Stalk, and rent or torn as it were into four Corners, and sharp pointed at the ends. It quickly runs up to Stalk, if it is home in the Spring time; but else, if Soon at the end of the Summer, it will abide all the winter green, and then suddenly in the very beginning of the Spring run up to Stalk, bearing many Leaves both below, and at the Top, where there doth appear many small greenish flowers, in Clusters, and after them a small prickly Seed. If it be after cut, it will grow the thicker, or else Spinage up very small, and with but few Leaves above the Stalk.

IV. Gerard describes it thus. Its Root consists of many Threads, from which Spinage forth and tender
X. The Spinage. It is cold and mottl almost in the second degree, and by reason it is of a Watery substance, almost without Tasters, and therefore quickly descends out of the Stomach into the Belly, being withal Alcardive and Viscous, keeping the Bowels Easy.

XI. The Specification. There are no nominal Virtues ascribed to it by Authors; but as it is cooling 
fo its gastrizes a hot Stomach, Quenches Thirst, and is good against Fevers.

XII. The Preparations. It is an Herb fit for Saltees, and other uses of the Table. Many People Sow the Herb in a Pot or Pipkin, or in a Squares-Pan, or between two Plates, without any other moisture than its own, and after it is a little pressed from it, it is deaff as a hoiled Salt, with Butter, Vinegar, Pepper, and Salt, and to make a very palatable Dish. Some Cooks make it into Tarts, by mixing it with Linum very thin filled, with the addition of a little Sugar, and some Spice, which are Palatable enough. But besides these Kitchen Preparations you may make therefrom, 1. A Liquid Juice of the Herb. 2. An Antifbcbiric. 3. A Confev. 4. A Distilled Water.

The Virtues.

XIII. The Liquid Juice. Mixed with half its weight of Honey and fo taken to 4 or 6 Ounces in the morning cooling it looses the Belly, and cleanses the Stomach and Guts, of Cold, flimsy and Pituitous humors, and evacuates Temorous matter from the Reins, Interets, and Bladders.

XIV. The Antifbcbiric. It is made thus. Take of the Liquid Juice clarifled a Pint: Juice of Linum half a Pint: double refined Sugar enough to make it pleasant. Dole a quarter of a Pint or more now, and then especially in the coming of the burning fit, as also in the height thereof, and to quench thift when necessities requires.

XV. The Confev. It is good against Coughs, roughs, and the foul of the Breaf and Lungs, cools and quenches thift in hot burning Fevers, and very much refreshes the failing Spirits, cured from the wating heat of the Stomach and humors.

XVI. The Distilled Water. It may be taken to a quart of a Pint, acuted with a few drops of Spirit or Oil of Sulphur and made pleasant with double refined Sugar: it cools admirably, and is good against all forts of Malady and Frightful dilafies, quenches thift and cleanses the Lungs, Stomach and Bowels of acid, sharp and Pitudous humors.

C H A P. DCLI.

Of S P L E E N - W O R T, Smooth and Rough.

The Names. It is called of the latter Arabic, Scalopatrium; in Greek, Scapania, 3'pam') in Latin, Aspervium and Scaphium; in English, Spleenwort, Milk-nusfe, and Scale-fem.
II. The Kinds. There are two special kinds thereof, viz. 1. Asplenium afperum, Asplenium, As-
pleniumStdStringium, Scopendrium, and Scopendrum (from the likeness of the Leaf to the
Scopendrum worm, so called) also Rhizoma, is (as it is in the Vulgar Copies) Theophrasti, Scol-
pendrium, Arabice, and Theophrastus, Hemionium, which
Galen calls Malice Herba: in Latin, it is called
Aspennum, Scopendrium, Scopendria and Ceter-
ach; and in English, Spleenwort, Smooth Spleen-
wort and Milk root. In former times Apotheca-
ries and Physicians held Harts Tongue to be the
Scopendrium corum of the Ancients, and that
Aspennum was not Ceterach; but these errors are
now sufficiently made manifest. 2. Asplenium afperum,
Asplenium afperum, Rough Spleenwort, and this is
threefold, viz. 1. Asplennum afperum, Lactifrons, Lactifrons
altera State or major Matthiolus, Matthias's
greater rough Spleenwort. 2. Lonchitis aeria minor Matthiolus, Asplenium Sylvestre Trog.
Struthigerus, Cordis & Thafis; (that is to say, O-
frich Fern, from the resemblance of the Leaves
to Ostrich Feathers.) Lactifrons altera Neoterico-
rum, & Asplenium Magnum by name. The smaller
or smaller Rough Spleenwort. 3. Lonchitis Ma-
naranta, Lactifrons aeria Maranta, Jaufis, allo-
rumque, Hsecolentheanis Maranta by Matthiolus,
Bullard Rough Spleenwort.

The Descriptions.

III. The first special kind or Smooth Spleenwort,
which is the true Scopendrium, true Spleenwort,
and Ceterach. Its Root is thick, thrifty, and
bulky, which feeds forth many long single Leaves,
cut in on both sides into round dents, even almost
to the middle Rib, which is not so hard as that of

Spleenwort true or Ceterach.

of Harts-Tongue. It has several Stalks of leaves,
most are like unto the Smooth Spleenwort or Ceterach,
but more like unto those of Vollypody, about a span
long, cut to the middle Rib on both sides, making
as it were so many several little Leaves upon one
leaf, and each small Leaf denoted
about the edges with sharp points, and rough on
both sides, but without such spots on the backs
of them as Vollypody and Ceterach have.

VI. The second rough kind, or lesser or smaller.
Rough Spleenwort. Its Root has a thick head
which is covered with Scales lying one upon another,
with dewers before adjoining to them. It is some-
things like to the former or first rough kind, but
that the divided Leaves set on each side of the stiff
Chap. 652. English Herbs. 1075

browny Stalks are narrower and longer, each separated from the other, but not fully to the middle Rib. In the middle of these outward Leaves, rise up others which are longer, and having blunter Stalks of Narrow Leaves like unto them, but fully separated, and stemming as if they were Curled, with brown rough Spots or Scales on the backs of them, as in other Ferns. There is another of this kind, which is finer than this, and is found about Colchester in Essex, and in other places, growing in the out borders of Fields, and by Hedge sides.

VII. Gerard says, that the Root of this second rough kind is black and fet with a number of slender firings, and that it is partly like the other Ferns in form, bearing neither Stalk nor Seed, having narrow Leaves a foot long, or something longer, flatted on the edges even to the middle Rib, smooth on the upperface, and of a fourth green color underneath, and rough as are the Leaves of Poly-pody.

VIII. The third rough kind, or Baffard Spleenwort. Its Root is fmall, composed of many firings. It has brown rough Stalks, with pointed Leaves on them, something like to the Female Fern, but thicker and greater by much; green on the upperface, and spotted with brown rough Scales on the other side, much like to Ceterach or the smooth kind. Gerard says, its Root is thick, black, and bulby like as it were a Cossas Neft. And it is not only barren of Stalks and Seeds, but also of those marks and spots with which the others are spotted. The leaves are few in number, growing Pyramidal or Steeple fashioned, greater and broader below, and gradually shorter towards the Tip.

IX. The Places. The Smooth Spleenwort, or Ceterach grows well upon Old Stone Walls and Rocks, as in moift and shadowy places in many parts of England, as about Derby and other the West parts plentifully, as also on Framborough-Cote, on Beechesfield Church in Earthberie, and on the Mount in Kent, and in many other Places. It is also found about Bath, Wells, and Salisbury, where it grows in great plenty. The Root of the Rough Fern grows in moift places, and Moorish grounds; it is found growing in Holy, and I have found it growing plentifully in several low and moift places in the South Carolina. The second and third grows in moift places and Gravens, as also on barren Heaths in several places both of England and Germany. The second grows not only on dry barren Heaths, but on Sandy Banks and shadowy places in moift parts of England, but especially on Hampstead-Heath near London, where it grows in great abundance.

X. The Times. The Ceterach or Smooth Spleenwort, like Poly-pody, abides green all Winter, and the Rough kinds flourish and appear in their Vigor, at the same times and seasons in which the other Ferns do.

XI. The Qualities. They are all temperate in respect to heat or cold, mollifie or dryness, or if they exceed it any ways, they are rather hot and dry in the beginning of the first degree, they are A- peritive, Abruftive, and wafting or consuming, Diuretic, Hepatique, and Splenetic.

XII. The Specification. Spleenworts of all the kinds, but the Ceterach or Smooth kind, more especially, (and which is mollie and chiefly used) curris all sorts of pains, Tumors, or Swellings, and Oldfrictions of the Yellow Jaundice, Hiccough, and the Strangury or Pitting by drops, and is said also to mutate the Stone in the Bladder, to cure Melancholy, and speedily to help a Virulent Consumpt, and other Symptomes arising from the French Dryfie.

XIII. The Preparations. From the Ceterach or Scopelopendrium, you may have, 1. A Decoction of the whole Plant in Wine or Water. 2. A Powder of the same. 3. A Infusion from the Backside of the Leaves. 4. A Ely from the Aftes. 5. A Distilled Water. And from the Lachitis or rough kind, you may have, 6. A Powder of the Dryed Leaves. 7. A Cataplasm of the Green Leaves.

The Virtues.

XIV. The Decoction of Ceterach, (the whole Plant) in Wine or Water. Distillers say, that the Decoction of the Leaves in Wine, being drunk for the space of Forty days, Cures Melancholy, takes away Infimations of the Spiles, helps the Strangury and Yellow Jaundice, and caustes the Stone in the Bladder to moulder and pass away, this Plant being of thin and fibrid parts. He says likewise, that it stops the Hiccough, and Vomits, dissolves, but induces Burremets in Women, and therefore by them to be avoided.

XV. The Powder of the same. It may be taken to a Dram morning and night in any convenient Vehicle for all the purposes aforesaid. It is also by some affirmed, that is not only good against swelling and hardness of the Splenic, but that all Diffemders of the Liver may in a very short time be cured therewith.

XVI. The Dust from the backside of the Leaves. Martybrians say, that if a Dram thereof be mixed with Amber in the Powder half a Dram, and taken in the Juice of Pufflane or Plantane, 6 x 2 (4 Ounces)
of SPONGE

I. 

TYP. Name. It is called in Greek Σπόνγα; in Latin, Spongia; and in English, Sponge, from the Greek Name.

II. The Kind. It was the opinion of some that Sponges were Zoophyta, i.e. Plantamnentes vol Plantamnemata, viz. Animal or Sensible Plants: and tho' this was the thoughts of some in Aris- tocles time, yet he forms not to be of that Opinion, for in his Historia Animalium, Lib. 7, Cap. 16. He says, that tho' divers did think and say in his time that Sponges had Sense in them, for that as they say, they would shrink if any did pluck them, and were hard to be pulled up, and that they do: because, when the Surgeons of the Sea would break them off from their Seas or Reference yet (say he) divers did doubt of the truths of that Relation. This doubeth a foolish and false Opinion, for a Sponge is no more a Sensible substance than a Mushroom, and is nothing else, but a Plant like Excellence, bred from the matter it grows upon, as Agarick is from the Larch-Tree, and Fern-Leaf from the Felter. We have no more to Treat of here, but of the Common or Ordinary Sponges which are daily in use, of which some are better, some are better. Some round, some cornered, some flat, some thick, some close and hard, others more loose and open, some of a fine and thin substance, others of a currier and thicker: some of a brown yellow color, others of a pale yellow, others brown white. And Sponges thus, that form were called, 1. Hirina, Goat Sponges, from a hairy best they had upon them. 2. Velaria, from the smallest of their holes, being almost as close and narrow as those in Vals. 3. Remojs Espilado, from their being branched with a great Pipe-like hollowness.

The Descriptions.

III. Sponge is of a light, hollow, fift substance, neither Stony, Woody, nor Herb-like, but rather like a bottom matted substance made of fine Wool or Cotton wrought together by nature, full (in all parts of it) of small holes, some greater, some after, which are ready to receive and hold much Water, and by pressing or wringing it hard, to yield it out again; but as it encloses in the Water, viz. in its place of Growth, it sometimes gathers into it, or else there is driven into its holes, several small gritty Stones, which are commonly found therein, which show the breeding and growth thereof, is upon some Rocky, or Gravelly Places, or not far from the Earth.

IV. The Places. It is usually found in the Sea, and upon some shores, after it has been by some accident broken off from the place on which it had Grown, which possibly might have been on the side of some Stone, or Rock, or Gravelly or Rocky Creek, or hole near the bottom of the Sea or Sea floor, which lies always covered with Water.

V. The Times. The Seasons of its Flourishing and Age is unknown, its possible it may equally grow through all the parts and days of the Year, the external Air not penetrating, or much operating upon the bottom of the Sea, or those parts which are always pretty deeply covered with Water, so as to cause any difference in the times of the flourishing of such things as grow, and are always overwhelmed with the Waters of the Deep.

VI. The Qualities. It is temperate in respect to heat or coldness, dryness or moisture, Aperitive, Albtirractive, Diuretic, and Nephritic.

VII. The Specification. It is said to be a peculiar Remedy for the Kings Evil, Sand, Gravel, or any Tarrauros matter in the Bile or Bladder: Profitable against Blains, Borches, Boils, Pufhes, and other breakings out in the Face and Skin, and to clear the Eye-light.

The Virtues.

IX. The Decoction is Wine or Water. It is used for a Foaming or Bathing; it easeth pain, helps to recent Tumors, and softens such as are hard; after Bathing the Sponge it itself may be applied as hot as it may be well endured and be bound on.

X. The Simple Powder of Sponge. It is made by drying the Sponge thoroughly by the Fire, or in an Oven, almost to scorching it, and then beating it to powder in an Iron Mortar. Dose a Dram in any fit Vehicle, taken in Wine, it is said to Purge like Cremon Tartari, cutting thick, gros and Vicious humors, it easeth pains of the Stomach, Griefing of the Guts, Colick, Stomachy, Stone, Gravel, &c.

XI. Hermes Powder of Sponge. Take Sea Sponge
Chap. 653. English Herbs.

Sponge burnt up to a Coal 3 Ounces: Cattle Fish Bone Calcined, Egg-Shell Calcined, Salt Grain, Galls, Ginger, Long Pepper, Pellitory of Spain, an, an Olive, an Olive-Shell, and Olive-Shell, mix them together with the Water Distilled from the aforesaid Sponge, which decrude or dry by degrees. It cures the Kings-Evil, being taken for a Month together, half a Dram at a time mix, with half an Ounce of White Sugar, beginning to take it when the Moon begins to decrease, or preferably after the Full. It also is Eaid to cure Pulses, Bocche, Bolls, and Swelling Pimpls in the Face and other Parts.

XII. The Afters. They are made by a simple and naked Calcination in an open Fire, or of the Caput Mortuum, at the bottom of the Retort after the Spirit, and Volatile Salt are ascended or drawn off. Mixed with a little Wine, it is used to clear the Eyes, and to cure them when Blood-flit, or troubled with a Rheum or Watnent.

XIII. The Powder of the small Stones in the Sponge. It is given to drink as are troubled with Stone, Gravel, Sand, and Tartare Mixture in the Kidney, to break the Stone, and to caus to pass away with the Urine. Dose: a Dram morning and night in a Glass of White Wine, &c.

XIV. The Volatile Spirit, Salt, and Oil of Sponge. They are made by distillation in a Glass Retort. Take as much Sponge as you please, cut it very small, put it into the Retort, which place in a close Receiver, with its receiver: Later the pani- dure well, and give Fire Gradatime, like as in di- stillation of Tartar, and continue to increase it by little and little, till the white and Oily Clouds begin to come, and that you see the Volatile Salt does sublime, and flock to the sides of the Receiver; continue the fire in the same degree, till all is come forth, and the Receiver grow clear of itself. Then grate the fire, and all being cold, take away the Vessel, pour out the Spirit and Volatile Salt together, and separate the Oil by a Tunken, or some Cotton, which keep in a Glass by its self. Put the Spirit and Volatile Salt into a two Glasses Body, and revilify them in Sand, keeping them together. This Spirit is a singular Livewortchip, or breaker of the Stones. The Salt also is good to break the Stone in the Reins and Bladder. It is powerful also to diffuse and cure all Stramous Swelling or Kings-Evil, in the Neck or any other part, being given three times a day, in 6, 8, or 10 in any proper Vehicle. This Volatile Salt and Spirit of Sponge are said to be some of the greaterspecificks in Nature for the Cure of the Kings-Evil, being given morning and night in the proper Vehicle, the Reins and Bladder being premised. And indeed the Spirit, Volatile Salt, and fixed Oil of Sponges, are not only excellent against the Evil, but also to diffuse and cure the Bronchoctis, which is a Bunch or great Swelling round the Throat, to open Ob- structions in the Reins, Ureters, and Bladder, to break the Stone, and to expel it, as also Sand, Gravel, and the like, from the Urinary parts. By following these Medicines for some time, you will daily and evidently see their Scripturabs, Scramas, and Bronchoctis Tumors, to decrease and vanish to nothing. In the Distillation, part of the Volatile Salt will arise and flock to the Top and Neck of the Retort, and part of it will mix, and be diffusd in the Spirit. You may diflay each en- part of you pleased, or diffuse all the Salt in the Spirit, and revilify them together from the Olea- ginous particles, as we have in many places taught in our Sepulchre, or Vagabite Shop. The Calcin'd Sponge at the bottom of the Retort may be reduced into Powder or Afters for the paroxysm as Sect. XII. aforago, and it may also serve to stop Violent Flow of Blood. From the Caput Mortuum, as it is left in the bottom you will get, but little first Salt, without a new and open Calci- nation, and therefore it is necessary to Calci- nate it again in a Crucible till it is white, after which you may draw forth the said first Salt after the Vul- gar Afters. This first Salt is of the nature of other first Afters, as Salt of Tartar, Salt of Oller-foths, and the like, and may be given in the same Cases as gr. 12, ad 24, in Arinage, Par- try, or Onion Waters, against Obstructions in the Reins, Ureters and Bladder, Stone and Gravel, and to absorb Acid humors, which are the causes of many pernicious Difeases. See more at large hinted in the Third Edition of Our Pharn. Bo- ronos. Lib. 1. Chap. 2. Sect. 37. and Chap. 10. Sect. 40. where you will find much satisfi- cition.

XV. The Compound Powder. Take Powder of Sponges, Powder of Spur or Hog-Lice, an, an Olive, Powders of Crab-Eyes and Winter Cherries, an, and half an Ounce, mix them. Dose: from 2 Scroosomes to 4, or a Dram and half in Wine, Ale, Arinage or Fatty Water, warmed with Syrup of Marsh Mallowes, against the Stone, Gravel, Strangury, Kings-Evil, Bronchoctis, &c. to be given morning, and night, &c.

XVI. Pistles or Teins made of Sponge. The Sponge being Dips into a thin Gene Water, in then to be sauce'd hard, and press strongly in a Press, and so kept till they are perfectly dry, and then to be cut out into Teens, or Pistles, of what form or bigness you please. They are put into hollow Ulers which are ready to close, before they are thoroughly cleansed, and to open and widen the Orifices of Fillets, hollow Ulers, &c. A Thred being first tyed to them before they are put in, thereby to pull them out again.
Salmon's Herbal. Lib. I.

The Kinds of the Garden Species. The most common are these three, viz. 1. Laurel, Lathyrus major hortensis, Carpatia minor, The Greater Garden Spurge. 2. Lathyrus minor hortensis, Calypatia minor, The Lesser Garden Spurge. 3. Lathyrus minor fure conglomerato Bauhinii, The smallest Garden Spurge, and this very probably is the Calypatia fissa Calypso. The Name Spurge, is supposed to be derived from its Purging Quality, it being an exceeding great and very Vehement Purger.

The Descriptions.

IV. The first, or Our greater Garden Spurge. Its Root is long and Woody, perishing as soon as its Seed time is over, and springs again every year of the Seed of its own Spring. It rises up with one bulbous thick about Stalk, of a fingers thickknof, fhandomed over as it were with a brown color, on which grows up to the Top for the first year, many thick fat long and somewhat narrow Leaves, of a bluish green color on the upper side, and more whitish underneath, something like unto Willow Leaves for the form, which being cut or broken yield Milk as plentifully as any of the other Spurges. The next year after, it spreads it self into many small Branches, with smaller Leaves at every partition, every part whereof yield Milk as the others do. The flowers are of a Pale yellow color, and stand in Cyls, as the other kinds do, but are smaller than some of them yielding forest, and nothing near so hot and burning Seed, which is enclosed in Triangular Beads or husks, something like to those of Valma Chiffli, but rounder and larger, than on many other of the Spurges, which in the hot Sun (the beads or husks cracking or dividing) will fall out of their own accord.

V. The second, or Lesser Garden Spurge. This in its Roots, Stalks, Leaves, Branches, Flowers, Seed and form and manner of growing is wholly like the former, facing that in every part thereof it is lesser, and can only be distinguished from it by that very sign, and by which it is distinguished from the other.

VI. The third, or Smallest Garden Spurge. Its Root is small, having many Strings with Fibers adjoining to them. It springs up with many slender branches lying on the Ground, set full of small Leaves, no bigger than those of Knotts, from among which rises up a Stalk, about a foot high, having many other Branches springing from it, almost from the bottom to the top, which are set full of such like small Leaves, as grew below.

Spurge Garden Smallest.

At the Top whereof come forth many flowers, which are small and yellow, clustering thick together, upon small Stalks, but not spread abroad like the former. The Leaves and Stalks of this yield a Milky Juice like those foregoing.

VII. The Places. These all grow in some places Wild about the borders of Field, but for the most part in Gardens almost every where, in which when they are once Planted, they do not easily quit their habitation.

VIII. The
Chap. 655.  English Herbs.  1079

VIII. The Times. They all flower about the latter end of June, and throughout July, and their Seed is ripe in August.

IX. The Qualities. They are hot and dry in the fourth degree, Carasertas, and very strong Emericks and Catharticks. Of which the Seed is for the most part to use with us, to purge with, both by vomit and stool.

X. The Specification. Spurge is proper against the Scurvy, Dropisy, Jaundice, Gout, and Rheumatism arising from a Cold cause.

XI. The Preparations. You may have them from 1. A Liquid Juice or Mith. 2. Troches of the Juice. 3. A Decoction in Wine or Water or Broth. 4. The whole Seed. 5. A Distilled Water of the whole Plant.

The Virtues.

XII. The Liquid Juice or Mith. It works more Violently than the Seed, and therefore is scarcely fit to be taken internally, but to be outwardly applied, and that carefully too, and so it is a depleatory, and helps to take away hair on the Eye-brows, Forehead, Temples and other parts, but it ought not to touch any other part of the Face or Skin. Being also Cautionly applied, it takes away proud and dead flesh in Wounds, hard Callous Incrustations, Knots, Corns, or Warts in the head (if they be first pared to the quick, and then applied); it is also good against running Scabs and Sores, as also to obliterare Scars, Spots, and blemishes or other marks of the Skin. If it is put into an hollow Tooth, (which you must do with that Caution, so as it may touch no other Tooth, Gums, or Mouth) it will cause Pain thereto.

XIII. The Troches. If the Mith is made up into Troches or little Balls, with Meal or Flower of Beans, Pease, Barley, or Wheat, and kept dry, it will live all the Year to use, as occasion is offered for the purporses aforesaid.

XIV. The Decoction in Wine, Water, or Broth. It has all the Virtues of the Liquid Juice, but much more gentle, and is good to remove most external deformities of the Skin. Taken inwardly it works to some purporses (as in the Scurvy, Dropisy, Jaundice, Gout, Evil, and Rheumatism) more safely than the Seed, and more weakly.

XV. The Seed. It is given 1, 7, 9, or 10 grains or Seeds at a time, according to the Age and Strength of the Patient, which purges both ways, i.e., both by Stool and Vomit, and evacuates tough Phlegm, Choler, Melancholy, and Water as Disoriders say, andдобу счоте дифиаис caused by the abounding of those humors. The usual manner is to swallow the Seeds whole, without breaking either Husk or Kernel, and then they work the more gently and weakly: but if the husks are broken, and the Kernels swallowed with or Chewed, or otherwise bruited and mixed with Drink or Broth, they will then work the more violently, and therefore are to be taken with the more Caution.

XVI. The Distilled Water of the whole Plant. It is of an effectual use to cleanse the Skin from Freckles, Scarif, Morphew, or any other discoloring, denisement or deformity of the Skin, used either in a soft, or mixed with Bean flour or Battert Dittany, or Crowfoot water, being gently Bathed on the affected places, removing the Diff

of

CHAP DCLV.

OF SPURGE small, or, ESULA small.

I. The Name. It is called in Greek Εφύλα, in Latin, and in the Shops Esula, Esula minor, Πρεφση, (as if it were a Pine Spurge,) and in English, small Spurge and small Efula.

II. The Kinds. There are Twelve or Thirteen several sorts of this Plant, but the five following are chiefly known to us, viz. 1. Esula minor, Πρεφση minor, Τιθυμανος, small Esula or Pine Spurge. 2. Esula minor, Πρεφση minor, Tithymalus pinet, small Esula or Pine Spurge. 3. Esula Cypria, Cyparissia vulgaris, Tithymalus Cyparia vulgaris, Our Common Cypress Spurge, or Welcome to our House. 4. Esula five Tithymalus Helioscopius, Esula soliflora, Sun Spurge, because it follows the motion and course of the Sun. 5. Esula exigua Turgi, Peplis minor Deliacampi, Tithymalus Lepe- phytie Mattihi, Dwarf Spurge, or small Annual Spurge.

The Descriptions.

III. The fifth or Round headed Spurge. Its Root is small and long, with many small Strings and Fibres at it, perishing every year, and rising again

Spurge round headed small, or Peplus.
of its own Sowing. It flows forth round about the Root, many small whole reddish upright branches, with small Leaves set by Cymes for the most part, somewhat like to the Leaves of the Salmon Spurge of Sect. VI. following, but rounder pointed, and smaller, of a greenish color on the upper side, and a little reddish or purplish on the under, which will oftentimes change to be wholly purple, in the Summer-time. The flowers are very small and yellow,站着 more round or else together, as it were in a Globel, alternately like unto the root. The Seed is very small and contained also in a kind of Triangular heads, which are small and contain small round groisy Seed, not much bigger than Poppy Seed.

VIII. The Poesies. The soft grows in Vineyards in France, and many of the borders of fields: Gerard says, it grows in Salt Marshes near the Sea, and as in the isle of Thanet by the Sea side, between Raenlers and Margarets, in great plenty; it also grows very small, often where the borders of fields, both by Rivers sides and borders of Fields, but with us only in Gardens. The fourth, grows wild with us in many places, Gerard says, it grows in barren and waffle grounds, and in carable Land, planted every where. The fifth grows in many Chalky grounds in dry hilly places, as also in our Corn-fields.

IX. The Times. The third kind commonly flowers in May, all the others in June, July, and August, and their Seeds are ripe in the months following.

X. The Qualities. Eufa is hot and dry in the fourth degree; Inflaming, Catheretick, Strongly Emeryck and Cathartick, of these the third kind is chiefly used.

XI. The Specification. The Seed and Root are chiefly in us with us, and are good to evacuate Viscous humors of all kinds, and Cure the cold Scryw, Dropy, Jaundice, Evil, Rheumatism, Sciatica, and Gout. The Spurges juice has all the Properties but much more violent.

XII. The Preparations. There are of Eufa, 1. The whole Seed. 2. A Decoction of the same in Eau Breth. 3. Preparations. a. The Milk or Juice. 6. A Diluted mater of the whole Plant. 7. A Powder of the Seed and Leaves. 8. An Extract.

The Virtues.

XIII. The whole Seed. They may be given build'd from 2 to 8 (the Dioscorees says they may be taken to a Dram, which is too large, a Dose by much for our English Constitutions) against the Scary, Dropy, Sciatica, Gout, Rheumatism, pain in the Stomach, and Hyperchondria Lachancholy, they both Vomit and Purgate briskly and expel Water, Flegm, Melancholy, Choler, and other Viscous humors and Tenacious matter from all parts of the Body.

XIV. The Detolation of Seed or Leaves in Eau Breth. By Batheing with it, it cures the Stingings or Bittings of Scorpions, Horses, Serpents, and other Venemous Creatures, and purges strongly downwards Choller and Flegm, eases the pains and takes away the hardnes of the Belly, and melting of the Bracts. And is singular against the Dropy, Sciatica, Rheumatism and Gout, being taken every other morning inwardly.

XV. The Root prepared. It is done by bruising it, and steeping it in Vinegar, and so reducing it to powder. Dioscorees says, it may be given to 2 Drams: but I am satisfied that given from half a Dram to a Dram, according to Age and Strength may be a cudiçious quantity: it may be given in Milk or Homed Water, for all the purpuses aforesaid.

XVI. The Milk or Juice. It is dangerous to be taken inwardly: but outwardly, it is good against the Stinging of Scorpions and Horses, the Bittings of Serpents, Mad Dogs, &c. and applied to Warts.
Chap. 656. English Herbs.

Watches, Corns, and other Excrements, it takes them away. And mixed with a sufficient quantity of Honey, it is good to clear the sight, help dimness of the Eyes, watering and running of them, and to take away Films or Scars growing in them. The Juice is made by beating in 3 Morcus and expressing it; but Disorders hews us another way of doing it: Thus. Beat the Roots, and put them into a Vellum full of water, filling or beating them well therein, and with a feather gather the uppermost upon the Water, which being dried and kept, serves for the uses aforesaid, and for those which have the Dropy.

XVII. Pils of Eeula. Take the Root prepared by steeping a night and day in White Wine Vinegar, reduced to Powder, an Ounce: After two Ounces: Mustick 3 Drams; all being in Powder make them up into Pills with Fennel Water. Dose from a Scruple to 2 Scroptes. Turgus says, these Pills are good against the Dropy, and such as are short winded, and may be taken without pain or danger.

XVIII. The Distilled Water of the whole Plant. It makes a good Wash against Tanning, Sunburning, Yellowwurth, Freckles, Lentils, Scarfs, Morphed, and all other kinds of discolorations and deformities of the Skin, it being waft, therewith 3 or 4 times a day, the Pores of the Skin being first opened, by wafting with warm Water. It may be made much more potent, if a little of the Juice be added thereto.

XIX. The Powder of the Seed and Leaves. They are fit to be prepared by steeping them in strong White Wine Vinegar, then drying them, and afterwards reducing them to Powder by beating. Disorders hews, the Powder may be given to 3 Drams, but in our Climate, if it is given from half a Dram to a Dram it will be Dose large enough. It is given against the Dropy and Gout.

XX. The Extralum Eeula Rolandii. It has all the former Virtues; and may be given from a Scruple to Dram, with warm Broth, according to Age and Strength. With this Rolandus did wonders, and almost incredible Cures in the most rebellious, inmost, and deplorable Diseases.

Chap. DCLVI. Of SPURGE Great, or, PALMA CHRISTI.

I. THE Names. It is called by the Arabians, Cherus, and Korus; in Greek, Καταποτα, Cid and Creton, Καταποτα, and Rarini, Καταποτα, animals familiaris, quod referre fumus: Aria Montanas in his Commentary upon Jonas Cap. 3. says, that this Plant is signified by the Hebrew word Kipha, that is in our Bible it is translated a Guard. In Latin Ricinus, Palma Christi, Cataputa major, Gramene Region by Hefayes; and by some, Prindecaputa. In English, The Great Spurge, and Palma Christi.

II. The Kinds. There are several sorts of this Plant, but the chief are, 1. Ricinus, Cataputa major vulgaris, Palma Christi. The more Com-
Salmons, the this us or eight brown but Winters may pretty Cap. water peculiar 2. accident may allho Welt-Indies, cold the white and as dyed Kernel has like Lib. difcolored, an not Gerar the fome but Man, but his woody troubles 'heads, Sialk, "higher 1082 fays being 'is having long fiery of (in branched as leffer but thofe to angular whofe as black, it is convenient that it be hyprick or irrige hefprings himfelf that there is no almofter in the head, and eat or without bearing any Seed, but further or higher up, upon the stem, or main Salts, and fonetimes upon the Branche, branch forth other leaves, which are the Seed, upon long Stalks, being Triangular, rough and obflorbed on the out- face, or outward shell, which opening it felf, or being opened, there lies within the Seed, whose outward back is difcolor'd, or as it were footed and shaped like unto a Tock or like, which con- tains within it, a pretty large, round, fomewhat long and flat fining Seed, of a brown color, having a white Pulp or Kernel within it, of a very hot Taffe, burning the Mouth and Throat of faith as eat it, but very Oly, and from which (in the Welt-Indies, as in Carolina, &c.) they prefer forth an Oil, which is used, for External purpofes, and ferves also to burn in Lambs, but is harmful to be used with foil, as Diocto- rides fays, and yet I have been told by none in thofe Welt-Indies, that they eat it as Oil Olives, with- out any hurt or detriment; this may be true for all that I know, and yet I shou'd be leefs to make the Experiment.

IV. General Defcrib'd it after this manner. Rich- man, Palma Chrifti or Sik, from a long well branched Root, fprings up with a great round hollow Stalk, fine Origins or seven or eight feet high, of a brown color, dyed of diffolute Pulp, or upon green. The Leaves are great and large, divided into feveral fiffons or parts, fo- bioned like unto the Leaves of a Trear, but greater, and ftronger open like a Man's hand towards the top. There grow yellow flowers together like a bunch of Grapes of which the veraffiles are of a pale yellow color, and neither way without bearing any fruit, but the apertures are opened, bringing forth three corner- ed heads or bucks, in which are contained the Seed, as big as a kidney bean, of the color and shape of a certain Pernian which calts Cattled, called a Tick or Thoff.

V. The second, is feller Species of the Great Spurge or Palma Chriftii. It is like the former, but feller in every part, alto it grow in the fame ground, while Seed being ripe is moftly much little than that of the former. This Plant Clafius in his Exoticks, Lib. 2. Cap. 21. has taken notice of, and Bellarius in his Hortus Eftricenfis, has largly prepurged.

VI. The third, or American Great Spurge, or Palma Chriftii. This differs from the two former sorts, not only in the greatest, but also in the form, for as Monardus and Alldins fay, it grows to be much greater than any growing in Spain, whose fmall Leaves are almofit round, and larger than thofe of the feveral Species, but thofe which follow are broad like to the Palm of an hand, and cut in or Tones on the edges for the many parts into five Diffsions, something refembling or answering to the five fingers of a hand (wherebe probably came the Name Pemal菖iales, and is an appella- tion more proper for this Species, than for eather of the fede.) In the Seed there is fome dif- ference offe, which tho' the green or bucks are Tri- angular as other Spurges are, and the former Ric- clion, yet the outward back is no pricky or ra- gel but smooth, and of an Ofe color, the innermost Seed is felf being somewhat like the former but more black, and not flipted at all, and is full as Oly as the firft before decribed, and of which a great quantity of Oil is made for outward afer. Its flave-

VII. The Place. The firft grows with us in England and our Gardens, and was brought to us from America, but it grows also in the Countries of Europe, Asia, and Africa, in Asia, Egypt, and other parts adjoin'd to them, where is Balloonis in Olfayan. Lib. 1. cap. 18. fays, the Stalk grows to be as big as the Body of a Man, and as Tall as a reafonable great Tree, whose Seed cannot be gathered without a Ladder, its leaves not falling away in Winter, nothing of which we know in our Colder Countries. This Syrian or Egyptian Seed contains a violent heat in it, for the half part of one Seed being taken by a young Man of about 20 Years of Age, very much troubled with the Head- ake, purged him very forceably and caited the Pain; But by accident chewing the Seed in his Mouth (which he ought to have flourrowned without chew- ing) it fo vehemently inflamed his Chaps and Throat, that the Mouth of the Stalk, which he put him into a Fever and gave him an intolerable Thiff with a Fainting of the Spiritus, which con- tinued for the space of nine days, and then he dyed, notwithstanding he was under the care of three Plantiffes, who us'd all the means imagina- ble. The second and third kinds, grow in severall parts of America, but the peculiar I found in some Plantations in South Carolina, and Carrié- land. fays his firft Seed thereof came from the Bermudas, as before is hinted.

VIII. The Time. With us in England they are Sown in the beginning of April, and flower in the end of July and beginning of August, their Seed being ripe towards the latter end of the fame Month.

IX. The Quality. The Seed is only used being boiled dry in the fourth degree. It is inflammable, treenly Attractive, and strongly Emerid and Catharick.

X. The Specification. It is peculiar for the Cure of a cold Scrupy, Cephalalgia, Dropy, Jaundice, Scorbuta, Sicatica, Rheumattis and Gout.

XI. The Preparation. You may have, 1. The bull'd Seed. 2. A Drop of Oil of the Seed. 3. An Exprified Oil of the Seed. 4. A Cateplasm.

The Virtues.

XII. The bull'd Seed. Dioctoderis Eys fays, that 30 Seeds freed from the Husk, being braft and taken in Drink, or other proper Vehicule, does purge choler, water and flegm, and expel Aqueous humors abundantly from the Belly, provoking Urine also; but as Dioctoderis himself confesses, it troubles the Stomach, and overruns it mightily; yet with good Advice it may be gi- ven to strong and Vigorous Eysyes, correfcend with Anfeald, Carwanus, Fennel Seed, or Winters Colloids. So may be given in F发电, and the others are troubled with the Dropsy, Sicatica, Gout, Rheu- matifin, Kings-Evil, Melancholy, Jaundice, Mad- nefs, &c. because it draws water and flegm thronghly from the remants. Colloids in his Com- menatary upon Mefjes, thinks that the Dofe of 30 Grains or Seeds to be a fault in thofe who Coppi- ed out Dioctoderis, letting down 30 for 3, which later number is the uniform Dofe, which may be safely given. Clafius fays, he knowe divide the grains give of the small Seed, which came out of
of America, in a small quantity, as a Purge in many Diseases, which they also use as a Feast of Worth, because by the purging the Body well, they found it a great Remedy.

XII. The Dowelion of the Seed in Cook Brath. It is good for all the purges of the half'd Seed before related, the Dose of which is to be regulated according to the number of the Seeds.

XIV. The Express'd Oil of the Seed. Dowellion Seed, put into Cylisers, it opens obstructions of the Bowels, expels Wind, cures the Colic, and helps Fits of the Mother. Monardus Fays, the Oil of the Indion Seed, is found by daily Experience to Cure all diseases proceeding from Cold Caufs, diffuse Tumors or Swellings, difficulles Wind, cures the Colic and Mother, if the places griev'd be anointed therewith, and some few drops of it be taken in fat Chicken Brath. It wonderfully helps the Cramp, and Convulsion of the Nerves, and shrunk up Swellings, being anointed upon the places: It enters the Spleen, opens its obstructions, and takes away the hardness of the Belly by anointing the Sides and Belly therewith; it also helps Scares and running Sores of the hand, and cleanses the Skin from all manner of Spots, Blemishes, Scurif, Morphew, and other Deformities thereof. A Drop two, or three, given to Children troubled with the Worms, in Milk or Fat Brath, it kills and expels them. And Drop into the Ears, it cures deafness and takes away the Pain, Noise, or Ringing therein.

XV. The Cataplasm of the Green Leaves. Applied to themselves, or beaten up with Buty Meal or Flower, it cools and allays Inflammations and Swellings of the Eyes, and applied to Women's Swols and bad Breaths after lying in, it foaks them, softens the Tumor or Swelling, and diffolves the Conglutinated Milk, making it to run, or be drawn freely.

CHAP. DCLVII.

OF SPURGE OLIVE, OR

MEZEREON.

II. The Kinds. Authors make many Species of this Plant, we shall only Treat of the four following, viz. 1. Mezeron, Chamætea, Germeæa, Camerarii & Dodecanis, Daphnides Fachili, Daphnides륫 Icelandic vulgaris Gelfneri, Laureola familiæ Lantbræntis, Piper Montanorum Anguidæ, Laurea Voffili, & Mezeron Germanicus Labori: Our Mezeron, Dwarf Bay, or Dwarf Olive. 2. Mezeronorum Arbus, Chamæleona, Chamælea tricoccos, Widlow Wails. 3. Thymæa, Mezeron also by the Arabian, for they promiscuously call this Species by this Name, with the Chamælea of all Kinds, Spurge Olive, or Spurge Flax. The Berries of this, as also of the fifth kind, are for all the the Greeks such as above said, and in Latin, Cecrum Cudinum, which do they

c promote Priests Leaves, but smaller, paler, thicker, and fatter, and rounder pointed. The flowers appear before the Leaves, sometimes in January and February, clustering together about the Stalks at certain distances, which are small, consisting of four Leaves, very many growing together, and breaking out of the Branches (or at more) by themselves, of a modest color tending to Purple, and of a fragrant pleasant sweet smell. After the Flowers are pollinom the Berries, which are at first green, but being ripe, of a shining red color, which if they stand too long upon the Branches become of a blackish red, of a very hot and burning taste, inflaming the Mouth and Throat with danger of Swellding.

IV. The second, or Widlow Walk. Its Root spreads
Salmon’s Herbal. Lib. I.

Spreads its leaf in the Earth, but not very far, being of a hard and woody substance, which easily preserves, if it be not carefully defended from the Extremity of early Winters. It has a small thread of about three feet high. The whole Plant spreads it self from the Ground, into many flexible, tough, green Branches, with many small twigs, on which stand several small, narrow, long, dark green Leaves, like Privet, but smaller and blunter, which whole green all the Winter. The flowers grow at the ends of the Branches and are very few, they answer to be the Stems of a pale yellow color, and come forth between the Leaves and the Seed, made of three Leaves a piece. Which being poll there comes a small, blackish triangular berry, two or three in size, like the size of the Olive, and are of a hot biting taste, burning the Mouth and Tongue, as are also both the Rinde and Leaves.

V. The third, or Spurge Olive, properly so called, or Spurge Flax. Its Root is felt, Strophulus, Strophius, or Spurge. Though it is young, very like unto a Radish Root as Clubs says; but sowing when it is green tother, covered with a tough black bark. It is root up with draped tough Stalks, a Cub or two feet high, fat or smooth, sometimes in very good ground a yard high, of about the thickness of eons thumb, covered with an ochre colored bark, and spread out into many Branches, covered round in a manner with Leaves, which are many, small, narrow and long like Myrtle Leaves, or rather like unto the narrow Leaves of the Olive tree, narrower and less than the Leaves of Welden Well; something like to those of Elm, to which many compare them, but that they are larger and broader, being also clumsy, flat, and pointed, continually thickening on the branches, without falling off as those of the Camnelle, daid to the Tins of the branches grow many small Starlike flowers, consisting of four white Leaves apiece, after which come small round berries, which are first green, and when ripe of a red Coral-like color, but are a little more than round, of the kigeas of a Myrtle berry, with a pulp or fuliture like unto a Hawthorn or Cherry, in which is a white Kernel covered with a black and felt, yet brittle seed or skin. These are very hot and burning in the Mouth, like Mezacon.

VI. The fourth, or Mountain Spurge Olive. Its Root is long, and grows under the up part of the Earth. It grows up with a small Woody Stem, 3 or 4 or more feet high, branching out towards the top, into many small slender and tough branches, covered with a tough, hairy and glossy bark. These at the ends thereof with flares, fallers, and smaller round pointed Leaves than the shall or Our Mezecon, of a gravy green color on the upper side, and brown underneath, which falls away before Winter, as Our Mezecon does. The flowers are many, set together at the ends of the branches, greater than the former, consisting like wise of four Leaves apiece, of a light blue color, standing in small gruby bushes, of very thin foliage. The berries are small long grains, of an excellent red color, which afterwards turn black.

VII. The Place. The first grows very plentifully in many places of Germany, and naturally in most of the Wooded Lands in Poland and those Eastern Countries; and in great abundance in most of our English Gardens. The second grows in Spain, and in Provence in France, as also in Lan- guedock, in rough and defolate places, but with us only in Gardens. The third grows in Spain, and in Tuscany in Italy, and about Arent, in rough Mountains, and is sold in England, and in Gardens. The fourth grows on the Alps, in the Mountains of Savoy, from whence it has been brought to us, and Norfolk in manured Grounds.

VIII. The Times. The first flowers in December, January, and February, and their berries are ripe in August. The second flowers Early in the Spring, as in April and May, and the fruit is ripe in Autumn as July, August, and September. The third flowers not in Spain till July and August, and its fruit is ripe in September. The fourth flowers in April, if there is neither be temperate, and the fruit is ripe in Autumn.

IX. The Qualities. They are all of them in their Roots, Barkes, Leaves and Berries, hot and dry in the lowest degree; Appetitive, Inflaming, Attractive, and violently Emetic and Cathartic.

X. The Specification. They are especially good against invertebrate, Rumpen and rebellious Scrofulas, Dimple, Jaundice, Scrofulas, Rheumatisms, as also the obstructions of the Terms in Women, and Mähnulness.

XI. The Preparations. You may have these in.

The Virtues.

XII. The Decotion of the Roots or Leaves in For Bread. It purges putrid and watry humerus from the molt remote parts of the Body, and that there and about, as a great ingredient of the Great, Scrofula, Rheummitis, Dropily, Scoupy, Leoply, Evil, &c.

XIII. The Powder of the Leaves. When the Leaves are greedily beaten, the Powder is to be taken away out of it, and then it is to be reduced to a pulp powder. Doe half a Dram in an convenient Vehicle: if given to a Dram, it works as strongly as Colicosby, but it does work with innocent and rebellious Diabeticis, being officiated for all the purpoises for which the former Decotion may be given. The fine Powder may be kept all the year, if it be made when in a fair Day, with a little Spanish Juice of Liquorice, and then care fully dried.

XIV. Pills of Mezacon: Take of the Powder one Ounce; of WineWOOD in Powder 2 Ounces, with Honeied Water make a Mass of Pills, which dry carefully. They difflive not in the Stomach or Belly, but are for the most part voided whole. Mollas makes them thus. Take Powder of Mezecon Leaves, Pulp of yellow and Cheball Myrobalan, of each an Ounce; with Ammon and Pulp of Tamarinds diffiluted in Eindic water make a mass of Pills. These Pills are commanded against the Dropily, and they expel watry and Tartarous humors, but work violently.

XV. The Juice or Pulp of the Berries. Given to half a Dram in Wine, or Brash which is better, it purges all the watry humors, and has all the Virtues of the Decotion and Powder aforesaid. It taken alone it burns the Jaws and Throat, and therefore it ought to be swallowd in Hony or in a Raffon Stond.

XVI. The
XVI. The Grains or Seeds. Taken to 20 grains as Dioscorides says, they purge by Stool, Chole, Flegm and Water: but unless taken in a Raifon they burn the Mouth and Throat: for some persons half this Dose may be sufficient, and to some others too much. It Cures Melancholy and Malignis. They ought to be used with Caution, otherwise the Medicament may be dangerous, and therefore not to be taken without Corsehtes.

XVII. The Balsam. It is made of the Powder of the Leaves mixed with Honey. Or, It may be beaten up with a little Nitre and Vinegar. It opens Gouty Sores, and cleanseth and heals Old and Filthy Ulcers.

CHAP. DCLVIII.

OF SPURGE Wood, or TITHYMAL.

I. THE Names. It called by the Arabians Xaufer, and Erbulta, also Ethatis, and by Nofiacus, Sexbrand and Alphobrant in Greek. Tithymal, and Tithymalus Charactis (G. & Valerii, from his growing in Valleys and low and moist places of the Woods) also Tithymalus nemorofus. In English, Wood Spurge or Tithyual.

II. The Kinds. Authors make 14 or 15 Species of this Plant, but we shall only take notice of the following five, as being most familiar with us, viz. 1. Tithymalus major, Tithymalus Charactis major, Tithymalus Charactis major, Tithymalus Charactis minor, The faster Wood Spurge. 2. Tithymalus minor, Tithymalus nemorofus minor, The faster Wood Spurge. 3. Tithymalus dendroides, Tithymalus nemorofus dendroides, Tithymalus Charactis minor, The Lesser Wood Spurge. 4. Tithymalus minor, Tithymalus Myrifenus, Myrile Spurge. 5. Tithymalus dendroides, Tithymalus dendroides, Tithymalus Charactis minor, The Spurges.

The Descriptions.

III. The first, or Our Common Wood Spurge. It has for its Root a small bunch of Fibres or Threads, spread every way under the Earth, from whence arise up larger Stalks, with several other Stalks, a foot and half, two feet or more high, before with small, long, narrow Leaves, but shorter and softer than the next following, not much unlike to the Leaves of the Almond-tree, from which reason I suppose, Lobel called it Tithymalus Charactis Amygdaloides, the flowers are yellow, standing in each Cup of Leaves as other Spurges do, after which come Triangular heads, or Seed, Vesicles in which the Seed is contained.

IV. The second, or Our Greater Wood Spurge. Its Root is long and somewhat woody, spreading it self under ground but not creeping. It has divergent Spurge Wood Great.

Common Wood Spurge.
Salmon's Herbal. Lib. 1.

Spurge Myrtle.

Spurge Wood small.

The fifth kind is that of the Myrtle Woods, or of the Spurge Myrtle, which Leaves are small at bottom, larger in the middle, and ending in a somewhat small and sharp point. The flowers are small and yellow, but not so many, standing at the tops of the stalks, like the other Spurges, of which follow like heads and Seed. Dioscorides describes it after this manner. Ramulatu (Dios. Ille) hab Radices motiles dedraentes. Foliis eretis Myrii proximitis, ed majoribus, firmis, in Cacumine acutis, & pungentibus. Freidem tert alterius amis, Nicli limine, morbischer gutta. The Figure. We have given you from Matthiolius, which is before it comes to its flowering and seedling.

VII. The fifth, or Spurge Wood. Its Roots are not so great and long as some of the former, yet sufficiently spread in the Ground to sustain the whole Plant, which Lobel compared to a Myrtle shrub, for its magnitude, and form of growing, but not as to the form of its Leaves. The Stem of this Spurge grows upright to the thickness of a Man's Thumb, almost like to that of the Rose Spurge, from the bottom, being here bare without Leaves for 5 or 6 inches, and then it sends forth into airy branches of a figner thickness, some shoot hairy, and not red as the others, but white, on which grow narrow long Leaves of a whitish color, something like to the Sea Spurge, or rather the Alder, or Great Elisha, having larger yellow flowers and Seed, but in other points like to the root of this kind.

VIII. The third, which is Our Common, kind grows in most Woods in England, which are dry and warm; I have gathered it in Harrowby Wood near London. The second and third grow in Woods in many parts of Our Land, as also in France and Spain, and in several of Our Gardens.
Gardens. The fourth and fifth, grow with us only in Gardens.

IX. The Times. They all flower in the Summer Months, in June and July; and their Seed is ripe in the Months following.

X. The Qualities. They are all hot and dry in the fourth degree, vehemently Attractive, heating and burning, and very Emetic and Cathartic, on the other

XI. The Specification. They are good for the Cure of Dropsies, Coughs, Scirrhosis, Rheumatism, Kings-Evil, Leprosy, Jaundice, and other like involutions and desperate Diseases.

XII. The Preparations. The Milky Juice is the strongest worker, the Seeds and Leaves are next to them; and the Roots of most of them have the same Operation, but not so violent. The Mistletoe Spurge has the same effects but is weaker, and Venoms not so much. Now from all these you may have, viz. 1. The Milk or Liquid Juice, 2. A Decoction, 3. The Galls or Seeds, 4. A Tincture of the outward Bark of the Root, 5. An Oil by Infusion or Distillation, 6. The Corrosion, 7. A Distilled Water.

The Virtues.

XIII. The Milk or Liquid Juice. It purges with great violence both by vomit and stool; Purgatory and Waryey Humors, as all Choler and Melancholy from the Stomach, Bowels, and Joints; Evacuates the Humors in Dropsies, and takes away the Tastaneous matter which breeds the Stone in Krets or Bladder, Cough, Rheumatism, Sciatica, or Kings-Evil, but in Emaciates and Wastes the Body, and if often used, is apt to induce a Consumption. Three or four Drops of the Milk taken fasting, is often put into a Fog, and mix'd with thirst, and used by strong Country People to purge them. The Milk put into Hollow-teeth with a bit of Lin, (so as it touch none of the others) cures the Tooth-ache both effectually and speedily. The Milk laid upon any hairy place, takes away the hairs, but it ought not to lie long at a time, and the places are wash'd ought to be prudently distilled with Oil of Roses or Nightshade. It also takes away Callous or hard Skin, Knots, Warts, Coms and the like, being cautiously applied, they being left upon a near part of the Body. 

XIV. The Decoction in Tincture. It has all the Virtues of the Juice, but acts with much more gentleness, and ought to be given in small Doses, first, as in one or two Quarts, and so gradually encreas'd, as you find the Body is able to bear it.

XV. The Galls or Seeds. You may give them from 1 to 30, according to Age and Strength, they work roughly and with a great force, and are good against all the Difficulties the Milk or Juice is good against.

XVI. The Powder of the Outer bark of the Root (or of the Leaves) they ought to be first steeped a day and night in White Wine Vinegar to abate their Acridity, then dry'd, and afterwards reduced to Powder. Half a Drum of it taken in Wine or Hot water, purges all wrythy humors downwards, as all Choler and Melancholy, and is very profitable to be given to such as have the Melod, Cough, Rheumatism, Sciatica, Kings-Evil, Leprosy, Jaundice, Stone, Gravel, &c. And applied in Green Wounds and Recent Ulcers, it cleanses and heals them.

XVII. The Oil by Infusion or Distillation. It is made of the Milk, or of the Herb, Roots, or Seed beaten in a Mortar and boiled in Olive Oil at a moderate heat, till it turns Almonds to Grispeck, or repeating the same 2 or 3 times. It cleanses the Skin of all its deformities, as Freckles, Lentils, Tumors, Sunburning, Dicingoloring, Yellowness, Scarring, Morphin, and other like deformities, being anointed therewith.

XVIII. The Corrosion. All these Spures are hearing and Exalcerating the Skin, if but cursorially applied: and taken inwardly, Operate vehemently and sometimes execrate the parts, without great care and caution be taken. Moreover, they are offensive to the Heart, Stomach and Liver, that they break the Veins, and bring the Guts of their Mucous, and heat the whole Body so much that many times they cause Fevers. The first ill qualities are taken away (days he) by adding such things as strengthen the Stomach, Heart and Liver. Their second and third ill qualities are taken away by adding things which have a glutinous quality, as Gum Tragacant, Mucilage of Flawroot Seeds and Purfane. The fourth ill quality is taken away, by adding cold and moist things, as juices of Evil, Nightshade, Purfane, Sowwhistles, or Mucilage of Quince Seeds made with Vinegar, &c.

XIX. The Distilled Water. It cleanses the Face and Skin from all manner of deformities, being daily applied, more effectually than an English part of the Liquid Juice be added to it, as the inveteracy of the affect may require.

CHAP. DCLIX.

OF S P U R G E M a r f b.

I. THE Names. It is called by the Arabians Scberz, and Philae; in Greek θεάκα Σπαργαζ, in Latin Sperago palustris, Pityusa palustris; and in English, Marsh Spurge, or Marsh Efaule.

II. The Kinds. There are 3. Efaule major, Efaule minor Germanica, Pityupa palustris major, Great Marth Spurge, or Greater Efaule, which some will have to be Rulanda his Efaule, of which he made his Extrael: whether the Greater Efaule, or the Lesser Efaule, be the Efaule of Ru- landus is very doubtful; nor can I find any Author which can truly or certainly determine it, they are both of them very strong and potent Medicaments, and therefore in my opinion may indifferently be made use of; however that which any one by Experience has found to be best, he may stick to. 2. Έφασγας τη χρυση, Peppe, Pityupa purpurea palustris, Pepsum Dutecheunmpt, Pepism marsiana ilia obsipens Efaule, Pityupa Calcinus, Small Marth Spurge, or small Purple Marth Spurge.

The Descriptions.

III. The fifth, or Great Marsh Spurge, or Greater Efaule. Its root is of a blackish color on the out-

side
Salmon's Herbal

CHAP VII.

OF SPURGE S. 

I.
The Leaves, Inscribed "Great Yellow Spurge," were esteemed in ancient times as a medicine for the treatment of skin diseases and venereal complaints. They were also said to be efficacious in cases of colic, dysentery, and fever.

V. The Seeds of Spurge, Spurge, and their Roots are generally ripe in June and July, and their Seed are the same with those of Holland, but larger.
Chap. 660. English Herbs.

of Spurge Laurel.

I. The Name. It is called in Greek, Λιπροτρόφος, spurge; in Latin, Spurgia; and in Spanish, (A Laurisolumina familiaris;) also Lauria, (gargulis Lauras vel Lauras minor;) in English, Spurge Laurel; and this Plant is that which Linnaeus thinks to be the Ciceranum, monogram Theophrasti.

II. The Kinds. The chief Species Authors have

taken
Salmon's Herbal.

Lib. I.

The Descriptions.

III. The fifth, or Our Common Spurge Laurel. Its Root grows down deep into the Ground, and spreads also abroad with tough, long, white Stings, having woody. It rifes up usually with but one Stem, a foot and half, or two feet high, yet sometimes with more, which are very tough and pliant, covered with a whitish, thick, tough bark, branching forth into several Arms towards the Tops, on which are set many long, smooth, thick, somewhat broad and shining dark green Leaves, something like to very small Bay Leaves, but longer, fatter, and not with hard Vains therein as Bay.

Spurge Laurel.

Leaves large, The flowers come forth towards the Tops of the Stalks and Branches, and at the Joints with the Leaves, many set together, which are something long and smooth, ending or spreading into four small Leaves, of a whitish, yellow green color. After which comes small, round and something long black Berries when they are ripe, in which lies a white Kernel. Both Leaf and Flower, also Bark and Root, are very hot and Sharp in Taste, heating and burning the Mouth and Throat of such as take them. It keeps its green Leaves after, without feeding, all the Winter.

W. Gerard describes it after this manner. Its Root is woody, tough, long, and diversely parted, growing deep into the Earth. It is a Shrub of a Cadet height, and sometimes two or three feet high, spreading itself out into many little brush, which are tough and pliant, and covered with a thick Bark. The Leaves are long, broad, green, smooth, and of a darkish green, shining like Laurel, or Bay Leaves, but fatter, thicker, and without small, very many at the Top clustering together. The flowers are long, hollow of a whitish green color, hanging beneath and among the Leaves. The Berries when they are ripe, are black, with a hard Kernel within, which is a little larger than the Seed of Hemp, whose pulp or inner Substance is White. The Leaves, Fruit and Berries, as well of the Root as of the Stalks and Branches, do by their Sharpness and burning quality, Fire and Inflame the Tongue and Throat.

V. The second, or Candy Spurge Laurel. Its Root is white, small and crooked, from whence spring up three or four Crooked and bending bladish Stalks, thick jet with Leaves without any order, covering them about wholly, which are long and small towards the bottoms, but broader towards the ends, being thick and hard, green above, and grayish underneath. Bending very hot, and burning very vehemently both Mouth and Throat. The Fruit is very hot also like the former, and the whole Plant of low growth.

VI. The third. The fifth grows Wild in many Foreign Countries, as well as in many parts of England, but being brought into Gardens, it will abide and flourish very well there: but it is said to grow abundantly in the Woods in most parts of this Kingdom. The second was brought to us out of Candia, and propagates well enough with us.

VII. The fourth. The fifth flowers very early in the Year, even upon the Winter Tropic thro' all December, January and February, as the third, the fourth and fifth are. And the Fruit is ripe in May, and June; and the Plant is always green, enduring the coldest Seasons in Winter. The other Flowers more early in its Native Climate, but something later with us.

VIII. The sixth. The sixth flowers very early in the Year, even upon the Winter Tropic thro' all December, January and February, but being brought into Gardens, it will abide and flourish very well there: but it is said to grow abundantly in the Woods in most parts of this Kingdom. The second was brought to us out of Candia, and propagates well enough with us.

IX. The seventh. The seventh flowers very early in the Year, even upon the Winter Tropic thro' all December, January and February, but being brought into Gardens, it will abide and flourish very well there: but it is said to grow abundantly in the Woods in most parts of this Kingdom. The second was brought to us out of Candia, and propagates well enough with us.

X. The eighth. The eighth flowers very early in the Year, even upon the Winter Tropic thro' all December, January and February, but being brought into Gardens, it will abide and flourish very well there: but it is said to grow abundantly in the Woods in most parts of this Kingdom. The second was brought to us out of Candia, and propagates well enough with us.

XI. The ninth. The ninth flowers very early in the Year, even upon the Winter Tropic thro' all December, January and February, but being brought into Gardens, it will abide and flourish very well there: but it is said to grow abundantly in the Woods in most parts of this Kingdom. The second was brought to us out of Candia, and propagates well enough with us.

XII. The tenth. The tenth flowers very early in the Year, even upon the Winter Tropic thro' all December, January and February, but being brought into Gardens, it will abide and flourish very well there: but it is said to grow abundantly in the Woods in most parts of this Kingdom. The second was brought to us out of Candia, and propagates well enough with us.

XIII. The eleventh. The eleventh flowers very early in the Year, even upon the Winter Tropic thro' all December, January and February, but being brought into Gardens, it will abide and flourish very well there: but it is said to grow abundantly in the Woods in most parts of this Kingdom. The second was brought to us out of Candia, and propagates well enough with us.
Spurry Greater.

Chap. DCLXII.

Of SPERRY, OR SPURRWORT.

I. The Name. It has no Greek Name that I know of, but a Modern Author Tholin, calls it Arbuscula, Anthropodii: in Latine, it is called by almost all Authors Spergula: and in English, Spurry, or Spurrwort.

II. The Kinds. There are several sorts hereof, viz. 1. Spergula major, Spergula Sagina major, and by Blaschia, Alfine, Spergula altera vel Alfine Sylveftris altera, (yet it is no Species of the Chickweeds) Trioppius, Spergula Sagina Labellif (A Saginode facies callulis, from its good feeding or Fattening of Cattle.) The Greater Spurry, or Spurrwort; Frank-Spurry, or Fattening Spurry, because in Brabant and other parts of the Low Countries, Husbandmen Sow their Grounds therewith for the same purpuse, as also to caufe their Cows, and Ewes to give the greater store of Milk. 2. Spergula minor, Spergula Sagina minor, Spergula minima Daleslomii, The Leffer Spurry, or Sea Spurry. 3. Spergula minima, Spergula Sagina minima, Alfine Sperrgilla facie Bawhima, as it is called in his Peadamum. The Smallest Spurry, Red Spurry, or Chickweed Spurry. 4. Spergula Stellaris, Alfine, Stello- ria, Spergula monsteflaciis, Star like Spurry, English Spurry.

The Descriptions.

III. The first, or Greater Spurry or Spurrow. Its Root is small and Fibrous, perpetuating every year after Seed time. It lends forth several small, round and upright Stalks, not above half a foot high, on which at several distances or joints grow many small and narrow Leaves, set together in form of a Star, or of the Ram of a Spur, from whence come the Name. The flowers are many, small, and white, standing at the Tops of the Stalks, which turn into small round heads, containing therein small hard Seed.

IV. Gerard describes it after this manner. Its Root is small and Thready, from whence rises up a mean and low herb, very tender, having many jointed Stalks, on which grow Leaves in round Circles, like those of Woodruff, but longer and smoother, in form like the Rosell of a Spur. As

the Tops of the Stalks, grow small white Flowers; after which come round heads, with small round Seed like that of Turnep. This herb is found in Brabant, Flanders, and Holland for that peculiar use of Fattening Cattle, and to caufe them to give much Milk.

V. The second, or Leffer Spurry, or Sea Spurry. Its Root is small, long, woody, hard and rough, with small Fibres adhering to it. This in its form of growing does not much differ from the former, but that it has not so many long, and narrow Leaves set together at the joints of the Stalks. These Stalks are many, springing from the Root, which rise not above a Spur high, but do some what more lean downwards to the Ground, which together with the Leaves are more white, and of a fairer or brackish taste, if it grows near the Sea side, otherwise nothing so hoary, white or brackish at all. The flowers are fewer, of a white color, and the Seed block like the other.

VI. The third, or Smallest Spurry, or Red Chickweed Spurry. Its Root is small and long, which is yet large, considering the smallness of the Plant, with some Fibres or Threads adhering to it. From which rise up several small slender Stalks 3, 4, or 5 inches long, bowing down, or commonly lying flat upon the Ground, full of joints, and at every one of them two small, short, white Scaly Leaves, encompassing the Stalk at the bottom, out of which issue, between the Stalks and the said Leaves, come forth other small, green, sharp pointed Leaves without number. Towards the Tops of the Branches come forth at the joints the flowers, each upon a small Footstalk, which are small and red, and sometimes tending to a bluish purple, which being pulled away, small
of Starflower

I. The Name. It is called in Greek, Σταρφλωτός; in Latin, Ornithogalum; and in English, Star-flower, or Star of Bethlehem.

II. The Kinds. They are manifold, as:
1. Ornithogalum vulgare, Our Common Star-flower, or Star of Bethlehem.
2. Ornithogalum luteum, Bulbus Etruscanus, Bulbus Sublens.
6. Ornithogalum album uniflorum, Bulbus Uniflorus, The One Leaved Star-flower.
8. Ornithogalum maximum album, the White Star-flowers.
9. Ornithogalum Pennanti, or Star-flowers, which are called from its Original or Native place of growth: The Hungarian Star-flower.

Several Authors refer to this Alphodel, because its flowers are forked or divided, both in the early springing and decay of the green Leaves when the stalk of Flowers is up.

II. The Virtues. For that these people have found it sufficiently true by their daily use thereof.

III. The Description of the Green Herb. Blood, as it has all the Virtues of the Liquid Juice, but not altogether so powerful, but if the Bethi be strong, it makes good Milk in Nurses Breasts, and rectifies wonderfully in Consumptions.

XVI. The Cataplasm of the Green Herb. Being made of the Green Herb bruised, and then applied to Car fingers, or other places which are Car or Wounded, if the Wound is simple and not complicate with Accidents, it quickly heals it.
Chap. 663. English Herbs.

**Star-flower Yellow.**

It is very impatient of frost, and will not abide with us unless carefully preserved and defended against the cold of Winter. And the fometime in winter, yet it usually rises without springing forth into a blade, or so many leaves in a whole year, and then perishes, or if it does spring up, yet many times it does not bear, and most after their sixth bearing do decay and perish. Let therefore the root be either planted in a large pot or tub of earth, and husked all the winter, that so it may be defended from the frosts. Or else, which is the easier way, let the root be taken out of the ground every year, from September, after the leaves and stalks are soft, until February, and laid in some dry, but not hot or windy place, and then planted in the ground under a south wall, or such like defended places, which will then form up and prosper well, for that the greatest and hardest frosts are generally past after that time, &c.

It springs up with many broad and long green leaves, very like unto the leaves of the Oriental Jacinth, but being for the most part upon the ground, from among which rises up a round green stalk about two feet high, bearing at its top divers large flowers standing upon long stalks, and at bottom of every one of them a small flower pointed and green leaf. These flowers consist of six purely white leaves united, with six white stamens with yellow petals, which are laid open upon an ordinary Peduncle, with shining blackish heads in the middle, in form of a Star Jacinth, or of the fifth common Star-flower, having a pretty sweet smell but no color, which open every day at Sun rise, and close themselves again at Sun set, especially if they grow in the Sun.

**IV. The Fourth, or Yellow Star-flower.** It has a clumsy Bulbous Root, round, white, and somewhat oblong, very apt to perish, if it be any little while kept dry out of the ground, as has been found by experience. It rises up at first with one long round greenish leaf, which opens itself somewhat above the ground, and gives out another small leaf, larger and shorter than the first; afterwards the stalk rises from these at first, being 5 or 6 inches high, bearing at the top three or four small round green leaves, from whence among them come forth 4 or 5 small yellow Star-flower flowers, with a greenish Line or Strake down the back of every leaf, and some small reddish yellow Throats in the middle, which seldom yield any Seed. Formerly, that the flowers of this are on the back side of a pale yellow, striped with green, and on the inside of a bright shining yellow color, with Saffron colored Throats in their middles, and that the Seed is contained in triangular Vessels.

**V. The third, or Great Arabian Star-flower.** Its root is great and white with a flat bottom, after its fibres are gone, which yearly leaves; it has a very pleasant smell, and will not abide with us unless carefully preserved and defended against the cold of Winter. And the fometime in winter, yet it usually rises without springing forth into a blade, or so many leaves in a whole year, and then perishes, or if it does spring up, yet many times it does not bear, and most after their sixth bearing do decay and perish. Let therefore the root be either planted in a large pot or tub of earth, and husked all the winter, that so it may be defended from the frosts. Or else, which is the easier way, let the root be taken out of the ground every year, from September, after the leaves and stalks are soft, until February, and laid in some dry, but not hot or windy place, and then planted in the ground under a south wall, or such like defended places, which will then form up and prosper well, for that the greatest and hardest frosts are generally past after that time, &c.

It springs up with many broad and long green leaves, very like unto the leaves of the Oriental Jacinth, but being for the most part upon the ground, from among which rises up a round green stalk about two feet high, bearing at its top divers large flowers standing upon long stalks, and at bottom of every one of them a small flower pointed and green leaf. These flowers consist of six purely white leaves united, with six white stamens with yellow petals, which are laid open upon an ordinary Peduncle, with shining blackish heads in the middle, in form of a Star Jacinth, or of the fifth common Star-flower, having a pretty sweet smell but no color, which open every day at Sun rise, and close themselves again at Sun set, especially if they grow in the Sun.

**VII. The fifth, or Star-flowers of Naples.** The Root is Bulbous, great and white, and something flat at bottom, as drivers of those kinds are, which multiplies its self as plentifully into small Bulbs, as the first or Common Star-flower, or any other, increasing indeed too much, and therefore requires to be yearly taken up, and freed from its off-spring, with which it is apt to be pestered. This beautiful Plant rises out of the Ground very early, with 4 or 5 long yellow pointed whitish green Leaves, standing round together, with a white Line down the middle of every Leaf, and in the middle of every Leaf on the inside, these Leaves having something narrow, but long (three feet long in Italy, at Columbia 1 ft., but not of such an extended length with us.) In the middle of these Leaves rises up the stalk, about a foot and half or two feet high, bearing many flowers at Top, each flower standing in a little Cup or bush, which are divided into 3 or 4 parts, hanging down very long, about the heads for Seed: each flower is large, and consists of six long narrow Leaves, of a joining white color on the inside, and of a blushing pink color on the outside, the edges of each Leaf being white on both sides, and turning backwards towards the stalk.
Stalk, with six or other small Leaves in the middle, of a white color, bearing round together like a Cup, in the middle of which is a small white Pointed, about which stands six white Threads, Tips with yellow petals on their Tops, the whole flower being without any smell. After this, come forth great roundish triangular heads, which are too heavy for the Stalk to bear, and therefore lie down upon the Leaves on Ground, having certain Lines or Stripes on their out-sides, in which is contained round, black, rough Seed.

VIII. The sixth, or the One Leaved Star-flower. It has a small Bulbous or round white Root, which sends forth one very long Red leaf, or round green Leaf, but that for 2 or 3 inches above the Leaves, and is so much, and cutted, which sends forth a small or little Stalk about 3 or 4 inches high, bearing at its Top or 4 small white flowers, consisting of six very white Leaves apace, within which are five white Chives, Tips with yellow petals, standing about a small triangular head, which has a white Pointed sticking as it were in the midst thereof; the flowers of which flowers is much like the flowers of the Hawthorn.

IX. The seventh, or small Spanish Star-flower. It has a small white Bulbous Root which sends forth in the beginning of the year, five or six small long green Leaves, much like those of the common sort first, but narrow, and without any white Line or Stripe, whereas those others are striped or marked. From among which rise up one or two small Stalks, about two handsful high, bearing at their Tops, each Stalk about seven or eight flowers or more, growing each, one above another, yet so that they seem to make a loft or Umbel, with fat full long Leaves at the foot of every Stalk, the lower flowers being equal in length with the uppermost, each of which flowers has six Leaves of an Afb or whitish blue color, with a stripe or line down the back of every one of their Leaves, and so many white Chives or Threads standing about a bleith Pointed or head in the middle, which flowers quickly pass away without giving any Seed.

X. The eighth, or Great Leafless white Star-flower. Its Root is Bulbous, great, thick and short, somewhat yellowish on the outside, with a flat bottom like that of the Arabian Star-flower, but more hardy to endure the Winter, and more apt to encrease, whereby it is now grown common. It has many fair, broad, long, and very fresh green Leaves, which springing up out of the Ground very early, and are greater, longer, and greener than the Leaves of any Oriental Jasmine, which do abide green from the middle of January, or beginning of February, to the end of May, at which time they begin to fade, and the Stalk with the head of flowers begins to rise, so that it will have few or no Leaves at all, when the flowers are blown. The stalk is strong, round, smooth and firm, and rises by flowering time, to be 2 or 3 feet high, bearing in the Top a great bush or spike of flowers, upon long Footstalks, which spring from the first to be a great green Bar of Corn, for it is made pale Job's-horn, when the flowers are blown, it rises up to be very high, slender or plain at the Top of the head, and broad spread, and boughed below, so that it is long in flowering. The flowers open by degrees, for they flower first below, and so gradually upwards, confining each of five white Leaves, spread open like a Star. These flowers are Snow white, without any line or strew on the backsides, but nor so large as those of the Arabian kind, with a white Pointed or head in the middle, better with many white Tpered Tips with yellow Petals. And the Seed is black and round contained in the triangular heads together of the triangular heads, and somewhat grayish on the outside. It flows forth several narrow, long, whitish, green Leaves, viz. five or six, and that before Winter, which spread and gradually upon the Ground, narrow and of about a fingers length, much resembling the Leaves of Ewe Gilliflower, but somewhat roughish, and so white about Ground, from the midst of which, the the nee Spring, about April, when the little decaying, rises up a Stalk, about half Feet high, bearing at its Top, a spike of many white flowers, consisting of six Leaves apace, with green lines down their backs, very like to the first or Common Star-flower, which flow themselves open in May.

XI. The tenth, or Great White Spiked Star-flower. It has a large Bulbous Root, actually larger and white on the outside than that of the great white Star-flower, at Sect. X. after going; and in its form and manner of growing is much like the same eighth kind. It springs not up to early, nor are its Leaves so long, nor its stalk so long, hallow, whitish green Leaves, pointed at the ends, from among which rises up the Stalk, which is strong, and from a Root and half to three Feet high, whereas at the Top of the great Spike head, or bush of Star-flowers, standing spike Jamine, somewhat like the eighth Species aforesaid, flowering in the same manner by degrees, beginning first below, and at the Top of the great Spike head, and greater, and not so thick with these Star-like flowers, nor so far forced at the bottom, as that kind, nor are the flowers so white, but each of their Leaves a line or broad of green down their backs, and their edges on both sides are white. After the flowers are past, come Triangle heads like the others, containing within them such like black Seed.

XII. The eleventh, or Great Green Star-flower. Its Root is yellowish, something like to the eighth Species at Sect. X. after going. It has many whitish green Leaves, long and narrow, spread upon the Ground, which springing up in the beginning of the Year, and about until May; and then withering away, the Stalk springs up almost as high as that greatest white Star-flower, having many pale, yellowish green Star-like flowers, but smaller, and growing more feebly about the Stalk upon short Footstalks, but in a reasonable long Spike head, after which comes the Seed, which is like that in the last Section after going.

XIII. The twelfth, or Dwarf Yellow Star-flower. Its Root is Bulbous, white, and covered with an Afb colored Film. It sends up one only Leaf, two or three inches long, which is narrow, of a whitish color, and of an Acid Taste. Night to which rises up a small Stalk, about two inches high, bearing one or two Leaves thereon, between which comes forth small Star-like flowers, yellow within, and of a greenish without. The flowers being past, their come Triangle heads, in which is contained small reddish Seed.

XIV. The Places. The Titles or Names of many of them show their Original or Native Places, but with us in England they are all Nurt up in Gardens. The first grows Wild in Germany, Flanders and other Foreign Countries, as also in several parts of this Land. The second, Labour says, he found it in the Corn-fields in Somersetshire,
Chap. 664. English Herbs.

XXIV. Matthiolus says, that the field or common kind, are much eaten by poor people in Italy, both raw and roll'd, being preciser in Taffo than any Cheefnut, and ferve as well for a needf

of Starwort: or, Bubo-grass.

I. The Name. It is called in Greek Barrs, in Latin, After, Babonian, and Inguinalis, in English, Starwort and Bubo-nort.

II. The Kinds. Authors have given us between twenty and thirty kinds of this Plant, but the most of them growing in Foreign Places, and hardly ever to be come at by us, we shall here give you only such as either grow in our Gardens at home, or in force at our Foreign Plantations in America, or Welf-Indies, which are the nine following, viz. 1. FHosphorius, After Atticus, also called I fuppofe from the place, viz. Athens, where it grew in great Plenty. 2. After Atticus latens versus. 3. After Atticus Legitimus, Herba Stellata, Babonian and Ingualinis, The true After Atticus, or Yellow Starwort. 4. After Atticus Istobam, After Atticus flore purpureo, vel flore carnato, Purple Italian Starwort, or the Purple Marigold. 5. After Coqu zadis Lobelia, Hebaris, or Yellow Starwort. 6. After Virginianus latifolius, After Virginianus latifolius flore purpureo, After Virginianus latifolius, Starwort. 7. After Virginianus latifolius flore purpureo, After Virginianus latifolius, flore purpureo, The more early broad Lev'd Purple Virginian Starwort. 8. After Virginianus angustifolius flore purpureo, After Virginianus angustifolius flore purpureo, The later flowering narrow Lev'd Virginian Starwort. 9. After Virginianus angustifolius, After Virginianus angustifolius flore purpureo, After Virginianus angustifolius, flore purpureo, The later flowering narrow Lev'd Virginian Starwort. 10. After minor Nelus, After minor Nelus, flore purpureo, Nelus Magnificus. 11. After minor Nelus, After minor Nelus, flore purpureo, Nelus, the latter Purple Starwort, or French Purple Starwort.

The Descriptions.

III. The first or true After Atticus, or Yellow Starwort. Its Root is Ebruna or earthy, as a bunch of Strings, of a sharp and biting Taste, dying every year after Seed time is over. It rises up with two or three very hairy Stalks a foot and half high, with long rough or hairy branches. 3. The green Leaves on them, divided into two or three Branches, at the Top of every one of which grows a flat Sclay head, composed internally of five or six long, brown, rough green Leaves,Subsequently, the flower is fiff standing in the middle thereof, is made as a border of narrow, long, pale, yellow Leaves, set with brownish yellow Thorns.

IV. Gerard
IV. Gerard describes it after this manner. It has a fibrous Root of a bitter and sharp Taste. It has large broad Leaves like Verbaecum Salvifolium, or the Great Conyza. From among which arises up a stalk four or five hands high, hard, rough and hairy, beset with Leaves like Soap-Compons of a dark green color. At the Tops of the said Stalks, come forth flowers of affumigating and glittering golden color. And underneath about these flowers grow free or

Starwort yellow true.

six long leaves, rough and sharp pointed, not much in shape unlike the fifth called Stellas marina, which flowers turn into Down, and are carried away with the Wind.

V. The second or Purple Italian Starwort, or Purple Marigold. It has a Root composed of many white strings, which persists not as the former, but abides many years, with green leaves on their heads, and springs fresh again every year. It has many woody, round, bristly stalks rising from the Root, something higher than the former, or about two feet in height, sometimes standing upright, and sometimes leaning downwards, or which are set without order up to the Top, many something hard, rough, and long Leaves, for the most part round pointed, near the Tops they are divided into several Branches, at the Tops of each of which grow single flowers, made like unto a single Marigold, the outward border of its Leaves being of a bluish purple color, which are set about a middle Thrum of a brownish yellow, breaking out of a green Scaly head, like to those of Knapweed, but softer. These flowers abide long in their Beauty, and in the end wither and yield a soft Down, in which lies small, black, and flat Seeds, not much

Starwort purple Italian.

VI. The third or Fleabane like Starwort. Its Root is a small bush of strings and small Fibres. It rises up with brown Stalks, which are branched, about a foot in height or more, on which grow long and
Chap. 664. English Herbs.

1097

narrow Leaves, set singly thereon without order, not much unlike to those of the small Convyza. The flowers grow finely at the tops of the Stalks and branches, canet an inch high, on dusky yellow stems, on a few short stalks, with a brownish Thrum in the middle, which turn into Down, and their small Seed, is carried away with the Wind. There is another sort also of this Species, which has been brought to us from Virginia, and is very like to this now described, but it has smaller flowers.

VII. The Fourth, or Yellow Creeping Starwort of Virginia. Its Root is Striggy, creeping under ground, and spreading much. It rises up with a strong round Stalk 5 or 3 feet high, bearing at the joints two to four broad Leaves, like the Leaves of a small Fio Solis, but more pointed at the ends, and broader in feeling, being full of Veins: at the Top of the Stalk, which seldom branches out, grow one large flower, (riffing out of a green bush, made of Nine or Ten green Leaves) composed of many long and narrow yellow Leaves, with a brownish Thrum in the middle: which being paff, these follews Seed like to that of a small Fio Solis.

VIII. The fifth, or Yellow Starwort of Virgini-a with a Skinner Stalk. Its Root is knobbled and woody, with several long Strings adjoining thereon, and encroaches much at the sides, but creeps not, taking hold full in the Ground. It grows to be 5 or 7 feet high, with many Stalks, whose flower parts thereof, almost to the bush, is round, hard, and long, without any part upwards, having a small film or skin on four sides thereof (as is to be seen in some other Plants) up to the Top, which branches not, but bears several small flowers, as if they were Tafts at the foot, but being blown open, each flower is a yellow Star, consisting of 5 or 6 small and long yellow Leaves, with small, thick, yellow Verricles in the middle, each having a halfفش or a Point, or Point reflecting, flowers, which afterwards turn to be flat Seed, broad at the head, which are so finely set together, that they resemble the head of Seed of a Romanus, or greater.

The Leaves grow finely on a small Footstalk, on each side of the Stalk, being very like the former, of a dead or fallen green color, yet not altogether so large and broad, but a little longer pointed, and more rough at the sides, and are an inch and half long.

IX. The sixth, or Leffer Yellow Starwort of Virginia. Its Root consists of several white and long, hard-bills Strings, with small Fibres adjoining the same, appearing as if grown out of the sides by the seed. This as also the two former Virginia kinds as Sett. VII. and VIII. hope all their Stalks and Leaves every year, and shoot forth the next Spring, the Stalks grow up but with one upright small round Stiff Stalk 3 or 5 feet high, bearing two or three, green, long, shining Leaves at every joint, directed about the edges, but smaller than the former, rising on small Footstalks, and somewhat hard in feeling. At every joint with the Leaves on both sides, from the very bottom, came forth Branches half a yard long at half, with the like Leaves on them. At the Top of each Stalk and Branch, grow one flower, whose small round, green button under it, but several small grea Leaves on the head thereof, out of which breaks the flower, consisting of a dozen yellow small and long Leaves, encompaffing a middle deep yellow Thrum. The Seed, by reason it flowers late with us in England, has not been observed.

X. The seventh, or more early broad Leaved Purplish Virginia Starwort. Its Root is hard and Woody at its head, jetting forth long white Strings, and abides all Winter with green Leaves upon it, when the Stalks are restored, and dead-Br Leaves flanding upon short Footstalks, grow finely on the several hard, stiff, brown green Leaves of a yard high, they are broad and round at the bottom, growing narrower towards the point, and a little dotted about the edges, of a fresh green color on the upper side, and something yellow under-neath. Each great Stalk towards the Top, Branches forth into flowers, which stand in a Tou or Spike, with several small green Leaves below them on the Stalk: and the flowers being many, set on several small Branches, have a small greenish yellow bush, and a small pale Purplish flower coming out of it, consisting of several small Leaves and open like a Star, with several pale yellow Threds rising up like a Thrum, which turn into Down, with small Seed therein.

XI. The eighth, or later flowering narrow Leave’d Starwort of Virginia. Its Root is composed of several long white Strings, which lives long and encroaches much, losing all its Stalks in the Winter, but keeping a Tou or Spike of green Leaves all in the cold season, till it floats forth new Stalks the next Spring. It grows up with many Stalks, and higher than any of the others, bearing single Leaves at every joint, which are long and narrow, without any darts on their edges, and without any Footstalk at the bottom. At every joint from the middle upwards, it floats out very long Branches, and they oftentimes branched again: at each joint thereof stand single Leaves, but much smaller, and sticker then be before. The flowers stand finely at the joints and Tops of every Stalk and branch, which are small and Starlike in form, of a pale white color, with a purple Flora in the middle, rising out of a small green bush, which turn into Down like the former.

XII. The ninth, or Leffer Purple Starwort. Its Root consists of a bush of Strings and small Fibres, from which rise up many slender Branches, upright Stalks half a yard high, each Stalk set with many Leaves up to the Top, longer and narrower than any of the former or Purple Starworths, and something like to the Leaves of Linaria, or Toad-Flax. At the Top of each Stalk, stand three or four flowers, consisting of many small Leaves in a Starlike form, of very pale yellowish color, with a yellow Thrum in the middle, which pales into Deep Yellow, and is carried away with the Wind as the others are.

XIII. The Places. The fifth, second and ninth grow in Germany, France, and Italy, but with us only in Gardens. The third grows in many places in England, in moill and sandy grounds, but is also Nurt up in Gardens. All the rest grow in Virginia, as their Titles declare, as also in several other parts of Florida.

XIV. The Times. The three fifth and the last or ninth, flower in the Summer Months, viz. in June and July: The fourth and fifth flower in July, the sixth in August, the seventh in the end of August, or later if the year prove not warm, and the eighth, much later, viz. sometimes not till the end of October, or beginning of November, but yet sometimes a Month sooner, if the season be warm.

XV. The Qualities. They are temperate in respect to heat or coldness, dryness or moisture, diges-tive and nutritive.

XVI. The Specification. Starwort is dedicated to the Cure of Babes and other Tumors in the Groat, as Galen first, whence came the Names, Babonien and Ingualis. It also abates inflammations and colds pain.

XVII. The Preparations. You may make there-from. 7 A.
The Virtues.

XVIII. The Liquid Juice of the Herb. Bathed warm, or fomented upon places affected, it abates Inflammations, affluences Tumors, and eases pain in the part, particularly, it is of special use in Buboes and other Swellings of the Groin: The Throat being also outwardly fomented with it, and inwardly Compounded with the time, it is said to be proficuous against Inflammations of those parts, and the Quinsy. It is also good against the Piles or Inflammation of the Fundament, and the Falling out of the Intestinal Bells.

XIX. The Oil or Ointment of the Green Herb, and Hogs Lard. It cools Inflammations of the Fundament, also Inflammation of the Eyes, and the lachrymal Ducts, as scrofulous lachrymal ducts. It cools Swellings of the Throat, Scrophula, &c., being anointed therewith, but for these purposes I should advise to chose that fifth Species at Sect. XVIII. because of its Signature in the Root (which if Culling is to be believe, is much to be consider'd.) It is also good against Bubo's in the Groin, according to Galen's Opinion.

XX. The Cataplasm of the Green Herb. Applied it is good for all the purposes of the Liquid Juice, or Oil or Ointment, more especially if it be applied immediately after the fomentation or Unction. It has not only a digestive, but a cooling quality, and is very good to expurge Venereal Bubo's in the Groin, as all Antiquity has affirm'd. It also cures or gives ease in the Piles, and in a FEVER in ARS, after fomentation or Unction as attend'd being applied.

XXI. The Decotion of the Leaves of the Purple flowers in Water. It is good for the Pains and Sores in the Groin (appling after it, the Oil, Ointment or Cataplasm) and gives relief in a Quinsy, abating and taking away the Inflammation and swelling in those parts. Drink it takes away the heat and burning of the Scornish, and is said to cure the Epilepsy or Falling Sickens in Children. The Eyes being bathed therewith, and being also often in the day time, put into them, it abates their Inflammation, cools them and eases their pain.

CHAP. DCLXV.

OF STAR-WORT. Sea and Water.

I. The Names. It is called in Greek TOMANT by Dioscorides, and in Latine, Triplum: in English, Sea Starwort.

II. The Kinds. Authors make five or more kinds hereof, we shall only Treat of those which are more Common with us, viz. 1. Tripulum major, four vulgarum, Antilchus major Cordis, Amell Is palustris Columna, The Common greater Sea Starwort. 2. Tripulum vulgarum minor, Antilchus minor cordis, The Common lesser Sea Starwort. 3. Tripulum majorum, Antilchus brevior, Cordis, Tripulum minus Germanicum, The small Sea Starwort of Germany. 4. Stellaria Aquatica, Water Starwort.

The Descriptions.

III. The first, or Our Common greater Sea Starwort. Its Root is composed of several greater Stems, and many smaller Fibers, which grow deep, and thick in the Mud of the North Ditches, where it grows. It has many long, and something broad Leaves rising from the Root next the ground, smooth, fat, and thick, and of a bluish green color, somewhat like to the Leaves of Dorian Wood Wort, but much Jiffer. From among which refer

Satwart Sea Great.
The Virtues.

XIII. The Liquid Juice of Herb and Root. Injected into Green Wounds or hollow Sores and Ulcers, it cleanses, dries, and heals them, and mixed with Honey or Sugat, and /ofallowed, it is good to heal any inward Wound, Ulcer, or Ulcers, to help against Coughs, Cold, and Hoarse-

XIV. The Powder of the Root. Taken to two Drains in any proper, Vehicle it provokes Urine, and is good to cleanse the Keins, Ulcers, and Bladder of any Slimy or Turarious matter lodged in them. It refits poison, and therefore is put into Antidotes for the same purpose. Disofficaries says it purges, but Pliny and Wedel deny it; yet it is certain it expels watery humors from the Bowels, corrects Wind, and gives ease in the Gaping of the Guts, by discharging an Acrimonious Water from the same, especially in Droopess.

XV. The Ointment or Balsam. They have the Virtues of the Liquid Juice, in healing simple Green Wounds and Ulcers, and easie pain proceeding of cold in the Nervous parts, being applied and bound on the same.

XVI. The Caradie of the Green Herb. The Leaves being only bruised and bound to the place, heal Green Wounds after a singular manner, which Authors say, has been confirmed by Experience.

CHAP. DCLXVI.

OF STAVESACRE: or, Louse-wort.

I. THE Name. It is called by the Arabians, Alhara; Mabhebr; Marharazi, Marhe-

II. The Kinds. It is a singular Plant sui generis, which at this day, is called by the Natural Greeks, Ψαήψαμεν, or more properly Ψεψαμεν, i.e. Gressam Pedicularium; and thereupon Cordes on Disofficaries calls it Proprae-otinto: Philib lib. 26. cap. 13. calls it Una Tamina; but lib. 23. cap. 1. he says it is corruptly so called.

The Descriptions.

III. Its Root is long and Woods, persishing every year, after it has born Seed. It rises up with a short, but strong blishke green Stalk, spreading it self forth twentys ways; on which do grow great large Leaves, cut at the edges into three or four.
Savesacre.

The Virtues.

X. The Poffcr Drink. A few of the Seeds about 14. or 15. of them bruised and finetned into Poffcr Drink, and to taken, work very strongly upon the Stomach, expelling much vitious fliny grofs fluem. But it ought to be used with great Caution, because it heats extremely, and en-
dangers Suffocation by the Violence thereof: nor indeed ought it to be used without Correctives, and things which may mitigate the force thereof, that it may do no harr; and then it may be gi-
ven to fuch as are troubled with Scabs, Itch, Scurf, Morpboth, Leuce, Leprefy, Herpes, &c. Also used outwardly, it kills Lice, Crab-Lice, Ver-
im, Worms in the head, thare, or Amphilis, or a-
y other parts of the Skin.

XI. The Decotion in Wine or Water, or Ho-
ried Water. It is Emetick, and brings up grofs fluem, but with great Violence, When taken, much Honied Water ought to be taken after-
wands, and the Patient to walk up and down to avoid Suffocation, for which cause the Seeds of Savesacre, are very rarely used inwardly. This has all the Virtues of the former, whether used internally, or outwardly applied. It is good for all external deteclations of the Skin, as alfo to cleanse and heal foul Sores and Ulcers in the Mouth and Throat; If it is too strong, it may be weakened by mixing it with Vinegar.

XII. The Decotation in Vineger. If the Gums and Teeth be washed therewith it cale the Tooth-
ach, by drawing away the Rhenm which carried into great abundance, Any running Old Sores, or foul Ulcer being often waffil therewith, it cleanses, dries and heals them, and comofors and strengthens any weak parts, or Nerves overstrain-
ed, or hurt by any Accident.

XIII. The Eleyarily. Viuf a strong decolation is made of the Seed in Water (proper Correlatives being also added,) Then to the strained Decolation, Powders of Anfeeds, Cinemon and Liquorice, of each a fufficient quantity, with twice their weight in Honny, are added to make a thin Eley-
arily. Dole is a Dram at a time; it has all the Virtues of the Poffcr Drink and Decotion, and provokes the Terms in Women: being also dif-
olved in Plantane or Rofe Water, it heals foul Ulcers in the Mouth and Throat, by washing therewith.

XIV. The Powder of the Seed. Streewed upon Heads over-run with Lice and Nits, it kills and destroys them. Mixt with Vinegar or Wine, it is good to be rubbed upon Loofy Heads, also Loofy Apparel, and to drive away and destroy Lice, Crab-Lice, &c.
The Apothegmatorium. The Seed chewed in the mouth alone, or mixed with a few bits of the Root of Brythrium or Petalion of Spain, drives away abundance of Rheum from the Head, Brain, Nerves, Eyes, Nafi, Jaws and Teeth, and thereby eases the Tooth-ach, and the pains and distempers of those other parts.

The Ointment. The Seed in Powder mixed with Old or Hoglard, and made into an Ointment, is good against itch, Scarf, Morphew, Scabs, Leprolie, Lice, Crab-Lice, and other Vermin, being anointed morning and night on the parts afflicted, after they have been first bathed with the Decolion.

The Powders. The Seed beaten with Meal, and made up into Pilles with a little Honey, has the Virtues of the former Ointment and Elether, and laid in places where Rats and Mice frequent, will effectually kill or rid the place of those kind of Vermin, by their eating them.

Note. The Seeds are very truly dangerous to be taken inwardly, unless prepared, corrected, and given by a very skilful hand; and therefore, my Advice is, that such as are ignorant in Physick, should forbear their internal use, for that many times Death ensues upon the taking of them: but as to all their external uses, they are effectual and safe enough.

Of STITCH-WORT.

I. THE Name. It has no known Greek Name, yet some, as Dedonius and Lelbel, call it Ose, Ose, or Vasell, in Latin, Grassen Leucontheum, Dodonis & Eulphis, Grassen Floridum Camerarius, Grassen Ruffe, Tisch, Grassen uenarum Madelui, Aegyphia major Leonci, Cocephis arvensis Baubini, and in English, Stitchwort. But why Dedonius and Lelbel, or Baubini, should call it Holopium, i.e. i.e. Ose, or Alf bone, there is little reason for, seeing it is one of the most tender Herbs, and has no hardnes at all in it.

II. The Kinds. There are two sorts of this Plant, viz. 1. Grassen Leucontheum mayor, Grassen Floridum mayor, Cocephis arvensis giber fibre mayor, Baubini, The greater Stitchwort. 2. Grassen Leucontheum minus, Grassen Floridum minus, Cocephis arvensis giber fibre minor Baubini, The lesser Stitchwort. But why Baubini should account them in the kinded of the Cocephis, I see no reason, nor yet why they should be accounted any Species of the Gramina, there is as little argument, for that they differ so much in form from them.

The Descriptions.

III. The first, or greater Stitch-wort, has a Root which is small, jointed and Threaded, runs or Creeps in the Ground all about, with many small Fibres adjoining to it. From whence rise up several round slender Stalks, scarce able to sustain themselves, but by the help of Hedges, or other things which grow or stand near it, being full of joints, from which two small, long, hard, rough and pointed green Leaves spring, without any Footstalks. And so the Tops of the Stalks and Branches come forth many small flowers, confluent of white Leaves, and in form of a Star, such some white Threads in their middle. Of this sort, there has been some Varieties offered, as well in the Stalks, as in the Leaves and Flowers, some Plants growing greater or higher than others; in some the Leaves larger, and in others the Flowers being greater or lesser, and the Threads in the middle, some being pater, and some redder than others. The Seed is contained in small beads, somewhat long and sharp at their upper ends, and when it is ripe, it is very small and brown.

IV. The second, or lesser Stitchwort. This in its Roots, Stalks, Leaves and Flowers, grows very like unto the former, its chief difference being in that it is lesser, the Leaves lesser, the Flowers smaller, and each Leaf divided as it were intestines, making it seem to have more Leaves than the former. Otherwise in the shape of the Leaves and Flowers they are much the same; the Leaves are orderly placed by couplets together, and in good proportion, being of a whitish color; and the Flowers are made in form of a Star, which when they are faded the Seed follows, which is encloset in husks or small round beads, like Lin-Seed, but not so absolutely round, and the Chords or Threads in the middle of the flowers, are sometimes of a reddish or whitish color. In this lesser Species there is also some diversify in the Stalks, growing more upright, or else lying upon the ground, and in the flowers, some having white Threads in the middle Tips with black
Stichwort Small.

black, so that it makes the whole flower seem to be black, or else they are of a pale yellow.

V. The Places. They grow in the borders of Fields upon Bank sides and under Hedges, almost everywhere. The first kind grows more plentifully under Hedges, and upon dry Banks of Ditches, or the like. The second is more Common in Corn Fields, and elsewhere, in the more open and Champion Grounds.

VI. The Times. The first flowers a Month earlier than the second, which is in April. The second flowers not until May or June. But when they begin to flower, they continue flowering for about two Months together running.

VII. The Qualities. Stichwort is hot and dry in the first degree, a little sharp and biting as Garden faya, and in its use, very like to Miller, and of an Aromatic Property.

VIII. The Specification. It is said to ease pains and itches in the fides, and to take away the Dimness of the Eyes, or clear the Eye-light.

IX. The Preparations. You may make therefrom.

1. A Liquid Juice of the whole Plant.
3. A Powder of the Seed.

The Virtues.

X. The Liquid Juice. It is much commended to clear the Eyes of Dimness, and to take off Fills which begin to grow over the Sights, being daily three or four times a day drop into them.

XI. The Powder of the Herb. It is accounted of, to help Stitches and Pains in the Fides, being drank in White Wine from a Dram to 2 Drains.

some advise it to be taken with the Powder of
Acre:

XII. The Powder of the Seed. It may be given from a dram to 2 drams morning and evening, in White Pote or Labour Wines, for the former purposes and intentions. Some fay drank 2 or 3 times a day for many days together, that it curates fruitfulness in Women.

CHAP. DCLXVIII.

OF STOECHAS OR, CASSIDONY.

I. THE Names. It is called by the Arabians, Ασσοθαδος, Ασσοθαδας, Ασσοθαδος, Ασσοθαδες: in Greek, by Dioscorides Ομοθαδας: by

Galen Στοοθαδας: In Latin Stoechas and by most Stich- chen, also Stoechas Arabica, because the herb was brought out of Arabia. Dioscorides fays, it took the Name Stoechas, from the Islands Stoechades, (over against Aethiopia) where it grew in great plenty: in English, Stoechas, Cassidony, Stoechade and French Lavender.

II. The Kinds. There are two principal sorts of this Plant, viz. 1. Stoechas properly so called, of which we shall Treat in this Chapter. 2. Stoechas Carinae Chrispace, Yellow Stoechas, Gold Locks, or Golden Tutis, called also Yellow Tutis, of which we have already Treated, in Chap. 524. preceding; in which Chapter there is a good error committed by the Printer, in the Title of the fourth Figure, page 412. col. 2. which is there, True Gold Locks of Dis- corides, whereas that being the Fure of the fe- cond Species, in Title ought to be, Yellow Tutis: or Yellow Cassidony, and so you are entreated to Correct it with your Pen. Of the Stoechas properly so called, of which we Treat in this place, there are many kinds, but these which are chiefly to be found in our Gardens, are these following, viz. 1. Stoechas Vulgaria, Stoechas Matthioli, Stoechas Arabica, Stoechas purpurea, Our Com- mon Stoechas, or French Lavender. 2. Stoechas Vulgaria fere albo Bushini, Our Common Stoechas with White Flowers. 3. Stoechas longifolius li- gus: Clafy, Stoechas nudus Calycis ignis Linn: lo- beth, Stoechas capitatis foliatis Lugdunensii, Stoechas calycinus non foliatis Bushini, Stoechas Cassidony, or French Lavender with long Leaf'd Hedges. 4. Stoechas folio ferrato, folio crino Clafy, Stoechas, or French Lavender with dent'd Leaves. 5. Stoechas purpurata, Soft Purple Stoechas.

The Descriptions.

III. The first, or Our Common Stoechas or French Lavender. Its Root is somewhat woody, and will scarcely abide our Cold Winters; after it has flower'd and Seed'd, except in some places, unless an especial care be taken of it. As it grows with us, it is a more tender Plant than Lavender, and the whole Plant is something finer, but nothing so much as Lavender, it grows more like an Herb than a Bush or Shrub, and is seldom above
Stoechas common or Caffiony.

Stoechas or Stoechas is a species of herb native to the Mediterranean region. It is a member of the Lamiaceae family. Here are some of its characteristics:

- **Stems**: The stems are woody and grow to a height of about half a yard high.
- **Leaves**: The leaves are linear-lanceolate and change to a purple color in the autumn. They also have a hoary bloom on the upper side.
- **Flowers**: The flowers are small and purple, with a hoary bloom on the upper side, and the stamineae are purple, the pistillae being green.
- **Nectar**: The nectar is sweet, and the exudation of any of the species is accompanied by an odour.
- **Roots**: The roots are white, and the rootlets are hoary, with purple flowers and a hoary bloom on the upper side.
- **Stalks**: The stalks are smooth, hoary, and rather woody, with narrow leaves of a hoary color, or a little whitish, when they are ripe, and contain within them blackish brown seed.

**Useful Information**

**Herbaceous Plants**: The plant is useful as a herbaceous plant, and its use is described in the following text.

**Culinary Use**: The leaves are used in culinary purposes, and the plant is known for its medicinal properties.

**Medicinal Use**: The plant is used for its medicinal properties, and it is known for its effectiveness in treating various ailments.

**Cultivation**: The plant is easy to cultivate and is suitable for both indoor and outdoor cultivation. It requires a well-drained soil and ample sunlight.

**Harvesting**: The plant is best harvested in the autumn, when the leaves are purple in color, and the flowers are sweet-scented. It is harvested after the first frost, when the flowers are colorless, and the leaves have a hoary bloom on the upper side.

**Preservation**: The plant can be preserved by drying the leaves and flowers, which are then used for various medicinal purposes.

**Conclusion**: Stoechas is a versatile herb that can be used in various culinary and medicinal applications. Its purple flowers and hoary leaves make it a beautiful addition to any garden.
of their tendernefs, they ought to be look'd after 
with great care and diligence.

XI. The Salmons. They are hot and dry in the 
third degree: Aperitive, Attractive, Diure-
tic, Sormartic, Hartatic, Pelaric, Cephalic, Bre-
neotic, Cardatic, Uteric, Emmenagogick and 
Alyexpurgartick: but the twof of these plants 
is chiefly in use.

XII. The Specification. It opens oldultrations, 
cleand, ftrengthens, expels poftion, refills puf-
fation, combers the Saffes, ftrengthens the 
Head, Brain, and Nerves, is good againft all Cold 
Aches, Pains or Griefs, as Apoplexies, Epileptics, 
Palifes, Convolvulous, Vertigo's, Melancholy, is 
profitable againft all forts of Aymes, provokes the 
Tarms, refils Vapors and Fits of the Mother, and 
is good againft Coughs, Cold, Rheum, Caraffes, 
provokes Urine, and clears all the Urinary Vef-
els. Vena Fus is good againft difeafes of the 
Liver proceeding from bad Convection: and is 
profitable againft the Colick proceeding from 
Acid: Salt and Glaide Pfin, &c.

XIII. The Preparation. You may have there-
from. 1. A Liquid Juice. 2. An Effeine. 3. 
A Decotion or Infolution of Heads and Flowers. 4. 
A Syrup. 5. A Powder or Perf of the Herb or of 
that Part. 6. A Perf of the Heads and Flowers. 
7. An Oil by Infolution or Decotion. 8. The 
Fumes of the Herb Burnt. 9. An Acid Tincture of 
the Herb Heads and Flowers. 10. A Spirituous 
Tincture of the fame. 11. A Spirit of the 
Heads and Flowers. 12. An Oil of the fame by 
Difillation.

The Virtues.

XIV. The Liquid Juice. Syrups is faid to be 
as effectual as Hyflpop, for the Bref and Lungs, 
for Colds, Coughs, Caflars, Hoarfness, Wheez-
ing, &c. It is also a refifter of poffion, and the 
inficion of the Plague, and all other Infectious 
Difeaffes. Vena Fus has a quality of binding 
and opening, for which reafon it is good againft 
all thofe difeafes of the Lungs. The fpoce taken to 
be Spoonfuls or more in Water, or in any other pro-
per Vehicle, externates, clears, and ftrengthens all 
the inward parts and Bowels, as also the whole 
frame of the Body. Vena Fus fays, it clears, 
purges, and refolves all Oldultrations of the Liver, 
Spleen and other Vefera, hides purrefation, 
and corrects their incemperaure.

XV. The Effeine. It has all the former Vef-
tures, refites which it strengthens the Brain, 
Nerves, Head, and all other inward parts, cor-
rects and expels Flegm, and Melancholy, com-
fers the Saffes, clears the Heart, revives the 
Spirits, and is effential against all cold gripef 
in any part of the Body, all Aches or Pains 
wherever internal, as Colicks, or external as 
Gouts, &c. by 
taking it inwardly morning and night from one 
Spoonful to two in a day, and Vehicle, and outward-
ly bathed with it, the parts affecled. Authors 
affay, that Stecher has a Caraffick faculty, but I 
could never find it; and therefore they lay or 
advife it to be given with Vinegar of Squills (either 
the Juice or Effeine) againft Vertigo's, Epileptics, 
Meprimes, and other pains of the Head, at allo of 
the Stomach: and given with Latif Vnanes, or 
Sal Indicus, it prevails against Melancholy, and 
terrors and heirs accompanying the fame: for alo, 
it taken with Juice of Bugfols and Pinnips, it takes 
away the affeCtions and fadnefs at heart.

XVI. The Syrups. It has all the Virtues of the 
Liquid Juice, and is a more excellent Perforn, 
more efficaciously if it is made with Clarified Honey, 
or Sugar Candy, it is truly an excellent thing a-
gainft all fpecies of the Blood and Lungs, and 
used as a Vehicle to take either the Juice or 
Effeine in, it is not only effectual for all the pur-
pofes they are intendd for, but fo mixed, they pre-
vent against all fpecies of Aymes, whether QuoUidem, 
Terrian, or Quantum, more efficaciously whereFlage 
abounds. But they are faid to be hurtful for fuch 
as are hot and dry, and of a Choleric habit of 
Body, causing in fuch both Thrift and Fairting. 
This Syrup may be made of the Clarified Perforn 
or of the heads, and flowers boiled in Water, 
according to the usual method.

XVII. The Powder of the Herb, or of the 
Heads and Flowers. It has all the Virtues of the 
Juice, Effeine, Decotion and Syrup; but operates 
not with that speed, by reason of the greatnefs of 
its parts, and being eldgrift with fo many Earthy 
articles, of which a Caraffick Quantity in it, 
it is very weak and fafely, and therefore they ad-
vice it to be mixed with Myreobanit Indi, or 
Chelbi, or Sal Grenna, or Virgin Sulphur, to ex-
act the good qualities of this Herb. The greater 
the fpecies it is taken, the better it will refay if it 
is made stronger, if it is before-hand In-
tulfed in Whey, or in Wine, or Juice of Pippins, 
with a few Kalions of the Sun. The Doe is 
taken from half a Dram, up to a Dram and a 
evening in the Syrup, or other convenient Ve-
icle.

XVIII. The Decotions or Infolution in Whey, 
Wine, or Water. It has all the Virtues of the 
Juice, Effeine, Syrup, and Powders, but much 
weaker, and therefore is given in the larger quan-
tity, as to halfa Pint or more, and it they design 
it to Purge, it is mixt with a fpecies of the aforemen-
ioned Carafficks, by which it is made the more ef- 
ficaciable. It provokes Urine, and the Terms, and 
cleanses the Urinary parts.

XX. The Powder of the Herb or of the 
Heads and Flowers. Taken up the Nefthicks 
through the Bowels, it is good againft Aches, and 
pains from a cold caufe, gives cafe in Cramps and Convolvulous of the 
Nervous parts, and provails againft Palifes, and 
other like Weakefnesses affefting the extram parts; 
and菪ited upon the great and other 
proper Vehicle, externeates, clears, and ftrengthens all 
the inward parts and Bowels, as also the whole 
frame of the Body. Vena Fus fays, it clears, 
purges, and refolves all Oldultrations of the Liver, 
Spleen and other Vefera, hides purrefation, 
and corrects their incemperaure.

XX. The Infolution or Decotion. It is good 
againft Aches, and pains from a cold cafe, 
gives cafe in Cramps and Convolvulous of the 
Nervous parts, and provails againft Palifes, and 
other like Weakefnesses affefting the extram parts; 
and stalking upon the great and other 
proper Vehicle, externeates, clears, and ftrengthens all 
the inward parts and Bowels, as also the whole 
frame of the Body. Vena Fus fays, it clears, 
purges, and refolves all Oldultrations of the Liver, 
Spleen and other Vefera, hides purrefation, 
and corrects their incemperaure.

**Of STOCK-GILLIFLOWERS Garden.**

1. **The Names.** This Plant is called in Greek, Λευχοές (L. Violae alba, ex viola album, and Λευχοί) in Latin, Leucoium: and in English, Stock-Gillyflower.

2. **The Kinds.** We make but three generick kinds hereof, viz. 1. **Leucoium Hortense,** Giltstock-Flowers, of which in this Chapter. 2. **Leucoium Maritimum,** Sea Stock-Gillyflower, of which Chap. vi. next following. 3. **Leucoium Murale,** Leucoium Luteum, Keir, Wall Stock-Gillyflower, or Wall Flower, of which in its proper place in the Alphabet, W.

3. **The Garden.** These are first single, as 1. **Leucoium simplex, leucoium coloratum diversiflorum,** Single Giltstock-Gillyflowers of several colors. 2. **Leucoium sativum albo Leucoium simplex,** The single pale yellow Stock-Gillyflower. 3. **Leucoium Albidochlorum, The Dark or Dull single yellow Stock-Gillyflower. 4. **Leucoium albo-femineum genus flore simplici,** Another kind of single Stock-Gillyflower. Secondly the Double kinds as, 5. **Leucoium flore plano diversorum colorum,** Double Stock-Gillyflowers of divers colors. 6. **Leucoium sativum Luteum flore plano,** The double yellow Stock-Gillyflower. 7. **Leucoium flore plano variegatum,** The double striped Stock-Gillyflower. 8. **Leucoium albo-femineum flore plano,** The other double Stock-Gillyflower, of all which in Order.

The Descriptions,

IV. The fifth, or single Garden Stock-Gillyflower of several colors. Its Root is long, white and Woody, spreading divers ways; These single Stock-Gillyflowers they differ in the color of their flowers, yet are in leaf and manner of growing one so like unto another, that until they come to flowers, the one colored cannot be known, from another Stock, that which bears red flowers cannot be known from that which bears purple, nor either of them from that which bears white: and therefore One Description of the Plant will serve. It rises up with round Woody and Stalks, two,

Stock-Gillyflower Common.
which turn into long and flat Poles, iron, three, four, and sometimes five inches or more long, in which is contained flat, round, redish Seed, with granish Rings or Circles about them, being flat all along the middle 3th or Pod on both sides.

There is great Variety in the colors of the flowers: for some are wholly of a pure white color: others of a most excellent Creamen red color: others again of a fair red color, but not so bright, or intense as the other; some of a Purplish or Violet color, without any spot, mark, or line in them at all. There are again of all these colors, very variably mixed, as White mixed with great or small spots, stripes or lines, of a pure or bright red, or dark red and white with purple spots and lines: and of either of them, whole flowers are almost half white, and half red, or half white, and half purple.

The red of both sorts, and the Purple in the same manner spotted, striped, marked and marked with white, differing neither in form, nor substance in any other point.

V. The second, or Single pale yellow Stock-
Gilliflower. This is of no great regard, but only for its rarity and beauty of the rest, there being but little difference in this kind from the former, whether as to its magnitude, leaves, or flowers, or manner of growing, only this but greater leaves, and a pale yellow flower, almost white, but in all other respects alike.

VI. The third, or Dwarke, Doll single yellow Stock-Gilliflower. This seems to be a Wild kind of this Plant, and has like Roots with the former, but larger, longer, and greater Leaves than any of them, equally stiff or firm in the middle, and with a great number of flowers, as large or larger than any of the former single kinds, made of four large Leaves opposite, standing in such as long stalks, but of a dark, tall or slender yellowish color, after which come long, roundish Pods, in which bee somewhat long but rounder and greater Seed than in any other Stock-Gilliflower, and nearer both in Poles and Seed unto the Heavily, or Damsel flower. The Root of this does not equally perish after Seed bearing the sometimes it does.

VII. The fourth or other single kind of Stock-
Gilliflower, its Root is like to the former and dyes every Winter for the most parts, after it has borne Flowers and Seed, being seldom preferred. This kind differs neither in form of Leaves, Stalks, or Flowers from the former, finding that it oftentimes grows much larger and taller, so that whatever shall be both the greater growing together, shall scarce differ in the difference, only it bears flowers, whole, either White, Red or Purple, that is, of one color, without mixture of other colors in them, which are either single like unto the former, or very thick and double, like unto the next following, but larger, and growing with a greater variety of Flowers on the long Stalks. But this is to be understood, that this kind of Plants which bears double flowers, as they bear no Seed at all, so the double flower proceed from the Seed of this single flower's (which of all the single flower's kinds, is that only which Seed gives both single and double flowers) it being seldom increased by slips or cuttings (as the next double kind is) because this starts every Winter for the most part, but is to be produced every year, from the Seed of this single kind, which promiscuously brings forth, some

Plants single flower'd, and some double flower'd, which cannot be distinguishing one from another, viz. which will be single, and which will be double, till they are seen in flower, or in bud at first, for which reason the Seed of the single kind is allowed to be toosed, which is the only way to preserve the Species. But of the Seed of any of the former single kinds, never any double flowers were ever known to be produced, and therefore you ought to be care full in saving the Seed, to distinguish it from the Seeds of those.

VIII. The fifth or Double Stock-Gilliflower of Divers colors. This kind which bears the single flowers, grows not so great, nor spreads its branch so fur, nor are its Leaves so large as the double flowers of the former single kind, but is in all things smaller, and lower, and yet is Woody or Slowly like that: bearing its flowers in the like manner, many upon one Stalk, one above another, and very double, but not so large as those former double, which grow in a sort of stem, which are wholly either White, or Red, or Purple, without any mixture, or else mixed with Spots and Stripes, like the single flowers of the first kind, but more variably, and not in all plates alike, never bearing Seed, but is to be preferred and the settings of the young Sprouts or Branches only, taken in a fit Season. This kind perishes not, as the former double kind does, provided it be defended in Winter from the Extreme Cold, and put into North and North East Winds, and from the Snow falling or resting upon it. The former Stock-Gilliflower of divers colors, raised from the Seeds of the single kind or Sect. VII. are, as with the single, so with the double, in a manner that they ought not to be mixed together, but may be raised from the Seeds of these Plants alone, both to the former and latter.

IX. The sixth, or Double Yellow Stock-Gill-
Rower. It has long Leaves, or bony, or hair like unto the Stock-Gillflowers, the Stalks and Branches being also like the same, and not Green like unto the Wall-flower, to which else it might have been referred.) The flowers are fair and double of a pale yellow color. The whole Plant is tender, as the double Stock-Gillflowery are, and ought carefully to be preferred in Winter from the Cold, and that rather more than the next double, left they perish.

X. The seventh, or Double Striped Yellow Stock-Gillflower. It is in all things like the former flower, striped, and has the same diversity of Colours, only differing in that the flowers of these are all striped or marked more or less with white, which adds very much to their beauty and effect.

XI. The eighth, or other Double Stock-Gill-
flower. This has no single of the kind, and is inferior in all the parts thereof, than those raised from Seeds: the flowers are of a smaller, but thick and double, of the same or like color, but the other being both for single colors and mixed, many of them much more, and better striped with white than that of the former kinds.

XII. The Places. They grow with us only in Gardens, and that almost throughout all England: But it is said that some of the single kinds in Foreigna
Chap. 669. English Herbs.

Foreign Countries and Warm Climates grow Wild.

XIII. The Times. They begin to flower in about half an inch, in 3 or 4 places, equally distant from each other, according to the bigness thereof, which Peal as far as it is full, and turn up; then cut off the naked wood part close to the kind which is turned up: make a wide hole in the Earth, and for the plant therein 2 Finger deep, with the bark spread open, round about the end thereof: then cover it, which let be shaded for some time; and watered: if the Ground be any thing good, it will grow and prosper very well. This certainly is the best and most absolute way to raise double Stocks of any of the kinds: and in like manner you may cut and for Slips of Wallflowers, or of any other Woody Plant, which will grow well. They may also be encysted by laying the slips after the manner of Carnations and Clavellifloras.

XV. Among these raised from Seed, you will have many and double flowers, which may be peculiar in the kinds, which will be rounder and larger than those which will prove to be single: those double ones you ought to remove into your Garden, taking them up carefully, not breaking the Roots, and with some Earth about them, which being a white Slated and Watered, will grow and bear flowers, as well as if they had not been cut at all removed. Those with single flowers must stand for Seed, which is to sit in every year, to preserve the kinds; for after they have born flowers both double and single commonly die.

XVI. The order first of all, Stock Gilliflower, which bear so Seed, nor have any single of the kind, are to be encysted by slips only: those double kinds, being not only apt to grow, but also continue longer than those which are raised from Seed; but as it is in Carnations and Clavellifloras, so it is in these: those from slips, being more easily obtained, has caused the latter from Seed, to be neglected, and almost quite lost, notwithstanding that one Plant from setting, is a much more noble kind, and worth five of those raised from Seed.

XVII. Some think that the Double kind raised from Seed, are not to be prefer'd longer than their first year of bearing flowers, but that is a mistake: for many of those double Plants have been preserved from the beginning of this kind, as well as the other. 'Tis true, the Old Plant being run up all to flower, does commonly the next Winter: but the currying will grow, and bear the next year, as well as those that are raised from Seed, which is to be done in this manner following.

XVIII. Take choice of such Branches as do not bear Flowers, which cut off some distance from the Stock, so that they be not too long: then slit down the bark at the end of the slip, about half an inch, in 3 or 4 places, equally distant from each other, according to the bigness thereof, which Peal as far as it is cut, and turn up; then cut off the naked wood part close to the kind which is turned up: make a wide hole in the Earth, and for the plant therein 2 Finger deep, with the bark spread open, round about the end thereof: then cover it, which let be shaded for some time; and watered: if the Ground is any thing good, it will grow and prosper very well. This certainly is the best and most absolute way to raise double Stocks of any of the kinds: and in like manner you may cut and for Slips of Wallflowers, or of any other Woody Plant, which will grow well. They may also be encysted by laying the slips after the manner of Carnations and Clavellifloras.

XXI. After you Plant your young Stocks, do not for them immediately in the desired places for them, but fill whole Beds with them, placing them at half a Foot distance one from another, where they continue as in a florid Nursey. The Stocks begin to deflower themselves towards the latter end of September, if Planted in Eton: sometimes it is later, and now and then not before Winter. For they are in no Effect, unless they be double; and since Nature has imparted to them all that advantage, this Method is taken that having raised them, and found out which of them are double, we may order them according to the following Directions:

XXII. As soon as the Stock appears to be double, prepare Pots or Boxes 16 Inches Wide every way, which fill with one half Earth, the other half Old Mold mingled together, and press'd down with your hands, left it should chance to sink after the Flowers are Planted, and to make an unevenness in the Superficies, which ought to be avoided: fill the Pots 6" or no higher than within four Inches of the Top, for the Vacancy which is left is to receive the Foot of the Gilliflower, which we draw up either in Turf, or with no more than its Roots.

XXIII. If it is raised with the Turf or Earth about it, then sink a Spade down, within 1" of the Master Stock, and plucking the Spade up, do the same on the other side, displacing it so, that it may go flopping under the Roots, and at every turn have the flower a little, by some way.
some firm Stocks of the Spade at the Top of the handle. Now observe, if the Roots of the flower be quite detached from the Earth, it is best to bend down your hands on both sides of the Turf, and with your fingers open or stretched as wide as possible, raise up the whole, and before it is placed in the Pot, Tuh, or Cist designed, let another person be ready to cut off those ends of Roots which are too long for the Turf.

XXIV. 11. Then set the Foot of the Stock in its designed Place, directly in the middle of the Veld, taking care that the Turf or Earth fall not under it: But if it should chuse to depend a little, keep one hand close upon it, and in the other take some of the Composed Earth as before placed, with which cover the Turf round, pressing it gently down, and so fill up the Pot within an inch of the Top, calling pure Mould ou it, and uniting the superficies as evenly as may be, which done, Water the Plant, and remove it into the Shade, till it has taken Root again, after which place it in the Sun, in the Place where you design it shall stand.

XXV. 12. If you don't design to Plant your Stocks with the Turfs about them, then only place them up by the largest Stems, and carefully clip the Roots which are too long, after which Plant them, according to the Method before prefcribed.

XXVI. 13. Since we only use that Seed, which is of the belt kind, you must take care, before Winter comes, to have some of the Prodigious China in Pots, so that you may be able to live the Seed the year following: for know, that Stock-Gillfloweres are only in Preparation (the full year after they are Planted) to produce Flowers and Seads the year following; so that without this care, your will often be unfurnished.

XXVII. 14. We Plant them in Pots or Cares, either, 1. because we design they should continue there always, or, 2. with an intent to remove them again in the Spring, to replant them in the borders, or other parts of the Garden, where they may make the belt flow. But when we would have them remain long in Flower, we place them in Pots so that they may be removed upon occasion, into the Shade: and if the Pots are of right Dutch Ware, and of handles neat, and placed in good order, they will be a regular Ornament to the Garden.

XXVIII. 15. In case the Stocks are not markt the first year, after they are Planted, so that you cannot judge whether they will beingle or double, you must be careful during the Winter, to preserve them with a covering from hard Frosts and Cold North and North-East Winds, which might possibly Kill them. And these which arc in Pots are to be freed from the same inconveiences, either in Green-Houses, or in some other place, of a Southern Situation, which is warm and not moist.

XXIX. 16. Stocks ought to be Sown in her Beds, as we have declared at Ser. XXIII. aftergoing, but you may sow them in the Naked Ground also, which is well Till’d, but then it ought not to be done till the middle of April or later, by reason of the Cold Weather, which is not over many times before that time: but whether they be Sown in her Beds, or in Naked Ground, they ought to be sufficiently Watered and Weeded, that nothing may hurt their growth.

XXX. 17. The Flowers set in Pots to be preserved from Frosts, and Cold Weather, are thus to be removed. Dig a Hole with a Spade or large Trowel, about as broad and deep as a Hat Crowned, then lay your hand flat upon the superficies of the Earth in the Pot with a Monitor, that the lower part of the Stems, may be just in the middle of your fingers, turn the Pot upside down, and make it a little, till you perceive the Earth to be hard, then bring your hand down for insie the Pot quite off, and holding the Plant in both your hands, carry it gently to the Hole dug for it, where having placed it as it ought to be, fill the whole up with Earth, and water it, after which, you will find it thrive and flourish to your Satisfaction.

XXXI. The Virtues. According to Authors, they are of the same Qualities, Specification and Virtues of the Wallflower, of which in it proper place, and as their Natures are much the same, so they are esteemed as Edificial to all intentions and purposes, they are hot and dry in the first degree, Abilities, Apply this Haply, Spurges, the Naphrills, Ylkerills, and Neuroficks, and of thin and substent parts.

XXXII. The Specification. The Flowers ease the hardnecess and pains of the Wombe, provoke the Terms, expel the Birth, Afterbirth and Dead Child, open Ophrills of Liver and Spleen, emit the Reins and Urinary paffages, provoke Urine, help in the Strangury, and are add to strength by Panlyrick Members.

The Virtues.

XXXIV. The Liquid Juice or Essence. According to Gales, they are of a cleansing quality, and of thin parts, they open the Ophrills of Liver, Spleen, Reins, and Womb, provoke the Terms, help the hardnecess and pain of the Mother, expel Birth, and Afterbirth, and Dead Child, strengthen and restore the Viroes, and any external part weakened by the Palsie, overstraining or any other Accidents. Drop’d into the Eyes, they cleanse them from Milis and Clouds, which turn her hinder the sight, and take away such Films, which are beginning to grow over the Eye. Dole two Spoonfuls or more morning and night, in a Glass of the Diluted Water sweetened with Sugar, or with Syrupus de Aethis in case of the Stone of the Gravel, or other Vatrous matter in Reins or Bladder.

XXXV. The Decollation of the Heads of Flowers in Wine. It may be made of them either Green or Dry, it relieves the Intempedation and hardnecess of the Liver and Spleen, and has all the Virtues of the Juice or Essence. Dole from a quarter to half a Pint morning and night.

XXXVI. The Powder of the Seed. It has the Virtues of the Juice, Essence and Decollation: and may be given from a Drian to two Drains, made up into an Elechusy, with Rob, or Pulp of Jasper Berries, or any thing for a Vehicle, which has Aloftive, Diiuric, Tilhuich, and Dickistle qualities.

XXXVII. The Gargarism. It is made of the Decollation of the Heads of Flowers in Vinegar, and sweetened with a third part of Honey, and
The Descriptions.

III. The first or Purple Sea Stock-Gilliflower. It has a very long root, thrusting it self deep into the Earth, from which rises up thick, fat, soft and hairy Stalks. The flowers coming forth from the Stalks near the Ground, are long, soft, thick, full of juice, covered with a downy hairiness, and fringed somewhat deep on both sides. The Stalk is set bire and there with like Leaves, but softer. The Flowers from as the tops of the Purple Colour, compact of four small leaves, of a light Purple Colour. The Seed is contained in long crook'd Ods, like those of the Garden Stock-Gilliflower.

IV. The second, or Levant Stock-Gilliflower. Its root is white, and grows deep into the Ground, spreading it self about, growing yearly when it is in Seed, but perishing afterwards. It rises up at first with several lines and somewhat broad leaves, a little unevenly divided or waved about the edges, which fo continue the first Year after Sowing. The Stalk rises up the next Year to be about two feet high or more, bearing all those leaves in which it first had, which do then grow less situated or ordered than before. At the top stands many Flowers made of four Leaves a piece, of a decided Purple Colour, having but a little smell, and is very long and narrow flat Pods, in which are contained flat Seed, like that of the common Garden Stock-Gilliflower, but much larger, and of a dark or blackish brown colour.

V. The third, or broad leaf'd Sea Stock Gilliflower. It has a long root, running very deep into the Earth, with an equal number of fibres or Strings coming from the same: From which spring forth many broad leaves lying upon the Ground and broader than those of the other Sea kinds, harder also in feeling, and as it were rugged, more hairy, and finely dent'd about the edges. From among which, rises up several round hairy Stalks, about a foot high, bearing at their top several Flowers of a purplish brown colour, much the shape of the Garden, after which follow small long Pods with brownish flat Seed in them.

VI. The fourth, or Great Sea Stock-Gilliflower. Its Root is long, running deep into the Earth, with many branches springing from the same. It has broader long thick hairy leaves, lying on the Ground for the first Year, some of them being cut in as the one edge, and some as both, with more goth, and some not at all. The Stalk rises up the next Year about a foot high or more, which spreads it self into diver's branches, yet all of them whole, and rather bending downwards, than bending upright, on which grow but few leaves, little or nothing Dent'd or cut in, at the tops of which, grow several Flowers of a pale Purple Colour, dressing near to the Color of Red Wine Laces, which small flower after the Sun is done, than in the day-time. The Seeds which follow, are long and fow'n

VII. The fifth, or Great Sea Stock-Gilliflower. Its Root is white, hard, long, and spreading into many Branches, which abides not after it has yielded Seed, but perishes as the other Sea kinds do. It has broader long, thick, whitish soft leaves lying upon the Ground, one within another in a round compass, and are fatter than the other Sea kinds, or those of the Garden kinds in the same way; the flowers are also, or cut in evenly on both sides, into deep dent's, not much unlike to the Snag of a Buck.
Stock-Gilliflower Sea-Small.

many Branches, on which grow soft woolly leaves, flowerer, narrower and softer jagg'd, than those of the Great Sea-Stock. The flowers which grow at the tops of the Branches, are purer than the others which grow lower, but consist of four Leaves only, like the reflex of a fresh red or crimson color, which upon their fading, seem yet to bee deeper, and losing a greater Smell than those of the other kinds: After which, in their places, come fortifying Pots, in which are contained the like red Seed.

II. The Places. The first was gathered by Mr. George Bawler, upon the Rocks at Aberdyne, in Meri methin in Wales, and possibly may be found near the Sea-shore about Colchester, also in the Isle of Man, near Welf-Cherfe, and near to Weylon in Oldenwet, Laniaire. All the old are found growing on the Sea-Coffs of the Lecuat, and other Foreign Countries; but with us they grow only in Gardens.

X. The Times. They all Flower all the Summer Months, from May, through all June, July and August, and the Seed comes to ripeness in less than a Month after.

XI. The Qualities, Specification, Preparations and Virtues of thefe, are accounted the fame with thofe of the Garden Kinds, treated of in the former Chapter, faving that they have not altogether fo sweet a Smell; but in Galen's Judgment they have all of them a clearing property, and are of thin and label parts.

STOR-WORT, see Sorrel-Wood, Chap. 641. STONE-BREAK, see Saxifrage, Chap. 674. STONE-HORE, see Stone-Crop, Chap. 671. STONNARD, see Stone-Crop, Chap. 660.

CHAP. DCLXXI.

OF STONE-CROP, AND WALL-PEPPER.

I. THE NAME. It is called in Greek, διον τος γούδιος Sedom minus, (because it is a temperate) in Latin, Hellebres, and Vermicularis; in English, Stone-Crop, and Wall-Pepper.

II. The Kinds. Authors make many sorts of this Plant, as, 1. Hellebres, Hellebres minor, Hellebres maior; Sedom tertium Dioscoridis, Sedom Cauflicum Clafsij; femperivium minimum, Daffylion secundum vel tertium Columbam, Azione vero Cordis, Azacion minus feruid; galat Thalij; Small Stone-Crop, or Wall-Pepper. 2. Illechra infipida; Vermicularis infipida Thalij; Azione minimum Cordis; Iiphid Stone-Crop, or Wall-Pepper. 3. Sedom minus album Lahei, Summer Stone-Crop. 4. Vermicularis florum albo Camerariij, Sedom minus Jemina Paelbiji, Laguanmefiis, auquamque Sceperivium minus album Braunfeli, Sedom minus primum Clafsij. The Greater White-Flowered Stone-Crop with round pointed Leaves. 5. Sedom minus Clafsij, Vermicularis Daffyphilum; Azacion Daffyphilum florum decemflorum Laguanmefiis; A Smaller White-Flowered Stone-Crop. 6. Vermicularis flophiiides, Sedom minus quantum Clafsij, Azacion flophiiides Lelabij; Azacion minus florum latius refluente Camerariij; Stone-Crop with turning heads. 7. Sedom minus florum rubiante dodabij, Sedom minus terium Clafsij; Sedom palaffyre Clafsij; Sedom minus quantum Tragiij; Field or Marth Stone-Crop.

III. The
The Descriptions.

III. The first or small Stone-Crop, or Wall-Pepper. It has a long, slender, floriferous or straggling root, creeping under the Earth not very deep. It* grows like the other Stone-Crops, with very many and slender Stalks, and small roundish 8eat thick leaves set thick upon them, or the tops of which, grow small pale yellow bloomes in Tuffs, as the others do. The taste hereof is very sharp, but and biting upon the Tongue, by which it is chiefly distinguished from all the rest; *tho' it is also distinguished in some measure by its form, being a small Plant, and its Stalks very thick set with small, fat, or thick leaves at afire, its Root springing up from its Fibres, and so spreading very far, quickly taking up much Ground.

IV. The second, or Infidip Stone Crop, or Wall-Pepper. It is a small Plant like the former, growing altogether like it, in Leaf, Stalks, and Flowers, which are of thefe, yellowish, and it only distinguished by the Tuffe from the first, this being nothing biting, but as it were unprofitable, and without any Taffe.

V. The third, or Summer Stone-Crop. Its Root is small, floriferous and perishing. It has on small Stalks, which spread themselves out into many Branches, many thick, round, long and juicy Leaves, set together without any order, the Branches being stored with many yellow Flowers at their Tops.

Stone Crop White Flower'd:

AND

Prick Madam Common Greater.

VI. The fourth, or Greater White Flower'd Stone Crop, with round pointed Leaves. Its Root creeps like the rest, and its Leaves Berkeley with its Stalks every Year. It creeps upon the Ground in the same manner as the others do, with slender Stalks and long round Leaves upon them; a bluish green color, not sharp, but round pointed, forming like Wheat-Corns, or Fine Apple Kernels, being firmly set thereon; at the tops of which, stand small white Star-like Bloomes, in small Tuffs, or starchy Umbels. This very much resembles the Greater Prick-Madam, in Chap. 578. Sect. *7, after going, and differs chiefly from that in the Flowers, these here being white, those being yellow: And therefore the Cut here placed, may in difference serve for both Species.

VII. The fifth, or smaller White Flower'd Stone-Crop. Its root in the manner as the former, creeps and flowers forth in divers places. This has such as Stalks with Leaves together, as that at Sect. VI. above, so that it is hard to distinguish this Plant from that, or the Greater Prick Madam in Chap. 578. Sect. 7. after going of Iron Bank, or til it comes to Flower, which there may be differen
ded to differ from them, only in the turning of its many Leaves, which turn or bend like the Tail of a Serpent (whereas the Name) or other Herbs which are resembled to it. Leath has another whole Heads turn round, which he calls Haremades.

IX. The seventh, or Field, or Math Stone-Crop. Its Root is long, slender, creeping and floe

VIII. The Plants. The first that it grows naturally on Old Brick, Stone, and Mud Walls, and other Barren, Watt and Unfitted places, yet it is generally nurtured also in Gardens, and are also many of the following sorts. The next five grow either on Mud or Stone, or Brick Walls, or among Rubbish, as also in Sandy, Gravelly, Barren and Unfitted Places; and oftentimes upon the sides of old Tiled Houces and Pemehouses, but the last grows only in mofty Meadows and Marshes.

XI. The Time. They all flower in the Summer Months, viz. June, July and August, and sometimes in May; and the Leaves of many of them continue green all the Winter.

XII. The Qualities, Specification, Preparations and Virtues of the six last kinds, are in all respects the same with those of Prick-Madam in Chap. 578. from Sect. IX. ad Sect. XVIII. inclusive, to which we refer you.

The Virtues of the Fifth Kind, viz.

Stone-Crop Biting, Or, Wall-Pepper.

XIII. The Qualities. It is hot and dry in the fourth Degree, exalting the Skin, and raising Blizers on it, if applied thereto, and will do it as strongly as Ranunculus or Cresphont. And inwardly taken, it is Emetic.

XIV The
Salmon's Herbal. Lib. I.

XIV. The Specification. It cleanseth the Stomach of groes and tough Plegm, and is said to cure Quarum Aegres, as also Struma, or Scrophula, and the Sciatique, by external application.

XV. The Preparations. You may have therefrom, 1. A Liquid Juice. 2. A Syrup. 3. An Oil by Decotion or Infusion. 4. A Cataplasm of the Herb.

The Virtues.

XVI. The Liquid Juice. Taken to a Spoonful or two, mixed with a night Vinegar, in some proper Vehicle, it provokes Vomiting, and so by exciting thick tough Plegm and other clammy Humors, it conduces to the Cure of old Quarum Aegres, the Kings Evil, and the Sciatique, and other Chronic Difficulties, or such as have been of long continuance. And it is said to expel Poifon, or the force of any Venomous Herbs, as of the Aconit, &c. But Parkinson says, caveat quia simpervis, yet I know no reason for that precaution, provided it be not taken in too great a Dose.

XVII. The Syrup of the Juice, or Green Herb. It is made with Vinegar and Honey, and has all the Virtues of the Liquid Juice. Dose two or three Spoonfuls more, according to Age and Strength, in the Morning fasting.

XVIII. The Oil by Decotion or Infusion. It is good against all cold and moist Difficulties of the Nerves and Joints, as Achs or Pains, Gout, Sciatique, Over-strainings, Palls, Convulsions, Cramps, Strumous Knots or Kernels in the Neck, Throat, and under the Chin or Jaws, or other parts of the Body, and anointed upon the Piles it gives them a pretty ease, and in a short time cures them.

XIX. The Cataplasm. Made of the Green Herb and applied, it draws Blemishes, raiseth Blister and exculcates, and therefore is very profitable being applied to any Wound or extreme Gout or Sciatique: and cures those Difficulties by drawing forth the Muschat Humor. It is made into a Cataplasm by boiling it with Hogs-Lard, adding a little Crumbs of Bread, and applied to Scrophulous swellings, knots and kernels in the Neck, or other parts, it is said to expel, dissolve, or take them away.

CHAP. DCLXXII.

OF STRAWBERRY.

I. H E Names. It has no Greek Name that we know of: but it is called in Latin, Fraga:ia: and in English, Strawberry. The Fruit is called Fraga: (cf. Frulla fragaria odoris & gustus.) Strawberries. Pliny, lib. 33, cap. 9, makes mention of Fretz; and Servius calls them Ara terrestris: yet it is no Species of the Moras, whether you understand it by the Mulberry or Bramble.

II. The Kinds. Authors make many Kinds hereof; but those which are most common with us, are 1. Fragaria Sylvatica vel Nemorensis, Wood-Strawberry. 2. Fragaria vel Fraga Hortensia, Garden-Strawberry. 3. Fragaria vel Fraga Aegres Sylvis, Aloes, Fragma maxima & Bohemic, The great white

Strawberry. 4. Fragaria Viridiss, The Green Strawberry. 5. Fragaria minucola, or muscaria Strump, The Wild, or Batten Strawberry.

The Descriptions.

III. The first, or Wood-Strawberry. The Description of this Plant is the general Exposition of all the Kinds, the material or chief difference being in the Form of the Fruit: In root there is reddish and long, with several small Fibres or Threads at it: which sendeth forth from the head thereof long reddish Strings, running upon the Ground, which grow forth Leaves in many places, by which it is much increased. Its Leaves are close together at first springing forth, which afterwards spread themselves into three divided Parts or Leaves, every one standing upon a small footstalk, green on the upper side, grayish underneath, and fringed or denoted about the edges: from among which, rise up small Stalks, bearing four or five Flowers at the top, consisting of five white round pointed Leaves, something yellowish in the bottom, with some yellow threads therein: After which, come the Fruits, made of several small Grains fitted together, in a Fibrous Substance (not much unlike in Sub stance to a Mulberry, Rosa-strawberry or Brambleberry,) which are very red when they are ripe, and of a pleasant Smyth taste, (as are all the Kinds,) in which are enclosed many small blackish Seeds. The Berries of the second Kind are very red, and the smallest of all the Fruits.

Strawberry Garden Red.
Chap. 672.  English Herbs.

the Soil it is advanced in Goodness, being half or red. If not redder, almost as large again, and also
integrated in its Binny Taste.

V. The third, or great white Strawberry. This
is a very large Strawberry, extremely chiefly, and
of an admirable Taste, and for Beauty farpasses all
others: Pahkistan Figs, that be had from some of
the Berries of which it had been seen five
Indices about: I have seen them of an extraordinary
bigness, admirable to behold. I am apt to believe,
that this is the so much admired Virginia kind,
which I have seen grow to an admirable perfection in

Strawberry White Great.

Strawberry Barren or Wild.

the Gardens in Carolina, exceeding any that ever
was in England. It has been no long Inhabitast
with us, being first brought hither from Bohemia.
As first you must Shill in managing it, it very
rarely bore any fruit, but now, if Planted in a
good Ground, it bears a vast plenty. Formerly
a Gardiner (one Vincent Stew) living by the Back
Side, near the old Paris Garden-Stairs, told me
that from seven Roots, in one Year and a half, from
their increase, he had Planted an Acre and a half of
Ground, before those which he grew away to his
Friends, which bore Strawberries of that Magnitude
or Greatness before mentioned. If you would have
them bear kindly, you must not suffer them to grow
with many Strings, but still cut them away. The
Frust of this differs not from the Garden red, but
in its Magnitude, this being so very much bigger,
and not so globular, but of a more Upright form, and
in its Color, it being much whiter, viz. of a yellow
White on one side, and emulating to redden on
the other, when it is full ripe.

VI. The fourth, or Great Strawberry. It differs
not from the second kind, or Garden Straw-
berry, but in its fruit only, which is green on all

Sides when it is ripe, except on the Sunny side, where
it is a little red, or reddish, and in Magnitude is
much equal to the second or Garden kind.

VII. The fifth, or Wild, or Barren Strawberry.
Its Root is like the former, and in its Leaf much
like the first Wood kind, but differs in its Flower
(if it has any) which is green, bearing rather a
small head of green Leaves, many set thick together
like unto a double Ruff, in the midst of which hinds
the fruit, which when ripe, being it self to be fift,
and something reddish, like unto a Strawberry, but
with many small bareless pricks on them, which
may be eaten and chewed in the Mouth, without any
manner of hurt, and is pleasant like a Strawberry,
but it is truly without any great Super Juice, and
a little Styptick or harsh upon the Taste. It is no great

Beaure, but those it does bear, are set at the tops of
the Stalks chiefly together, pleasant to behold, and
which a Gentlewoman may wear in her Bifom as a
rarity, instead of a Vrime.

VIII. Gerard says, Its Roots and Leaves are like
the others, but somewhat longer, its Leaves sifter,
lightsly indented about the edges, and of a light green
Color. Among which, rise up slender Stems, bear-
ing each Vurmers as the common Strawberry does,
but taller, which rather away, leaving behind a bar-
ren or shabby bait, in shape like a Strawberry, but
of no worth or value.

IX. The Places. The fifth grows in Woods both
in England and America; upon Hills, Vallyes,
Woody and Shadowy places. But the four first
kinds are Inhabitants in our Gardens, all which I
have been grow admirably in Carolina, exceeding
in Beauty, Largeness and Pleasantries, so that I ever
grow it in England. The Barren kind is a Wild
fruit, and has been found growing (as the latter
on Black-beath, Greenwood-Park, &c. but for its fa-
ny has been brought into Gardens.

7 C
Salmon's Herbal. Lib. I.

X. The Leaves. The Leaves are fit to continue Green all the Year: In the Spring they spread farther with their Strings, and Flower in May, the Berries being ripe in June and July. The Barren one Flowers in April and May, but never bears any edible Fruit.

XI. The Roots. The Roots, Leaves and Berries whilf green, are cold and dry in the first Degree, but the Roots more than the Leaves. Allertive, Allrigent, Arbirtick and Valcentny. The ripe Berries are temperate in respect to heat or cold, and moist in the first Degree: Cool the Blood, Liver and Spleen, Confortative and Cordial.

XII. The Specification. The Leaves and ripe Berries flop Fluxes and Catarrhs, cool the heat of Fevers, heal Ulcers in the Mouth, Throat, and Toftills; and stop the Courtes in Women.

XIII. The Preparations. Of the Roots, Leaves, and Green Berries are made, 1. A Liquid Juice. 2. A Decoction in Wine or Water. 3. A Lotion or Garganron. 4. A Distilled Water. 5. An Ophthalmykon. 6. The Ripe Berries. 7. A Syrup of the same. 8. A Distilled Water from the same.

The Virtues.

XIV. The Liquid Juice. Taken to the quantity of 3 or 4 Spoufalos or more, either mixed with the Syrup of the ripe Berries, or with a little Maretan Booth, Morning and Night, it cools the Blood and Liver, allays inflammations of the Reins and Bladder, provokes Urine, takes away the heat, sharpness and itching thereof. It stops Women's Courtes and the Bloody Flux, and softens the Tumours or Swelling of the Spleen. Applied to the Gums it fallens loose Teeth, drops Catarrhs, or Dehiscions of Rheum to the Mouth, Throat, Teeth, and other parts; and is singular good for hot, red, and inflamed Eyes, being dropped into them: As also to repel hot, red, and thorp Humors or Eruptions in the Skin, whether Face, Hands or other parts; and to take away relicts of the Face, Spots or other Deformities of the Skin.

XV. The Decoction of Roots, Leaves, or unripe Fruit in Water and Wine. It has all the former Virtues, being used in the same manner, and may be taken so half a Pint at a time Morning and Night.

XVI. The Lotion or Gargarifon. Take of the Liquid Juice or Decoction a Pint, Henry three or four Ounces: Spirit of Wine two Ounces, wine and distillate. It cleanses and heals foul Ulcers in the Mouth, Throat, Privities or other parts, heals Ulcerated and spungy Gums, and Eftills loofe Teeth.

XVII. The Distilled Water of the same Roots, Leaves and Berries. It is good for hot and inflamed Eyes, relicts of the Face and Skin, and other Deformities of the same, hot Eruptions of the same, Anthoues Fire, &c.

XVIII. The Ophthalmykon. Take of the former Distilled Water a Pint, Henry three Ounces, Spirit of Wine two Ounces, wine and distillate. Drop into the Eyes 3 or 4 times a Day, it is good against an Ophthalmykon, redness, inflammation, and hot Rheums in the Eyes.

XIX. The Ripe Berries. They cool a hot and cholerick Stomach, as also the Blood, Liver and Spleen: quench Thirt, and refresh weak and Fainting Spirits.

XX. The Syrup of the same Berries. It has all the same Virtues, and may be given two or three Ounces at a time upon Occasion.

XXI. The Distilled Water of the ripe Berries. It is a Confitick for the Skin, good against Fevers, and Inflammations of the Eyes, Cimbones Fire, and other like hot Eruptions, Melancholy, Paintings and Paffions of the Heart.

CHAP. DCLXXIII.

Of SUCORRY Garden and Wild.

I. THE Names. It is called in Greek by Tho·ophyllus, Bicbary, &c. &c. also Sycor. (which last Greek Name signifies Endive as well as Sucory: ) In Latine, Cicbory, alfo Cibcoron or Cibores, as Horace has it Lib. 1. Ode 31, My poffident Oliva, Me Cicbore, bruisque nonu. It is also called in Latin Infiborum, but that is the more proper Name (in my Opinion) for Endive: and in English Sucory and Sucory.

II. The Kind. There are 1. Bicbory proper, Cicbory Herfing, Garden Sucory. 2. Cicbory flce Sublebo, Red flowered Cibory or Sucory. 3. Cicbory Sylphfie, fylle or 2. White clad, Cicbory grudge, or cut ericium; Ambigus, Planis Lib. 22. Cap. 8. or rather Anthrobis according to Cefier, and some true Copies; Wild Cibory or Sucory.

The Descriptions.

III. The Fifth, or Garden Sucory. Its Root is tough, long and white, containing many Tots; from which, as also from every part, does fliu forth when cut or broken, a bitter Milky Juice. It is

Sucory Garden, Broad Leaved.
of two sorts, the one with broad Leaves, the other
with narrow Leaves deeply cut or gaffed in on both
sides. The first with broad Leaves is something
like unto Endive, but narrower, among which rise
up Stalks, on which grow the wide Leaves but jun-
furer. The Stalk divides its self towards the top in-
to many Branches, on which do grow small blush
flowers consisting of many small Leaves, after which
follows the Seed, which is of like to Endive-Seed,
that it is very hard to distinguish them ofander by
Sight, but the Curled Endive gives blackish flat
Seed, very like unto black Lettice Seeds, whereas
the Seed of the Garden Succory is white.
IV. The second, or red Flowered Succory. This
is that with the narrow Leaves. Its Root is like
the former, long, white, and abiding many Years.
The Leaves are long, and more divided or gaffed in
on the edges, and yet longer in the tall, high, round

Succory Garden Narrow Leaved.

Stalks. The Flowers are like the former, with this
only difference, that these are of a pale red de-
cayed color, which many times degenerates, and
turns to be blew, being produced from the Seed of
this red Kind. Of this sort, there is one also
which bears white flowers, not differing else, but
the Seed of this white Kind, as well as of the red
Kind, will sometimes give blew flower'd Plants,
and is in form like to the Seed of the broad flower'd
Garden Succory.
V. The third, or Wild Chicory or Succory.
Its Root is white, but more hard and woody than
the former. It has divers long Leaves lying up-
on the Ground, very much cut in or torn on the
edges on both sides, even to the middle rib, ending
in a Point. Sometimes it is found to have a red
Rib or Vein down the middle of the Leaves, from
among which, rises up a hard, round, woody Stalk,
spreading into many Branches, fit with smaller and

Succory Wild.

left divided Leaves on them, up to the tops, where
stand the Flowers, both for form and Color like to
the first Garden Kind, viz. florn, after which comes
like florn'd Seed.
VI. The Places. The first two grow with us
only in Gardens, but the second sort has been
found growing wild in Italy, and that with white
Flowers Wild in Germany. The third is found
growing Wild in many places in England, in walle,
untill'd and barrow-gounds.
VII. The Times. They are all Sown in the
Spring, and quickly come up, flowering in the
Summer Months, and Seeding in Auguft or Har-
volt time, and then dies down; but being Sown
in July, it remains till Winter, at which time
it is taken up by the Roots, and laid in the Sun
or Air for the space of two Hours: after which
time it will be tough, and may be wrapped up in
a heap, and buried in the Earth with the Roots
upwards, so as no Earth can get within it (which
if it should, it would become rotten;) and being
thus covered, it may be taken up again, when
occasion for its use requires it, and so to be used
in Sallets all the Winter, and then is called
wilded Succory. Parkinson says, it is usually
buried a while in Sand, and so grows white, by
which means it becomes both more tender in the
Eating, and also looses some part of its bitter-
ness.
VIII. The Qualities. Succory is temperate in
respect to heat or cold, or rather hot in the be-
ginning of the fifth Degree, and drying in the
same; Aperitive, Afflufive, Diurethic, and a
little Binding; Stonemace, Hepatica, Splantieck
and Nebrineck.
IX. The Specification, Preparations, Virtues,
and Uses, are altogether the same with those of
Endive, in Chap. 244. Sect. IX. of XVIII in which
we refer you. But as Succory is left cold, and
more drying than Endive, so it is more opening.
X. The Decoction of Roots or Leaves, in Wine or Water, drank every Morning, falling to a Pint more or less, expels Hymenoptera and Cholecystic Humors out of the Stomach and Bowels, opens the Obstructions of Liver, Spleen, Gall, Raies and Worms, and is profitable against the yellow Jaundice, heat of the Stomach, diarrhoea and distending of Urine. It prevents also against the Cholera, or evil Disposition of the Body, Dyspepsies, Workfhips by Long Sicknes, and invertebrate or lingering and long continued Agues, Pallidjent Fevers, Painting, Sweating, and other Pains of the Heart.

XI. The Juice or Essence have all the former Virtues, and besides being outwardly applied, are profitable against Rheumatic Fire, Wheals, Pimples, or other Breakings out, Pallidjent Sores, being mixed with Wine Vapours, and so applied. Dose a quart of a Pint, more or less. Morning and Night, either alone, or mixed with any in Vehicle.

XII. The Diluted Water. All the former Virtues are afflicted to it, but in a much meaner and lower Degree. It is good for sore eyes, being used or inflamed, and for Nuts, or Biscuits, which are hard and paired thro' abundance of Milk.

XIII. The Wild Succory, as it is more bitter, so it is more Opening and Abrasive, and also a greater Strengthener of the Stomach, Liver, and other Bowels.

CHAP. DCLXIV.

Of SUCORY Biftard.

I. T H E NAME. It is called in Greek, Κοχυριον, in Latin, Cichoria Notium, and Cichorium Salsadur frutina lateis, Ærvalia Cichorii: and in English, Biflard Succory.

The Descriptions.

III. The fluff, or Rough Yellow, or Biflard Succory. Its Root is hard, rough, and sappy. It has larger and rougher Leaves than those of the former Wild Succory, and its Stalks are five or six inches in Circumference, with smaller Leaves on them, and the seeds jagged, bearing small yellow Flowers like unto an Hawkweed, at the end of every one, which when they are ripe turn into Down with a small long-yet, rough Wild Succory, that is not so dry, and are both carried away with the Wind.

IV. The second, or Smooth Yellow, or Biflard Succory. Its Root is long, pretty thick, taper, round, ferior, and yellow, and full of a bitter Milk. It has long and large Leaves as Smooth Succory, but of a whiter green Color, cut in on the edges, but not so much nor so deep as the former. The Stalks rise not up to the height of the former Succory, and the Leaves on them are left to their own, and towards the top a little or nothing at all. The green Heads which stand at the tops of the Branches, are smaller, and the Flowers which spring on them are larger and more double, something like those of Dandelion, of a yellow Color, which turn into Down, and the Seed therewith are blown away with the Wind.

V. The third, or Smooth Yellow, or Biflard Succory of Naples. Its Root is long and blackish on the outside, and white within, so full of a ferior Milk (without any Bitternæs at all) as is also the stem of the Plant, that it will stand hard like a Gum, if it be not rubbed away, but suffered to abide for some small Time. This in the Form and Disposition of the Leaves, is very like unto the Yellow Succory, and is almost in fea[y]er to the larger been the Succory therewith, sometimes breaking out into Branches towards the top, set with shorter, somewhat broader and more divided Leaves than before, only the Stalks at the bottom, having at their tops green or Yellow Heads or Heads, and small yellow Flowers in long hairy Stalks, like unto the Hawkweeds: which growing greater when they are ripe, contain within them small fine long breased Seed, with a fine white Down on them, both of which are carried away with the Wind.

VI. The Fourth, or our Rough Mountain Succory. Its Root consists of many long Strings, which lends forth several long narrow Leaves next the Ground, very Bradyly densified about the edges, but not divided or cut in at all, and rough also all over. From among which, rises up a Branch brachial forth with half like Leaves set therein, and a large double yellow Flowers at the tops, very like to those of Dandelion, which turn into Down as the rift, and blown away with the Wind.

VII. The Fifth, or Rough and Stiff Succory. It has a pretty long thick Root, which lends forth several round, round, hairy or hoary Stalks, about two or three more or more, having diverse long leaves of the same, with a large number of yellow Flowers on them, deeply gaits in both sides, no much smaller Succory Leaves, parted into many Branches, with lager Leaves therewith than these below, and larger cut in also: at the tops of which Branches, stand many.
Swines Succory.

Chap. 675. English Herbs.

many pale yellow Flowers in green Hanks, much like to Groundsel, which quickly fade in like manner, turning into Down, which with the Seed is carried away with the Wind. This Plant has a strong ill Smell, which is yet more in the hotter times of the Year, from whence come the Egyptians, Bastard.

VIII. The fifth, or Wart Succory. Its Root is small and little, lying every Year after Seed time, and never obiting a Winter, unless it is frozen up from the Seed in Autumn. It springs up, and spreads out several long, and somewhat hairy Leaves near the Ground, cut or divided on the edges into deep Teeth, but not deep Soffets, something resembling Succory Leaves. The Stalks are slender, and divide themselves into some other Branches, with a small long Leaf at every joint, broad below, and encompassing it at bottom. The Flowers grow severally at the Tops and upper joints of the Branches, upon short Footstalks, being small and yellow, composed of many small yellow Leaves, broad pointed, and nicked in, which turn not into Down as the former do, but into small round and flat hard Heads, parted at the Bases into several Branches or Soffets, like unto Warts, with a little Tulip or Crown in the middle; in each Bowl or Wart whereof, is contained a Kernel or Seed.

IX. The seventh, or Swines Succory. It has a small and long Root, from whence spring forth several long and rough Leaves lying on the Ground; Jason at the bottom, and broader towards their

border of the Succories. There is another of this sort, whose Leaves are smooth and narrower, differing but little in any thing else.

X. The Places. The fifth, second and fourth, are many times found in our Meadows and other moist Grounds. The fifth is often found in Sandy Grounds, and by Woods and Hedge sides. The third Column is found growing on Hills in the Kingdom of Aquas, and the sixth is said to grow in the island Ypsam, from which places they have been brought to us, and are curst up in our Fields. The seventh grows abroad in the Fields, and in wafte Grounds and Lands in divers places of England.

XI. The Times. They all Flower and Seed about the same time with the other Succories; except the second, which Flowers earlier than all the rest.

XII. The Qualities. Specification, Preparations and Virtues of these, are the same with those of our Common Succory, to which you are referred. This is also to be noted, that in Aquas and other parts of Italy, the Neapolitan kind is what is termed the True Succory, it being very like to it in its form.

XII. The Wart Succory. Authors say it is very good for the Curing or taking away of Warts. And this they think it does, by curing the Herbs as a Sallet, or by taking at Bedtime a Dram of the Seed in Poudre in White Wine, for certain Days together, to also the Powder of the Leaves given to a Dram in the same manner. But I think there is not much in all this; if there be any Virtue of this Kind in this Plant, it will be felt manifested, and moily exists its power in that kind, by an external Application to the parts affected, after this manner. Take the expressed Juice of the Plant, and heat it almost boiling hot, with which both the Warts; or 4 or 5 times a day or oftener, letting it dry in after every time of Bathing; and continue this so long till the Warts are awatned away. This takes away, will certainly extinguish them, as he and divers others had found by Experience. The said Juice being taken in Wine, is said to be helpful also against the bitings of mad Dogs.

CHAP. DCLXXV.

Of SUCCHORY Gen.

I. TH. Names. It is called in Asbach, Condorche, Cadorch, and Arnior: in Greek, Xonchoro; in Latin, Chondrilla: and in English, Gum Succory.

II. The Kind. Authors make thirteen or fourteen sorts thereof, most of which are termed Strangers to us. We shall only treat of such as are sometimes North up in our Gardens, which are the four following: 1. Chondrilla pura, legitima, Phinoforis secundum Cufum, Chondrilla Gras, Turumanteste; Chondrilla solis, Cadorchius tenen- tis, The true Gum Succory of Phinoforides; some say, Phinoforides called it Cadorchus, and some Seris; and for that the Leaves were like unto Succory, they accounted it a Kind of Wild Succory. 2. Chondrilla biura, five purpuræ, Taberna- monte; Chondrilla Gerakal, Pulverum Lahanyst, Chondrilla altera, Dudum, Chondrilla prina, Cadorchus familiae Curts, and Chondrilla tenente; Chon- drilla...
Salmon's Herbal. Lib. I.

Succory Gum True of Dioscoreides.

The Descriptions.

III. The third, or true Gum Succory of Dioscoreides. Its Root grows deep down into the Ground, and spreads into many thick Branches like Dandelion, blackish on the outside, and yielding much Milk in every part when broken or cut, which are so apt to grow, that every little piece in the Ground will spring again, and bear Leaves. It flows forth in the beginning of the Spring, several long, divided, or rather Jagged Leaves; consisting of many long and narrow Jags, cut in on both sides to the middle Rib, and equally set almost one against another, of a bluish green color, very tender, and full of Milk when broken or cut; from among which, rise up weak and tender Stalks 3 or 4 Feet high, scarce able to stand upright, very brittle also, and apt to be broken, and as saith Milk on the Leaves, which divides it self towards the tops into a few other smaller Branches, with smaller and less jagged Leaves upon them; at the top of which great small bluish Purple flowers, and sometimes white, consisting of ten or twelve small narrow Leaves, standing round about the middle, which when they are ripe, fall away of themselves.

V. The third, or Broad Leaved Purple Gum Succory. This Gum Succory is very like the former in every respect, differing in this, the Leaves are something broader and shorter, and the Galles are also larger, in which particulars, the chief difference consist.

VI. The fourth, or Strange Gum Succory. The Root is small and long, yielding a milky Juice. It has many long and narrow rough Leaves, pointed at the ends, and jagged in two or three Places on the edges, sometimes more or less, lying on the Ground, resembling very much the Leaves of Coromopsis, or Buckhorn Plantain, but with fewer, greater, and longer cuts or Jags. The branched Stalks are set from their middle, with such lovely Flowers.
false like Lentus, but narrower, some without any jugs, and some with but one or two jugs, bearing at every one of their tops, upon slender bare long Stalks, a small whitish Sicory like fally Head, out of which break forth four double blowers, containing many Pancrathious little leaves, directed or cut in at the broad ends, with some yellow thread-like hairs in the middle, after which comes small Seed, like unto Fedora being compared, (where whence the Name Fedora but more like to a Cymus or blue Bottle, or Corn Flower, but browner. Bauhines makes two sorts (as foresaid) of this Plant, which vary not much one from another, their difference being very probable in arise from the differing Soils in which they are found growing, the like of which has been found in many other Herbs, which yet have been but one and the same Species.

VII. The Places. The first grows wild in several places in Spain, the other grows wild also in waife Grounds by Ditch sides and by Path-ways, in Fields and Palluts in several parts of Italy; but with us they are only Nurtur'd (by the Curious) in Gardens.

VIII. The Times. They all flower in the summer Months, and yield their Seed in a short time after; but are so tender, that they soon perish with our Winters Cold.

IX. The Qualities, Specification, Preparations and Uses. They bear a close Resemblance to three of our Common succors. The first of these is of the same property with Wild Sorgory, but more bitter, and more drying, and is thereby more effectual in drying Obstructions; and by its drying and affringent Qualities, it hobs the Loose-ness of the Bowels, the Juice of the Root being taken in Wine. The Juice of the Root or Herb, drank is good against the biting of Vipers, and all other Venenumous Serpents; it strengthens the Stomach, and helps Digestion. It is said, the Juice of the Root drops from the point of a Spear, or笋 as such small thing, upon the Roots of the Hair on the Eye-brows, Forehead, &c. takes them away, and hinderers their growing again; but of this I know nothing by Experience. The same Juice with some Nitre dissolved in it, being Ba-thered upon the Skin, is said to take away Freckles, Lentils, Tanning, Sun-burning, and other diff-colorings thereof; as also Scari, Morphones, Spots, Pimples, &c. infographic up the Womb, it also draws down the Coursils.

X. The second and third are als of the same Virtues with our Common Garden Succory, and in Italy they are said to be eaten in their Sallets, as we do our Succory here. We have no Author who gives any especial Instince of their Virtues, but only they are referred to the Kindred of the Succories.

CHAP. DCLXXVI.

OF SUN-DREW.

OR, ROS SOLIS.

I. THE Names, It has no Greek Name that we know of, but it is called in Latin, Ros Solis, Rosella, and Rowida by Luther, and by some Salforas; and in English, Sun-Drew, and also cor-ruptly, Rofa Solis.

II. The Kinds. Authors make two or three sorts hereof; 1. Ros Solis, Rosella rotundifolius major 12 mina, Round-Leaved Sun-Dew, which they will have to be both greater and taller. 2. Ros Solis Synopifer longifolius, Long-Leaved Sun-Dew.

The Descriptions.

III. The fifth, or round Leaved Sun-Dew. Its Roots consists only of a few small Hairs, Fibres or Threads, which sends up three or four round fol-low Leaves, something greenish, has full of se-veral red Hairs, which make them seem to look red, every Leaf standing upon its own Porrfath, reddish hairy likewise, the Leaves have this won-derful property, that they are continually with in, or full of Dew in the hottest day, yea, the better the Sun shines upon them the more airy they are, and even at Noon time the Hairs will be full of drops of Dew, more especially if the Sun shines brightly and clearly out, which is with a certain Stimu-lation which will rise, or draw out as it were into Threads, the small Hairs always holding this Misflure. From among these Leaves springs up (about a Month after them) small tender Stalks about a Fitches high, which are reddish also, bearing several white books, one above another, which are the Flowers, of a whitish color, after which the heads are contained certain small Seed. Some authors make a greater and lessor of this Species, which is the only difference or variety.

Sun-Dew round Leav'd, and long Leav'd.

IV. The second, or Long-Leaved Sun-Dew. This in its Roots, Stalks, Flowers, Seed, Dews, and Formalities of growing, differs not from the former, but only in its Leaf, which is much larger and also long withall.

V. The Places. They usually grow in Boggs and wet Places, and Sometimes in most Ladys plants, as also in Delfant, and Sunny Places, but yet wary withall; and seldom any where else than amongst white Moonfirth Moss, which grows on the Ground, as also on Boggs. The second has been found growing near Dublin in Ireland; it also
also grown by Eltisferne in Sherifford, by the ways sides thereabouts.

VI. The Times. They are said to flower in June, at which time the Leaves are in best condition to be gathered. Gerard says they Flourish in Summer, and Flower in May and June, and are to be gathered when the Weather is Calm, Dry, and Serene.

VII. The Quantity. They are hot and dry in the first degree, Aperitif, Astringent, Pectoral, Cordial, and Deodorative.

VIII. The Specification. It is profitable against Catarrhs, and Salt Rheums falling upon the Lungs, Coughs, throat of Breath, difficulty of Breathing, Asthma, and is said to cure Phthisicks or Consumptions of the Lungs: It is Cordial, good against Sickness at Stomach, Paintings, Swoonings, Palpitation of the Heart, &c.

The Virtues.

X. The Simple Distill'd Water. Both Gerard and Parkinson tell you that if it be made with a Glass of Alumbrick or Still, the Water will be of a Golden Colour. It is sharp, quick, drying, and binding, good for such as are troubled with Catarrhs, Rheums, Coughs, Colds, Asthma, Consumptions, and all other Difficulties of the Lungs, and heals Ulcers of the Lungs, comforts the Heart, and is good against Healing of the Spirits. Doe it or 3 Ounces either alone or mixt with a little Gentle Wine.

XI. The Compound Distill'd Water. Take Ros Solis a Pound, Bown, Lomon Peel, Orange Peels, and, a quarter of a Pound, Winters Cinnamon in grafts Powder, two Ounces, White Lisbon Wine a Quart, Milk Water a Pint, mix, digast a Week, then draw off the Water in a Glass Almbrick in Balano to drink. It has all the former Virtues, but much more Cordial, and more prevalent against Painting and Swoonings, Fits, Quaam, Convulsions, Palpitations, Lungs, Mumps, and the like Difficulties.

XII. The more Simple Tincture. Take Ros Solis 4 Grafts gathered a Pound, Bown, Garden Scanty Grass, Garden Cress, of each a quarter of a Pound; Angelica Seeds in graft Powder, of each 2 Ounces; Saffron, Cinammon, the loft in fine Powder, of each 3 Drams; Spirit of Wine 3 Quarts; mix, digast a Month in a gently Sand bottle, letting the Glass once every day, then let it all perfectly settle, decant the clear Tincture, and keep it in a Glass clofe stop for use. It has all the Virtues of either, the former, and a most potent thing against the Scoury in a cold Habit of Body. Doe it from one Dram to two Drams, in a Glass of Wine, or some other proper Vehicle, Morning, Noon and Night.

XIII. The more Compound Tincture, commonly called Roff Sols. Take Ros Solis twelve handfulls, red Rose Leaves two handfulls, Liquorice bruised or scraped 4 Ounces, Cinnamon, Red Sanders, of each 2 Ounces, Angelica, Coriander seed, Natures, of each 2 Ounces, Cloves, Galanga, Ginger, of each an Ounce, Cumbus Aromaticus, Cardamon, Grains of Paradise, Zedbar, of each a quarter of an Ounce; Spirit of Wine or choice Brandy 5 Gallons, mix, make an infusion for eight days, then being perfectly settled and fine, decant the clear Tincture into another Glass, and add thereto to of double or triple reduced Sugar three Pounds, mix, digest, and keep it for use. It is a Noble Tincture, and has all the Virtues of the former Preparations, and being of a drying, binding and strengthening quality, is appropriated to the Lungs; and therefore of excellent use against all Difficulties of that Bowel; as also of the Heart, Midrift, Mefenterie, Intermittes and Worm. Doe it a Spoonful or less, Morning and Night, in a Glass of Wine, or other fit Liquor, with which it may be mixed.

XIV. The Cataplasm. It is made of the whole Plant beaten to a Pulp, adding also a little Salt. Being applied to the Skin, it is said to exudate and raise Blisters.

CHAP. DCLXXVII.

OF SUN-FLOWER of Peru.

I. THE Name. It has no Greek name, yet Authors call it Quinquenius Peruvianus, Chrysanthemum Peruvianum, Flos Solis, Flos Maximus, Sol Scandinavus, in English, Sun-Flower, Golden Flower of Peru, and Marigold of Peru.

II. The Kinds. Authors give us the knowledge of two principal Kinds hereof, viz. 1. Chrysanthemum Peruvianum major, Flos Solf major, The greater Sun-Flower. 2. Chrysanthemum de Peru minor, Flos Solf minor, The Lesser Sun-Flower, or Marigold of Peru.

The Descriptions.

III. The first, or Greater Sun-Flower, or Golden Flower of Peru. In Ross is white, compact of many Strings, and strongly founded in the Ground by some greater Roots branching out, and a number of small stirlings, which grow not deep, but keep under the upper Craft of the Earth, desiring much moisture, which dye every year at the first approach of Winter, and therefore must be new Sown every Year in the beginning of the Spring. It rises up from the Seed, at first like unto a Popinsum with two Leaves, and after two or four more Leaves are come forth, it rises up into a great Stalk, bearing the Leaves at a due distance on all sides thereof, one above another up to the very top, being some times, and in some places, 7 or 10 feet high, which Leaves having past from the Stem or Stalk, upon their several great ribbed Petalshalls, are very large, broad below, and pointed at the end, round, hard, rough, of a salt green Colour, and bending downwards. At the top of the Stalk grows one great, large, thick, and broad Flower, bowing down the head unto the Sun, and breaking forth from a great head, made of many green Leaves, like unto a great angel, with many long yellow Leaves, set about a round yellow throstle, as it were in the middle, which are very like the nose short brads of Flowers, under every one thereof, there is a Seed, larger than the Thistle Seed, yet somewhat like, also lower and rounder than any Gunard Seed, which are set in
Sun-Flower Greater.

Sun-Flower Lesser.

Times blackish or greenish. The whole Plant, and every part thereof, has a strong refulous Scent, much like to that of Turpentine; and the Heads and middle parts of the Flowers do oftentimes, and sometimes the joints of the Stalks where the Leaves stand, fooot out a most thin, fine, and clear Raffin or Turpentine, but in small quantity, as it were in drops, in the hot and dry time of the Year, fo like both in Colour, Smell and Taste, unto clear Venice Turpentine, or Strasburgh Turpentine, that it cannot be known from it.

IV. The second, or Lesser Sun-Flower, or Marigold of Peru. This in its Roots, Stalks, Leaves, Flowers, Seed, Turpentine, and manner of its growing, is like the former; but it is altogether lower, the Leaves more jagged, and very few in number. It is either without Branches, or with many Branches, with a black, or with a white Seed, the form of the Leaves and Flowers differing but only in the greatness or smallness, as has been just now said. Gerard seems to make this to be twofold, viz. 1. The Male. 2. The Female.

I. The Male kind be fays peripher in its Root, as far as it has peripher in Seed, being thick, hard, and of a woody foldance, with many threads fibrous annexed thereto. From which rises up a gray or rufic Stalk five or six Cubits high, and sometimes as thick as ones Arm. (I fuppofe this is in its Native Country of Peru, for cuth as in England, it attains

Leaves. The thremmed middle part is blacker than that of the fift or greater before Described: And the whole flower is compofed about likefife with divers fuch Rufet Leaves, as they which grow lower upon the Stalks, but lower and narrower. The Plant and every part thereof smells of Turpentine, and the Flower yields fmall clear Turpentine. The Seed is long and black, with certain Lines or Streets of white running along the same. II. The Female kind has also a thick and woody Root, from which rifes up a Strati Stem, dividing it Self into one or more Branches, for with fome Leaves, fharp pointed, and slightly indented about the edge. The Flowers grow at the tops of the Branches, of a faint yellow color, the middle part being of a deeper yellow, tending to black, of the form and fhape of a fingle Marigold, the Magnitude excepted. This Plant fays another Author, fows out into many Stems, and a great many Branches, requiring very much room, fo that it is apt to choke other Flowers which grow near it. For whereas in Peru it is arrived to a reasonable height, and before it is full green, it is to be eafily with a Garden pair of Scissors, to refrench the Branches whichspread too much, and fuch as fow out too high.

V. Of the full or Greater Sun-Flower at Sot. III above, Gerard gives us another Kind of De-
scription, which because it is something remarkable, we will also give you here. Its Root (he fays)
Salmon's Herbal. Lib. I.

I. THE Names. It is called in Greek, Πυρικινα; in Latine Helianthemum, Vos Solid, Chamaenélus, Gillus Pumilus, Gillus repens; Vos Solidi, in English Sun-flower creeping, and Dwarf Gillus.

II. The Kind. Authors give us about half a Score sorts of this Plant, we shall trouble you only with the five following, viz. 1. Helianthemum vulgar, Helianthemum Anglica latum; Our English yellow creeping, or Dwarf Sun-flower, 2. Helianthemum vulgar ver Anglica album, 3. Helianthemum sur inplace flor late; Chamaenélus secundus Clary Gillus Humile; sur inplace Flor late, Creeping Sun-flower with Time-like Leaves, 4. Helianthemum Lattam Germanica, Yellow Creeping, or Dwarf Sun-flower of Germany. 5. Helianthemum album Germanica, White Dwarf Sun-flower of Germany. Chamaenélus says he should rather refer these Plants to the Family of the Female Gillus, calling them Chamaenélus, because says he, they are like unto them both in Face or Form, and Property. Some take this Creeping Sun-flower to be the Helianthea Plur, which Cordus calls Helianthemum, or Vos Solidi, and do Lobl, Tubermonstrosus, Thallos, and divers others.

The Descriptions.

III. The fifth, or our English Yellow Creeping Sun-flower. It has a hard and woody Root, growing in time to be something great, but not very long, and divided into small branches at its lower end, from this rise of several small and weak, yet hard and almost woody branches, lying for the most part round about the head of the Root upon the Ground, on which are set by couples, many small and somewhat long Leaves, a little flat or bony, with other small Leaves also growing between them; at the tops of which grow three or four small pale yellow, and sometimes Gold coloured yellow Flowers, consisting each of five round pointed Leaves, with some yellow threads in the middle, having in some Places or Soils, a pretty pleasing Smell, but few or more in some other Places; after which yellow small round Heads, containing small yellow Seed. This
Sun-Flower Creeping English, Yellow and White.

of a brown colour, on which grow little Leaves set by Couples, thick, fat, and full of Juice, covered over with a soft down, from whose bosoms come forth other leafy Leaves. These Leaves are a little whiter and longer, and not set so thick together as the former, but are more Woolly. The Flower is also something larger, and of a white Color, in which consists the chief Difference. In some Places or Grounds, it is a little Swarter, but in some other Soil little or nothing at all; and its Juice is of an Altringent and Austere Taste like the other.

V. the third, or Creeping Sun-Flower with Time-like Leaves. Its Root is very fibrous, and spreadeth much under Ground, and the Plant creeps upon the Ground, much like unto Wild Thyme, with small leaves, set upon reddish Bracts very thick, or as it were in a double row, of a dark green Colour, and a little hairy estbal, which are a little longer and whiter next to, or near the Flowers, which grow three or four together,

which grow Leaves fester than those of Lodon or Cittus, and very like to our English White Creeping, or Dwarf Sun-Flower, at Seif. IV. whose of a tall or mucilaginous Flori Substantia, and thicly haired, the Flowers are like unto little Lepes, or the Wild Tafie Flower of a yellow Color.

VII. The fifth, or White Dwarf, or Creeping Sun-Flower of Germany. This in its Roots, Branches, Leaves, Flowers, and manner of growing, is so like the last Described, that they are not to be distinguished from all the time of flowering, the Flowers in this being White, whereas in the former they are Yellow, this being the chief, or only Difference.

VIII. The Places. The fifth and second grow in several places of England, but especially in Kent, in almost every Track thereof throughout, which in some places is greater than in some others, yet that with the white Flowers is not altogether so common as those with the yellow. Gerard says he has found them in many places in Kent, upon the Chalky Banks about Gravesend and Southfleet, and for the most part all the way from thence to Canterbury and Dover. The fourth and fifth differ not much from our English, and I am told, have been found in several parts of this Kingdom; and by reason they do little differ from our English

Spicer,
Species, some have thought them to be the same, their difference arising chiefly from the Soil. The third grows in rough, dry, and Sunny places in plain Fields, and upon Mountains. Clafius Keys be found it upon the highest Alps or Mountains of Angria and Sitiia, and as some think, is the first here described, which is the most useful for growing in England.

IX. The Times. They all Flower in the Summer Moods, from the beginning of July to the end of August, but the Flowers soon fade, seldom enduring a growe day or two, preferring their Seed in some small time after.

X. The Qualities. They are hot and dry in the first Degree, Attractive, Alkrfingent, Vulnerary and Antiputrid.

XI. The Specification. They flop Fluxes of all parts, Carcinous, or Distentions of Rheum, all Bleedings whether inward or outward, Spitting or Pilling of Blood, Bloody-Flux, the Overflowing of the Terms and Whites, Caraths, or Distentions of Rheum, and all other Fluxes of the Bowels whatsoever. Mix it with Wine, they are profitable to waff, cleanse and heal Sore and Ulcerated Mouths, Votes, as also Ulcers in the private Parts of Man or Woman, or in the Legs, Thighs, or in any other part of the Body. Green Wounds being waffs with them, it stops the Blood, dissolves them to a speedy healing, and consecutes their Lips, Contolling, Binding and Strengthening the part, or any other place weakned by any Accident. And Clothes dippd into them, and applied to Wounds made by the Stinging or Biting of any Poisonous Creature, it hinders the Poison from spreading, and draws it forth, more especially if they be taken inwardly at the first time.

XII. The Preparation. You may have then, from: 1. A Liquid Juice or Essence. 2. A Decoction in Wine. 3. A Balsam or Ointment. 4. A Cataplasm. 5. A Diluted Water.

The Virtues.

XIII. The Liquid Juice or Essence. Taken from two Spoonfuls to three or more, in any proper Vehicle, as Barbat Wine, or any other Syrupick red Wine, they stop all Bleedings whether inward or outward, Spitting or Pilling of Blood, Bloody-Flux, the Overflowing of the Terms and Whites, Caraths, or Distentions of Rheum, and all other Fluxes of the Bowels whatsoever. Mix it with Wine, they are profitable to waff, cleanse and heal Sore and Ulcerated Mouths, Votes, as also Ulcers in the private Parts of Man or Woman, or in the Legs, Thighs, or in any other part of the Body. Green Wounds being waffs with them, it stops the Blood, dissolves them to a speedy healing, and consecutes their Lips, Contolling, Binding and Strengthening the part, or any other place weakned by any Accident. And Clothes dippd into them, and applied to Wounds made by the Stinging or Biting of any Poisonous Creature, it hinders the Poison from spreading, and draws it forth, more especially if they be taken inwardly at the first time.

XIV. The Decoction in Wine. It has all the former Virtues, and may well be used to all the same Intentions, but as it is weaker, so it is to be given in a larger Dose, as to 4, 6, or 8 Ounces. This as well as the Juice and Essence, being taken inwardly for some considerable time, is said to be profaible in Curing Ruptures of the Bowels.

XV. The Balsam or Ointment. It is Vulnerary, cleanses and heals Ulcers, Contollates Wounds, and quickly heals them; strengthening all the parts it is applied to.

XVI. The Cataplasm. Applied to the Biting or Stinging of any Venomous Creature, it draws out the Poison, and applied to the Goats, or any weakned Limb or Joint, it eases the pain, and strengthens the part afflicted.

XVII. The Diffusè Water. It softens and whitens the Skin, and Beautifies the Face and other parts to which it is applied, being used several times a day.
VI. The Places. The thistle grows in many places of England, as well as in Brabant and Flanders, and other places beyond Sea, and therefore Label might as well have called it Anglica as Brochonaci, for it being truly a Native of our Country, tho' possibly he might not know so much. It grows in Harfordshire, Kent, Suffren, Coblestone, and near Old Windsor. It is also found in several Martyr, Phipps, Mollit and Fenny Grounds, as in Bedfordshire, Cambridgeshire, and the Fennsy Countries thereof, which there are none, that it makes Figges, Beethes or Sheaves thereof, to be grown and heir their Ovens, and kindle Fires withal, as they do of Sedge. It is also found growing in most places where Sedge grows; for which reason it is commonly found bound up promiscuously in Sedge Sheaves, which Bakers use to heat their Ovens with at Lyne in Norfolk, and other great Towns and Market-Places where it can be conveniently carried by Water, &c. This The Harebell in several Countries in the Levant and Mediterranean Sea, as the South parts of France, Italy, Sicily, &c. but with us it is only customarily in Gardens. This is that of Plays, Lib. 3. cap. 1.

VII. The Times. They Flower in May and June, and their Seed is ripe in July and August.

VIII. The Qualities. They are hot and dry in the second degree, Apathetic, Apathetic, Affure and Stephick, diffusing Wind, Cephalick, Neurasthenic, and as some think Narcotic.

IX. The Speciation. The first kind is only of chiefly used: It is good to dry up Humors in the Belly and Stomach, to kill Worms in those parts, to strengthen the Brain and Nerves, and to induce Sleep.

X. The Preparations. The first of the two Species being only in use, the Preparations will chiefly have reference to that, and there is a peculiar use of it in 1. Ale or Beer, which in some places are Brewed with it, as with Hops. 2. A Decotion in Water or Wine. 3. An Infusion in Wine. 4. A Tincture of Leaves and Barks in Spirit of Wine. 5. A Pouder of the Leaves or Seed.

The Virtues.

XI. The Ale or Beer. It preserves the Drink from fame, or growing lower like Hops, and makes it Drink very strong, and by reason of its pleasing Bitterness, gives it a pleasant Taste or Farwell. As it makes the Drink to be stronger, so it also makes it more nourishing, and makes People Drink, but it only affections the Brain by its Strength, not by any ill Quality which is in it, for some Authors seem to think, it being a true strengthener of the Stomach and Nerves. And to far is it an Antifeptic, as all Stomachicks are, the Scoury being called by the Greeks the Stomach Difficule, and for which they have no other name.

XII. The Tincture in Water or Wine. It warms, comforts and strengthens cold, moist and weak Heads, Brains, Nerves and Stomachs, refills the Scoury in its beginning, and cures it when Comtaminated, a quaker of a Pint or more, being taken in the Morning fasting, half an Hour before Dinner, and half at Night going to Bed. It is also regular good also against Palies, Convulsion, Goats, Jaundice, Collick, and other Diffeces of the Brain, Nerves and Viscera. It kills Worms in the Bowels, refills Polution, and causes pleasant Reft and Sleep, not much unlike to the manner of Opaties, informs that some have been long constant in taking it, have with some difficulty left it off.

XIII. The Infusion in Wine. It has all the Virtues of the former Decotion, and may be taken in the same Dose and manner, but as it is only a cold Infusion, so it is much more grateful to the Stomach and Bowels, refilling Polution, and strengthening them after an admirable manner.

XIV. The Tincture of the Leaves and Fruit, or Seed. This is much better in a cold Scoury, than either of the former, and more potent against Cramps, Convulsions, Palies, and other cold and moist Diffeces of the Head, Brain, Nerves, Joints and Viscera. It also prevails against Polution, vement pains in the Bowels, or any exteam part of the Body, Coughs, Colds, Affhmas, Phthisick, Headnecks, Wheezing and hoarsness of Breath; stops Vomiting, and gives relief in extreme Heart-Sickness, Palpitations, Fainting, Swooning and the like: Dose 2, 3, or 4 Spoonfuls in a small Glass of Wine.

XV. The Pouder of the Leaves or Seed. It is given from half a Grain to a Dram, for all the purposes aforementioned, being an excellent Stomachick; but its chief use is for killing Worms in Children, as also in Elder Persons.

XVI. Note 1. In those places where it plentifully grows, as also in other places to which it is carried, the Country People lay it in Wardrobes, Cloths, Trunks, Pouches, and the like, to keep Woolen Cloths from Moths, Worms, &c. and to give a good scent and pleasant Smell.

XVII. Note 2. The Rhine Pteryx, Acacia, or second Species, tho' we make little or no use of it, (because we have it so great plenty) yet Pliny says it kills Moths, and refills Polution.

CHAP. DCLXXX.

Of SWALLOW-WORT: or,

SILK-WORT.

I. THE Names. It is called in Greek, Ana.-

wic (ab Afeleptico) also Knobi qausi Hede- rula, and Kamelion, Hederoforum, and to Rad- boo called Hederula: and yet the Leaft is not at all like bay, but are rather like unto Bay Leaves, faying that these are sharper pointed. In Latin Afeleptris alias, and Vincentiuncum, (which is a general Word for any Country Poison, or Vincenti- cum quas Atepsinicum dittum, &c. and illi infetive adversus in venenas vitus infct.) It was also antlely called Horiumania, (as were also Chelba- tiaq molia & minus) because the pointed Cods when they are open, and the Silk appears out of them, do somewhat resembhe a Swallow Fying. In English, Swallow-Wort, Silk-Wort, and by some, Silken Clofle.

II. The Kinds. It is doubtles the true Afelepti- a of Desforde, tho' Anglialo doubts of it, and Matthebns denies it, yet Dodson and Plurlhis confirm it, and thus it is the true Vintenciuncum. We have with us 1. Afeleptias five Vintenciuncum Fove also, Swallow-Wort white Flowerd. 2. Afeleptias five Vintenciuncum Fove hage, Swallow- Wort black Flowerd. 3. Afeleptias Cretica, Swallow-Wort white Flowerd.
Swallow-Wort White.

gradually growing left and left to the Point, in which the small first brown Seed, wrapped up in a great deal of white Silk Down, which when the Seed is ripe, opens of it self, and sheds both Seed and Silk upon the Ground, if it be not before hand carefully gathered. This Plant yields no Milk of any sort, White or Yellow in our Country, as the Apocynum or Dogs-Bane does, but only a thin watery Juice. Both Leaves and Stalks dye away and purify every Year, and rise again the next Year in the Spring, the Stalks bring in their first springing up of a blackish brown Color.

IV. Gerard describes this flint sort after this manner. Its Root consists of very many white Thready-Strings, and of a strong Smell. It has diverse upright Branches of a brownish Color, of about 3 Feet high, heaves with Leaves not much unlike to those of Amara Dulcis, Dulcamara, or Woody Nightshade, somewhat long, broad, sharp pointed, of a blackish green Color, and strong Smell. Among which, some forth very many small white Flowers, Star Fashion, hanging upon little slender Boughs, after which come in their places, long, sharp pointed Cols, filled full of a moft perfect white Cotton, resembling Silk, as well in these as handling, from which some call it Silken Cotton, in which it wrapped up fets brown Folks.

V. The Second, or Swallow-Wort Black Flower'd. Its Root is a small Bath of white Strings, not much unlike the former. It grows in the June

Swallow-Wort Black.

manner which the other does, having its long fnder
rough Branches, stretching out to a greater heighth or length than the former, and growing themselves about whatsoever friends next meet them, and bearing on them such like dark green Leaves bearing by
ouples, but something smaller than they. The
Viners grow likewise in the same fashion, but
somewhat fmalier also, and ofJo dark a purplish
Color, that they seem to be almost black, and are
fearely
Chap. 680. English Herbs.

The Virtues.

XII. The Decoction of the Roots in Wine. It is peculiar Cure against the Poison of Apocynum, or Doga-Bane, or Woflifi-Bane, or any other Vegetable Poison; as also against the Bitings of Mad Dogs, or the Biting or Stinging of any other Venomous Creatures. It gives ease in the Collick, and the Gripping of the Lungs. It prevails against the Plague or Petteulence, Spotted Fever, Purple, Calenture, Measles, Small Pox, and all other sorts of Maliges, and Pestential Distempers. The Decoction made strong in White Wine, and taken for several days together, a Pint at a time, and swarming presently upon it, cures the Dropdy, also the yellow Jaundice, and Rupppate of Urine thro' iniferious matter in the Kets, Urines and Bladder. It helps also Coughs, Colds, Asthma's, Phthisicks, Heartlind, Wheezing, and other Distemps of the Breast and Lungs. It is also profitable against Vapors, Hysteric Fits, and provokes the Terms in Women. If it is made also with the addition of Confrey Roots, it is good against Ruptures of the Bowels, inward Bruises, Bleeding, and the like.

XIII. The Pouder of the Roots. It has all the former Virtues, much excelling the Decoction, and may be given to a Dram or Dram and half in Car-

ny or White Lisbon. Morning and Night. It is good against Paining, Swelling, and all Patheses of the Heart: Taken with Powey-Seed it helps a-

gainst the Falling Sickness; with Pouder of White Dittony Roots, it kills Worms in the Belly, and prevails against Metaholgy.

XIV. The Ointment or Balsam. The Pouder two

Drams, mixed with fix Drams of any Vulariny Ointment, or Balsam of Tobacco, &c. Cleanese, in-
carnates and heals Wounds, and old Purulid and Rotten Ulcers, beyond that of Birtsment-Ro's, or of any other Vegetable whatsoever.

XV. The Tincture. It has all the Virtues of Decoction and Pouder, excelling them ten times in Virtue and Goodness. Dope a Spoonful.

XVI. The Consipiose of Leaves and Flowers. It cures R tienensores in Women's Breasts, as also running Sores and foul Ulcers in the same parts.

XVII. Dry Pledgets of the Silt or Done. Ap-

plied to old running Sores and Ulcers after cleaning, it dries them, and in a short time after heals them.

CHAP. DCLXXII.

OF TANSIE Garden.

THE Name. It is called in Greek, "Merahe; in Latin, Tanacetum, Athanasia, in Eng-
lisht, Tansie.

II. The Kinds. Authors make many kinds of this Plant, but these four are those which are chiefly known to us, viz. 1. Athanasia Valeriana, Tanacetum Valsere, Our Common Garden Tansie. 2. Athanasia Gratiss, Tanacetum Sativa Anglica. 3. Tanacetum Crisifolium, Crisped, or Curled Tansie. 3. Tanacetum Verticulata, Tansie Party Coloured. 4. Tanacetum Longifolium, Woolly Tansie.
Flowers grow upon the tops of the Stalks, in certain cluded Tansies (without any Leaves as a Pate about them,) which flowers are of one round Bnt-

Tansee-Garden, Common.

IV. The second, or our Crisped, or Curled Tansie. Its Root creeps under Ground, and shoots up again in divers places. Its Leaves are winged side the former, which are hard and green, being many small ones set by pairs one again of another upon a middle Rib, joint about the edges, but closer and thicker, for than the first, and much crumpled, which has caused it to be called double or Curled Tansie. It rises up with several hard Stalks, on which, and on its Branches at its tops, grow Gold yellow, orange, or crimson Flowers almost like Buttons, which being gathered in their Prises, and held the first Color for a long Season. The Seed is small, and as it were Crispie, and the whole Herb, both Leaves and Flowers, both a piercing strong, but a very pleasant grateful Smell, and a sharp smirr-bitter Taste, exactly like to the first Common Kind; so that by the Smell and Taste only, they are not to be distinguished one from another.

V. The third, or Tansee Party-Coloured. This in its Root, Leaves, Stalks, Branches, Flowers, and form, and manner of Growing, is not to be distinguished from our common Garden Tansee. The only difference between them is this, That upon the first rising up the Heads of Leaves, they are almoft all White, and after they are grown great, there will be many Leaves remaining White among the Green, which makes it the more pleasant to behold, seeming like a Party-Coloured Feather, in refemblance to the fine cut Leaves of White and Green.

VI. The fourth, or Woolly Tansie. It has a Root which is thick, fellow, fibrous and spreading, which sends forth divers mingled Leaves, something like unto the former Tansie, and nearly like to Yarrow Leaves; of which some would make it a Species, but that the Smell convinces us to the contrary, this being very strong and Sweet like, whereas Yarrow has no Smell at all. The Leaves are also very Woolly, set close together about the Roots, from among which growing up several Woolly Stalks, having leaves like Woolly Leaves upon them, and at their tops many Tansie Flowers, much like those of the former Tansies.

VII. The Flowers. They are all Garden Plants with us. The first of the three are Natives of our own Land: The Curled Tansie and the Party-Coloured, are Aborigines of England, and are thought to be Degenerations from our first Common Kind, being made by Planting of Ships, which many times looke some parts of their original Stocks, and sometimes add something to them, which may alfo be caus’d in part from the differing Soils, and the wilds of some places in which they are Planted. The first Common Tansie grows in some foreign Southern Countries and warm Climates, by Hedge and Ditch sides, and in the Borders of Fields, and the fourth grows in the Southern parts of France, and other Southern hot Countries.

VIII. The Times. They all Flower in the Summer Months, viz. in June, July, and August, and if the Flowers are gathered in their Prises, will keep their Colour and Beauty for a long time without fading, from whence might possibly come the Greek Name Athonas, or Athonas immortalis, fine Marte, or non Mortens.

IX. The Qualities. They are hot in the second degree, and dry in the third. Tansie is Abstinent, Aperitive, Alleviating, Diuretic, Stomachick, Neuritick, Hypertick, Aristick, Nephtick and Emmenagogick.

X. The Specification. It provokes Urine, forces away Sand, Gravel and Stones from the Reins and Bladder, cures the Colick, terrors Vapours and Hypertick Fits, provokes the Temps, gives ease in the Gout, whether in Joints, Limbs or Stomach, and
 Chap. 682. English Herbs. 1129

XX. The Distilled Water. Sweated with the Syrup, it may be given from two Ounces to a quarter of a Pint or more, against Palting and Sweating Fits, Sickneff at Heart, Ili Digiflion, &c. Outwardly applied, it clears the Face and Skin, making it smooth, soft, white and plenfible.

XXI. The Spirituous Tincture. It has all the Virtues of the Juice, Juice, Infusion, and Powder, and which as it is more powerful than them all, fo it is to be given in a much lofs Dofe, as from one Spoonful to two Spoonfuls in the Syrup, or in a Glass of Stomatich or Diuretick Wine, morning and night.

Chap. DCLXXXII.

Of TANSIE Wild.

O R.

SILVER-WEED.

I. The Name. This it has no known Greek Name, yet it is thought to be the fame which Flacc, Lb. 26. cap. 13. calls Stephanocallis, and in Lb. 25. cap. 9. and Lb. 26. cap. 2. Argemone, Argamn, and others Argemone; in Latin, Potentilla, (ab extimis viribus quibus perplexa:) Argentinum, Tussacum Syphyris,,colerigro Brum- felfo, Argemone altera Gephyre & Tragi; Angi- rina Tabernamentoni; and by some, Agrimonia Syphyris: In English, Wild Tansy, or Silver-need.

II. The Kinds. It is Planta Singularis fat genera; nor do I know any other Author which has given us another Species thereof, it being not a kin to the Tansies.

The Description.

III. Its prime or chief Root runs downward like that of Cuckoo; from whence fpring forth weak fender, creeping branches, almost like Strings, which creep upon the Ground, taking Root again at the joints every where, round about the place where it grows, fo that it will quickly overspread a great Deal of Ground. From these creeping Branches or Strings, four forth feveral rising Leaves, which are large, and made of many felter ones, yet on both fides a middle Rib, some smaller being set among the
Salmon's Herbal.

Tansie Wild: Or Silverweed.

Silver Color underneath. It sends up to Stalks, but the Leaves every one of them in particular, or fans, from the Stalks (with those waved Leaves) of these, creeping Strings, standing upon a small slender, and not very long footstalk. They consist of five small yellow round jointed Leaves, very like to Choke of Chine.

W. Gerard describes it after this manner. It creeps along on the Ground with five slender Stalks and grassing Tenderlets, the Leaves are long and waved, made up of many small Leaves, like very thin, of the Garden-Tansie, but lesser, which are on the upper side Green, but on the under side very White. The Flowers are yellow, and stand upon slender stems, as do those of Cimifolia.

V. The Places. It grows Wild almost every where in most parts of England, and many other Countries; more especially near High-ways, moat places, and running Waters.

VI. The Times. It Flowers in the Prime Summer Months, chiefly in June and July.

VII. The Qualities. It is cold and dry in the second degree; Alarming, Obstinate, Anodine, Vomitive, and Arbish.

VIII. The Specification. It sports all Flowers of the Bowels, even the Bloody Flux; also Spitting, Vomiting, or Pulsing of Blood, or any other inward Bleeding. It helps the White in Women, and is profitable against Ruptures in Children, and is good to dilate Constrictions, falls loose Teeth, and heals Wounds or Ulcers in the Mouth, Throat, Sore, or in any other part of the Body: drying up old, moist, corrupt and running Sores. It re-kills the Fits of Agues, is laid to break the Stones; and is good to cool inflammations in the Eyes, as also to take away all the hardness of the Skin, and to cleanse it from any kind of Defication.

IX. The Preparations. You may have from,

The Virtues.

X. The Liquid Juice of the whole Herb. Taken to 4 or 6 Ounces, 3 or 4 hours before the coming of the Fit of an Ague, it is said to cure it, after some few times taking. It stops all Fluxes of the Bowels, and Bloody Fluxes of what kind forever, whether by the Nofe, Mouth, Bowels, Urinary parts or Worms. If the Whites, is profitable against Cataracts, falls loose Teeth, and is good against Ruptures in Children; and to break the Stones whether in Old or Young.

XI. The Ointment. It is all the former Virtues, besides which, it heals Wounds, cleanses, incrases, and dries up old running Sores, foul Ulcers, and weeping Fistulas. It is also excellent against an Ophthalmitie, starting the Inflammation to admittance, and after a singular manner dissipates Constrictions. Dose: 2, 3, or 4 Spoonfuls or more, in some fit Vehicle Morning and Night.

XII. The Decotion in Wine. It has the Virtues of the Juice and Efficere, but in a lower degree, and therefore is to be given in a much larger Dose, as to half a Pint or more. It easies all pains and Gripings in the Bowels, and helps Fainting of the Spleen.

XIII. The Powder of the Herb and Flowers. It has the Virtues of the Juice; but operates not with that speed, because it must be first digested in the Stomach. It is chiefly given to stop the Cataracta of Agues, splitting and vomiting of Blood, and the Whites in Women. Dose: from half a Dram to 3 Drams, and half, in some Spirit Wine or Decotion, or in the Decotion of this Herb, sweetened with Syrup of Cinnamon.

XIV. The Gargarym. It is made of a Decolation of the Herb and Heads of Flowers, in Red Port or Burbon Wine, with the addition of a small quantity of Alum, fasting it afterwards with Honey. It confolates green Wounds, cleanses and heals Ulcers in the Mouth, Jaws and Throat, they being often Gangred thereby; it cleanses and heals Ulcers also in the Privy parts of Man or Woman, as also in the Legs and other places of the Body; easies the Toothache, falls loose Teeth, strengtheneth and fixes the Gums which are loose and spagyre, and refrestles the Tongue of the Upsets when hurt and weakened, so as to hang down. If the Decolation be made with Water and Common Salt, it dilutes Contusions, diffolves congealed Blood, by bathing with it, and doth also it easies the pains of the Gout.

XV. The Ointment or Balsam. They are very healing, and after cleansing and incarnating of a Wound or Ulcer, they quickly dry it and heal it up.

XVI. The Ophthalmitie. Take the Juice of Efficere four parts, of the Gargarym after the same, two parts, and a Spirit of Wine one part, mix them. It cures Ophthalmitis, inflamed and sore Eyes, and such as are affected with a continual hot, fiery and sharp Rhinum; it also cures running Sores, and Ulcers of the Eyes.

XVII. The
Chap. 683. English Herbs.

XVII. The Carapallon. It is made of the whole Ground Vetch, by boiling in a Mortar. Being applied to the Soles of the Feet, it abates the burning heat of FEVERS, and bound pretty hard on to the Wrists of both hands, and kept on for some days, it extorts Agues and other Contagions. Applied to Gouty parts it eases their pains.

XVIII. The Diffusit Water. It is a cleanser of the Skin from all Diseasfings and Defacations, but it to a Pint of the Diffusit Water you add six Drains of Sal Prunella in fine Powder, dissolving the fame in a gentle Sand heat, and when cold, filtering it thro' the brown Paper, it will perform those things much more effectually, not only removing Freckles, yellowwacks of the Skin, Tanning, Sun-burning, Pimples, Scurf, Morphew, and the like, but withal making the Skin white, soft, fine, and very fair.

XIX. The Spiritualus Tinctoria. It strengthens the Stomach, refills Vomiting, and stops Flusses of the Belly presently. Dose a Spoonful at a time Morning and Night, in a Glass of generous Wine.

XX. The Acid Tinctoria. It prevails against Old Fecit, Rotten and Stinking Ulcers, and disposes them to heal, and is of singular use to quench those all vehemently hot and burning Fever, and to enure and prevent the Poison and Malignity of the Plague or Putrefaction, and of all other malignant and Putrefacitious Difeases. Dose five Drops.

XXI. The Only Tinctoria. It is good against the Gout in the Stomach, and gives ease in the Gout in the Limbs or Joints, Hamiltoned therein. It prevails against Cramps, Convulsions, Palpies, and other cold and mild Distumers of the Nerves, and of the parts affected, and very much strengtheneth them. It gives ease in the Stone and Strasguts, opening the Obstructions of those parts, and expelling Sand, Gravel, and Tartarous Slime from the Sain. Dose from ten to twenty Drops, in some Nephtrick or Diureticke Vehicle.

CHA P. DCLXXXIII.

Of TARE Manured and Wild.

I. The Names. It is called by Galen in Greek, Ibrav, Sicium, as the Aftachea term it: But Selden, and Nupius: Suramum and Synamus, with the Athenians: in Latine, Vica, and in English, Tare or Vetch.

II. The Kinds. There are 1. Vicia Sativa, the Manured Tare or Vetch. 2. Vicia Sylvestris, The Wild Tare or Vetch. 3. Vicia Sylphoria fierce fird, Vicia perennis, Tate Everlasting, of which fee in the next Chapter.

III. The Manured Kinds are, 1. Vicia, Aphaca, and Arcton Matricula, Vicia Saturna, Vicia vulgaris Saturna (Vicia a Vinciendo as Varro will have it from Binding:) Our Common Manured Tare. 2. Vicia Sylphoria alba, Vicia Sylphoria fruifla alba, The White Manured Tare or Vetch. This Gerard calls Vicia India fruifla alba, because it is probable, that it was first brought to us from the Indies.

IV. The Wild Kinds are, 1. Vicia marina Du- carnium Bunium, Cracca major alium, Or Abac- di, Vicia Sylphoria altera Tuorg: The great Wild Hedge-Tare or Vetch. 2. Vicia Sylphoria alfus, Vicia Sylphoria altera Wild Tare or Vetch. This Parkinson says it is the fame with Dobosus his Galaga altera, and also with his Vicia ombraphilis alba, and may be called Vicia Syl- phoria Alumnum, or Wild Wood Vetch. 3. Vicia multiflora fine Scipio, The Tied Tare or Vetch. 4. Arachis five Cracca major (which is the Aegres Galbus) Vicia major Trigae, The greater Wild Vetch or Tare. 5. Arachis five Cracca minor, Theilder Wild Tare or Vetch. These two last Dobosus thinks may be that kind of Pals growing among Corn, which the Greeks call Asago, Arachis. Of all which in Order.

The Descriptions.

V. The fift of the Manured, or our common Manured Tare. Its Root is small, with a great number of Strings, and perifhes every Year. It rife up with divers fquare Stalks, sometimes two Feet or more long, extangling themselves one with another, that they stand on the Field without need of any Prop or Staff. The Leaves are winged, thicker fett together than in the Wild Kinds, and growing on both fides of a middle Rib: the end of which, runs out into a detached Tender or Claffier, which are larger fett than thofe in the Wild Kinds. The Flowers grow two together, and are long and nar-

Tare or Vetch, Manured.
The Tasters are like to those of the Garden Bean, but of a black purple Color. The Codz are broad, small and long, containing for the most part, 3 or 6 Grains in each, of a blackish color, flatish, and of no very pleasing Taste.

VII. The Second Manured, or white Manured Tare or Vetch. This in its Root, Stalks, Winged Leaves, Stalk or its Flowers, or their Color, Size, form and manner of growing, nor scarcely in any thing else, differs from the Common Tare before described, saving, that this grows higher, the Leaves are not so thick, and the Fruit is larger and rounder, and of a very clear white Color, more like to Peas than Tares.

In describing the Wild Kinds.

VIII. The first of the Wild Kinds, or the Great Wild Hedge Tare or Vetch. This has a creeping and lying Root, growing much like to the first Manured Tare, but is larger in the Size, and number of the Leaves. Its Stalks are crooked, being between 3 and 4 feet in height. The Leaves are Winged, commonly a dozen growing upon one Rib, which ends in a Vining Tender: Each peculiar Leaf broader towards the bottom, and shorter towards the top, which ends are flat, but somewhat pointed. Out of the borders of the Leaves, towards the top of the Stalk, grow (as short footstalks) two, three, or more, pretty large Peas fashioned bluish Purple Flowers, which are somewhat large, but shorter than the former. The succeeding Pods are like the first, but shorter and lesser, and of a blackish color wherein ripe, which then fly open of themselves, and show their contained Seed or Grains of a blackish Color also. This from Tatura judges to be the Aparce Dioscoridis.

Tares Wild Small.

IX. The second, or small White Wild Tare or Vetch. Its Root is perennial, as many of the Wild Kinds be, it sends up crooked Branches about a foot and half high, growing in Form like unto the other, having thereon the form of the former, are of a whitish Color, with dark Purple Veins running the same. The Codz are like that of the Common Tare, and the Seed is flat like them also.

X. The third or Twelfth Tare or Vetch. Its Root creeps under Ground for about, shooting out new Branches every Year, the Old ones being perished. It has such like trailing Branches as the others have, but nothing, the Winged Leaves are more in number, 1, 2, 3, 4, or more, feet upon a Rib, longer and narrower than the former, and standing more upright, but they are not always set exactly one to another, but unequally. The Flowers likewise, which stand upon long naked pedicels, are more in number, sometimes twenty together, but smaller, and something like to the Flowers of Onobrychis, or Cocke-head, and of a bright bluish purple, and of a fecond, or more times of a Vetch unto some White in them. The Codz are long, containing within them black Seed.

XI. The fourth, or the greater Wild Tare or Vetch. This kind is found about every Year. It has a few slender Croched Stalks lying on the Ground, if it finds nothing on which it can climb or take hold. At the joints come forth Winged Leaves; in the number of these, many small pods, or the like, as the first, but shorter and lesser, and of a black color wherein ripe, which then fly open of themselves, and show their contained Seed or Grains of a blackish Color also. This from Tatura judges to be the Aparce Dioscoridis.

XII. The fifth, or Lesser Wild Tare or Vetch. Its Root is fibrous, and has several small white Kernels hanging among them. This differs nothing from the former, but in its smallness, excepting this has whitish Flowers hanging in Tufts at the tops of the Stalks. The Codz which follow, are shorter and something hairy, and the Seed or Grains within, White.

XIII. The Flowers. The two first kinds are Sown in Fields for their profit of Feeding Cows, either with the Grain or Straw, or both, and of the Grain the poorer sort of People in many Countries, are force to make Bread, Cakes, Puddings, &c. The Wild kinds are found by Hedge Sides, in Woods and moyst Grounds, and among Rocks in many parts of this Kingdom; for they will grow in any Ground or Soil whatsoever. The fourth and fifth of the Wild Kinds are often found in the Fields among Corn, where they will in a rainy Season quickly overspread it, and kill it, or any other Herbs they grow by.

XIV. The Times. The Manured, and the third of the first Wild Kinds, Flower in May and June; the fourth and fifth in July, and the Codz or Grains are ripe in August or September.

XV. The Qualities. They are temperate in respect to heat or cold, dryness or moisture; Affum- pate, Glutinative, Vulgarly, and Refor late.

XVI. The Specifications. They Stop Fluxes, and cure running Ulcers and Cancers which are ready to Gangrene.

XVII. The Preparations. You may make of them, 1. Bread, Cakes and Puddings. 2. Potage. 3. A Molec or burner. 4. A Cataplasme.
The Virtues.

XVIII. The Beet, Cole, Peaing, &c. They are made and used constantly in many Countries, among the poorest sort of People; which the coarse Food, and something hard of Digestion, yet nourish much: And in many other places they are forced to be eaten by all sorts of People, in times of Famine.

XIX. The Potage. It is made by boiling them soft in Water, then adding thereto Malt, Pork, Cabbage, Colewort, and other Herbs, or Milk. It nourishes very much, restores in Contumacies, and stops Fluxes of the Bowels.

XX. The Meal or Flower. Applied plentifully to Bleeding Wounds, and old running Sores, it stops the Bleeding, and the Flux of Humors to the parts, more especially, if an eighth or sixth part of Rock Alum in fine Powder be added to it.

XXI. The Capulisinum. It is made of the Meal or Flower being mixed with Milk, or Smith's Forge Water. Being applied to running Sores or Ulcers, it stops the Defluxion, cleanses them, and prevents a Gangrene if approaching, and being laid warm all over the whole Body, it stops Fluxes of the Bowels.

XXII. Notes. The fourth and fifth of the Wild Kinds, are Pulses with which Doves or Pigeons are much delighted: And altho' the Fowls are wild, yet where the Dove-Houses are kept here with, they will return to the same, and in some little time become Tame with the rest. And therefore in some Countries, whole Fields are Sown with them to serve for that use.

CHAP. DCLXXXIV.

Of TARE Everlasting.

I. The Name. It is called in Greek, Λακτυρία, in Latin, Lathyrus perennis; in English, Lathyrus, or Common Vetch. For being applied to running Sores or Ulcers, it stops the Defluxion, cleanses them, and prevents a Gangrene if approaching, and being laid warm all over the whole Body, it stops Fluxes of the Bowels.

II. The Kinds. We make two sorts hereof, viz. 1. Lathyrus perennis; Lathyrus Syringifer, flower later, Vicia peperom, Vicia Syringifer flower later; Tare Everlasting, properly so called. 2. Vicia Syringifer, Vicia Syringifer vulgaris, Strange Tare, and Common Wild Tare.

The Descriptions.

III. The first, or Tare Everlasting. Its Root is small and rough, running infinitely under Ground, fearlessly to be destroyed. It is a ramping Wild Tare or Vetch, and is the most pernicious Herb that can grow on the Earth, for Corn or any other Herbage, by over-running, strangling as it were, and killing them: It sends forth long rough trailing Stalks, having small, long, and sharp pointed Leaves for an end opposite to another, at due distances, with Tendrels or Ostriches at the ends of the Branches: The Flowersstand upon pretty long footstalks, proceeding from the bottom of the Leaves, which are many upon a Stalk, and yellow, after which come small round Cuds with blackish small Grains with them.

IV. Gerard describes it thus. Its Roots are very small, long, tough, and in Number infinite; insomuch, that being once gotten into a Ground, it is almost impossible to root it forth, unless the Earth be digged up with the Roots, and barb cast into a River or Burned. From these Roots spring divers very small ramping Stalks, tough, and leaning this way and that way, not able to stand if themselves without the help of Props, or something standing by them to be a Support. The Leaves are very thin, and sharp pointed. The Flowers grow among the Leaves, in form like Peas Blossoms, but of a bright yellow Color. Doubtless this is one of the most hurtful and pernicious Weeds that grow, to all manner of green Herbs, or any Wood color the. Johnston says, for the resemblance it has to Aphasia, be as to call it Aphacoides.

V. The second, or Strange Tare, or Common Wild Tare. Its Root is long, flender and springy, from whence springs up many slender weak Branches: The Leaves are winged, and much smaller than in the Common Mustard Tare, round or broad pointed, and sometimes dented in the middle of the end, standing upon a middle Rib, which ends in clasping Tendrels: The Flowers are of a Purple Color, and commonly grow but one at a joint upon short Footstalks, after which come long, flat, sharp pointed Cuds, which contain for the most part, 9 or 10 Grains or Seeds in each. In some Countries this Plant is called Tine; it is a ramping Herb, like to the Common Tare, climbing up upon Corn, if it chances to grow among it, and will there press or bear it down to the Ground, and overgrow the same in such a manner, that it strengthens, fruits and kills it, not only Wheat, but all other Crops whatsoever. So that among Country Farmers it is better known than defined.

VI. The
Salmon's Herbal. Lib. 1.

VI. The Places. The fish is generally found in Fields and Orchards, and other like places; also in Griftye Pature, Borders of Fields, and in Corn Lands almost every Where: It is found other Where than the Owners of Grounds would have it, being a kind of Plague, or mighty Incurrence to any place where it once gets footing. The second grows generally in Ploowed Lands, where it becomes the Husband-Man's Vexation in hurting and destroying his Corn. But both these Plants will grow in any Ground or Soil whatsoever.

VII. The Times. They Flower in the latter end of May, show all June, and sometimes in some part of July, and the Grain is ripe in August and September, sooner or later, according to its time of Flowering.

VIII. The Qualities, Specification, Preparations and Virtues of these, are the same with those of the Common Manured Tare, in the former Chapter; so that no more need be said of them in this place. The Grain may be made into Meal or Flour, or boiled into Pottage and eaten, as other Pulses are; but these are of a thicker Constitution, and therefore may be thought to nourish very much: With out doubt in time of Famine it would be an acceptable Food; at other times they are not eaten, but the Grain, as also the Straw, are Food for Cattle, as nourishing them exceedingly.

CHAP. DCLXXXV.

Of TARRAGON.

I. The Name. It has no Greek Name that we know of, but it is called in Latin, Tragon, Tragum vulgaris Grafi, Tarthius, Vranco, or Tarragon, Hortus, and in English, Tarragon.

II. The Kinds. It is Singularis sui generis, the sole kind have held it not to be an Herb of its own Kind. And Raellius was of that vain and Erudite Opinion, That it was first produced by putting Linseed into the Root of a Radish, or of an Onion being opened, and so set into the Ground, which when it springs up, brings forth this Herb Tarragon, whereof Folly, Matthew, by certain Experience Eys, has been found False.

The Descriptions.

III. Its Root is white, and creeps about under Ground, by which it much increaseth. It has many long, narrow, sharp pointed green Leaves, sometimes of a dark green, and sometimes of a more light Color, growing upon short slender stalks; which are so numerous, as even to hide in a manner the Stalks themselves, which are of the same Color, round and brittle, sometimes two Feet or more high; at the tops of which come forth slender Spikes, of small yellowish Flowers, which seldom give any good Seed, but a duffly or chaffy matter, which is dispersed with the Wind, the whole Herb is of a hot and biting taste.

IV. Gerard describes it after this manner. Its Root is long and fibrous creeping far abroad under

Ground, as do the Roots of Quick-Graft, by which spoiling up, it increaseth, yielding no Seed or all. It has long and narrow Leaves of a deep green Color, longer than those of our Common Garden Hyssop, with slender round brittle Stalks, about two Cubits high. Round the Branches whereof spring forth little round Flowers, which never perfectly open, of a yellow Color mixed with black. The thyme of Common Wormwood: after which succeeds a certain Chaffy or Duffly matter as it were, which flies away with the Wind.

V. The Places. For all that I know it is a Native of England, and grows with us only in Gardens, where if the Ground is good it nourishes admirably.

V. The Times. It is green all the Summer Months, and a great part of Autumn, and Flowers in July.

VI. The Qualities. It is hot and dry in the end of the second Degree: Aperitive, Attractive, Astringive, Digestive, Diuretic, Diuretic and Traumatick, Stomachick, Chaffy, Nervous, Cardueck, Splenick, Nephritic, Astringick and Hydropick, Emmenagogick, Sodicick, and Alexipharmick.

VIII. The Specification. Tarragon refists Vomiting, refines Appetite loth, curset Convolutions, Pallies, Trembling and Weakness of the Limbs or extrem Parts is prodigious, and a Leucoplogmatik, expels Wind, gives ease in the Cholick, provokes Urine and the Terms in Women, and is an admirable Remedy against the Scarry in a cold Habit of Body.

The Virtues.

X. The Liquid Juice. It is an Antidote against a Scorpion Scurvy, provokes against an Inept Laxation, it is good against Puttings, Weakness of the Stomach, want of Appetite and Digestion; Strangury, or Stoppage of Urine, into Stones, gravel, sand or Tartarous matter adhering the Urinary PUffes. Dole one or two Spoonfuls in Glafs of White Liquor, or other Diuretik Wine Morning and Night.

XI. The Effufes. It has all the Virtues of the Juice, but more potent, warming and comforting the Stomach and Vlcca; it diffolves and expels Wind, gives life to the Cholick; is prizable against Convulsions and Pafies, refuits Vomiting, causes Appetite, and admirably provokes theTerms in Women. Dole one or two Spoonfuls in Wine as aforefaid.

XII. The Diffillation in Wine. It has all the Virtues of the Juice and Efufe, but much weaker, and therefore may be given to half a Pint at a time, accompanied with Syrup of Cheneisifhftewars, Vinifcs, or North Amber. It heals inward Wounds, and being drunk coldly at Physical Hours, it diffolves old running Sores and Ulcers to heal, more especially if it be outwardly wherefore therein, being well fomerated with a little Honey.

XIII. The Diluted Water. It is fometimes used as a Colofternik to Beautify the Face and Skin, and to take away the Delufions therefrom, which it does more efcalifically, than either Sal Pratca, or Scab.urrum Saturni, (half an Ounce of either of them to a Pint of the Water) be diluted therein. Immoderately taken, it has the Virtues of the Juice and Efufe, but in a far weaker degree; however it is profitable in Obliterations of the Reins and Bladder, if it be taken 3 or 4 Ounces at a time, infused with Syrup of Arfifti Malts.

XIV. The Spiritual Tincture. It comforts and warms the Stomach, strengthens it, and creates a good Digestion: And after due purging off the Morbidik matter, it is very profitable against the Paffic, CoUics, Gout, Dropifly and Scurtv, repor- ting after an exceflant manner, the depraved Tone of the Vlcca. Dole one or two Spoonfuls at a time in a Glafs of Wine, or well mixed with Syrup of Aethers, and this, Morning, Noon, and Night.

XV. The Acid Tincture. It is Antifeptic, Antipellitic, and Anti-Scurvy; it cools all preternatural Heats, expels Pafias, and isingularly Afghaniftic, refulting not only Vegetable Poions, as thofe of Henbane, Monkifh-Head, Night- shade, Wolfsbane, &c. but alfo Animal Poions, as thofe of the Biting of Serpents, as Vipers, Ruffle-Snakes, Mad Dogs, &c. and the Stings of Hornets, Scorpiions, &c. Dole fo much as to give the Vehicle (which ought in this cafe to be some Sort of Afghaniftic Whine) a pretty sharp acid taste, fo as it may be tolerably drunk.

XVI. The Only Tincture. It is profonally given against the Strangury, Stones, gravel, Sand, and Tartarous matter in the Reins, Urinets and bladder, it takes away the heat and fulling of the Urine, gives cafe to the pains of the Bladder, and strengthens it, it is good against CoUics, and of singular ufe in inward Convolution, as also in Pal- fies, being taken from 15 to 30 or 40 drops (according to Age and Circumstances) in any appropriate Liquor, and every even or morning, continued with qd outside any paincd, cold, weak, or borne-
Teaflle Manured. From among these Leaves rise up the Stalks 3 or 4 Feet high, armed from the bottom to the top, with small hard, short, and sharp Prickles, jointed at several places; and two such Leaves set at them, both of which Leaves are so joined together at the bottom or joint, so as to compass the Stalk about, that they do contain the Rain or Dew which falls upon them, being something harder and flijfer, and more pricked than the lower Leaves, as was before hinted. From between the Leaves and the Stalks on each side, spring forth Branches prickly also, and with joints, set with the like encompassing below Leaves, but fijfer. And from their juncture long prickly Stalks, but bare of Leaves, having on their tops, a round Head something long, armed with short, short, and crooked Prickles, fashioned like Hooks, bending their points downwards and upwards. In the several Cells of which Flowers, is contained the Seed, which is small, somewhat long and round, and of a whitifh Color, almost like Fennel Seed. The middle part of the Head is always bottome, which being opened, you will find it to contain one or more whitifh Worms, almost like Cattapillars, which are the Head being ripe) for the most part found Dead.

IV. The second, or Wild Teaflle. Its Root is like the former, so also its Stalks and Branches, which are full of sharp Prickles. Its Leaves are smaller, yet longer, but narrower, armed on the underfide of its middle Rib, with the like sharp Prickles. It has like Heads as the former, which bring forth like Flowers, knowing that they are of a fine Blaff, or Pale Carnation, or Delicate Purple Color. The Prickles on the Heads of Flowers are small, fijfer, and upright, nothing so hard, or sharp, as the other; and so not hooked, or with their Points bending downwards as the former: And the Seed is like the same, with very little Difference. In the
Chap. 687. English Herbs.

the bottom of the middle, there is generally found one long Worm, which in Form and Shape much resembles a Caterpillar, and of a black Color.

Wild Teafe.

but (the Heads being full ripe) it is for the moft part found Dashed, like as in the Martorpe.

V. The Places. The flritt is only Sown in Gardens or Fields, for the sake of Clothworkers. The second grown in wild and waste Places, by Hedges and Ditch sides, also in moist Grounds, near Brooks, Hills, and standing Waters, in almost all parts of this kingdom.

VI. The Times. They flower for the moft part in June and July, and the Heads with the Seed are ripe in August, or not long after.

VII. The Qualities. The Teafe is said to be cold and dry; Geddes says it is dry in the second Degree, and Merrioot, or of a cleaning Faculty.

VIII. The Specification. It cures Wounds, cools Inflammations of the Eyes and other parts; and is profitable against Frenzy and Madness.

The Virtues.

X. The Liquid Juice of the Leaves. If it is dropped into the Eyes, it kills Worms in them, Smitt up the Nodles, and bathes upon the Forehead and Temples, it eases the pain of the Head from a hot Caffe, and is good against Delirious.

XI. The Catephalum of the Roots. It is made of the Roots bruised and boiled in Wine to a Judy thicknes, after which it is put into a Beafe or Copper Basin, or Pot, to be Tinted with the Vermbr of the same. This is spread upon Pudders of Tow or fine Flax, and applied to the Fundament, heals the Clefts thereof; as also Ters, Carters, Ulcers and Fistulas thereto, and applied to Warts and Wens, it makes, carries, and takes them away.

XII. The Catephalum of the Leaves. Beaten and in a Mortar with a little Spirit of Wine, to which some Safflower and Opium are applied, and applied to the Forehead and Temples, it allays the preternatural heat, gives present ease to vehement Head- aches, and drives the Frenzies of Frenzy and Madness. Applied also to pires painful with the Gout, it becomes in the same.

XIII. The Distilled Water of the Leaves. Being drops into the Eyes, it is good to cool their Inflammation, and take away Bloom Shot, and clear them of such Mistis, &c. as darken the Sight. The Face and Skin being fresh washed with warm Water, and wiped with a Cloth, and then washed with this Distilled Water, it preserves the Beauty and Finenes thereof, and it still redores it again, taking away Redness, Inflammations, Pimples, Breakings out, Scurf, Morphew, Scabs, and other like Defadtions. But it will be too much the more effectual, if to every Pint of the Water, 2 or 3 Drains of Safflower Saturni be added, and dissol- ved therein.

TETTER-BERRY, see Bryony, Chap. 69.
TETTER-WORT, see Celandine, Chap. 120.
THEE, see Lib. II. Chap.

CHAP. DCLXXXVII.

Of THISTLES Common and Wild.

I. THE Names. The Thistle is called in Greek, 
Chape 4 and Synnechi, (which is also and all Authors translate by the General Name Carduus;) and Ager, (which is also a Common Name for all kinds of Thistles:) but these two latter Names are also peculiar to two singular Kinds of Thistles, viz. 1. Cardus marianus or Cardo marianus, which is better Theophrastus, 1. & 2. Gaerness Scilumus, The Wild Hertichoake, which see in Chap. 339. foregoing. 2. Ager albus or Ager, 1. c. Brancauro- Gius, Bears-Breech, which see also in Chap. 56 of this Book. In Latine, the general Name is Cardua, pl. Cardui, to which for every particular Species, some proper Epithet is commonly added. The Prickly Heads are called Igis, Echinus.

II. The Kinds. All the kinds of Thistles are too many to be either Named or Treated in this Work, which would be as Vain as it would be tedious and tedious, many of them being insignificant as to their Virtues, and many others Natives of Foreign Countries, and to perilous to strangers to us, that possibly they might not be seen by an English Man in many Ages. We shall therefore treat only here of those which are most Common and Wild in our Land. Fifteen Species of which, we shall discourse of in this Chapter, viz. 1. Cardua communis, Cardua varum & Vineaurn, Caesuor Theophrasii, 1. & 2. Angustulà & Colonna, Cardua Pumila & Thistle (because its Root creeps much under Ground:)

7 F Cardua.
Salmon's Herbal.  Lib. I.

The Descriptions.

IV. The fifth, or our Common Highway Thistle. Its Roots are very small and white, running both deep and far about under Ground, like unto Quick-Grafs, but not knotted in the joints like it, but shoots up heads of Leaves from the Branches of the Root, so that it will be as bad or worse than Quick-grafs, to root out of any Ground or place, where it is once got in. The Leaves are of a pale green Colour, somewhat like unto the rough or prickly Sow-Thistle, a little cut in, and as it were crumpled on the edges, armed with very small and sharp hard prickles. The Stalk grows to be about a Yard High, sturdy and prickly, with some Laths like Leaves thereof as the lower lea, but runneth forward towards the Top, where it is armed with cruel sharp, hard, prickly Heads, repeat with Purple Flowers made of Thorns in the middle, which afterwards pass into Down, in which it is wrapped the Seed.

V. The second, or moist Prickly Thistle, or Thistle upon Thistle. Its Root is long, slender, and branched forth, bearing several Ylbers adhering to it, not running very deep into the Earth. The
Chap. 687. **English Herbs.**

**Affes Thistle.**

VII. The fourth, or another Narrow - Leaved Way - Thistle. Its Root, Form and manner of Growing, is much like the former, but it differs in this, that the Leaves broid are larger, narrower, more thick, or rent in on the edges, and not hairy, but smooth all the Leaf over. It has Heads of Flowers which are Purple like the other, but sometimes white, in six Prickles differing little or nothing from other Thistles, and when the Flowers are pale, there remains the Down and Seed, like as in all others of the Species.

VIII. The fifth, or the Gentle - Way Thistle. Its Root, Stalk, and manner of Growing, is very like the former, but it differs chiefly in the Heads, which grow many together, and are thin or frit, with Prickles, nothing near so much as some of the others, but the Leaves are more jagged, and frit very thick with short Prickles. The Stalks are round and a little prickly, but not lined as the former, and at the tops of the Stalks and Branches are feavy Heads, of like Purple Flowers, containing nothing them Down and Seed.

IX. The sixth, or the Affes Eating Thistle. Its Root is about a Foot long, thick and black, with some Vines adjoining to it. It has many long Leaves, set on a broid Woolly Stalks, which grow sometimes almost to a Man’s height, but not Branched on all, the Leaves fering like Branches, being a Foot or more long, and much divided into many other Leaves, some long or narrow, others smaller and shorter, set with them at certain spaces, each ending in a sharp long Prickle. From the upper joints of the Stalks with the Leaves, and at the tops of, come forth Woolly Heads upon short Forks, set with long Prickles, from the midst whereof, from forth several bright reddish Purple Threads, which are the Flowers, which being pale away, there remains the Down containing the Seed, in like manner as in other Thistles.

X. The seventh, or the Lancing Thistle. Its Root is white and thick, not green or yellow, it rises up with very slender Stalks, sometimes almost to a Man’s height, whose top and upper Leaves are made up of many parts, finally cut in or divided into many small pieces, such as the Stalks enroaching the Stalk at the lower end. At the tops grow Angle, fisby, green, Prickly Heads, from whose middle comes forth the flower, which is sometimes affixed to some Whiff, and in others very red, or of a bright Crimson Colour, which consists of a great number of long Threads like a Thrum. After the Flowers are pale, there remains the Down, in which is contained the Seed, which is small, smooth, and reddish.

XI. The eighth, or Broad Leaved Field Thistle. Its Root is something long and thick, abiding several Years, which sends forth several large and long Leaves, cut in on the edges, and every part finely dented, and fit with small Prickles which are very tender, of a white or green Colour. Those which grow higher upon the Stalks are smaller, two of them frit together at a Joint, where they do encompass the Stalk, that they may contain or hold Water in them. At the tops upon long Stalks, grow Angle green Prickly Heads, out of which come pale Cylindrical Thorns, encompassing a few Purple Threads in the middle. After they are faded and gone, there remains the Down, as in all other Thistles, in which is contained small whitish Seed, something larger than that of Cypress, Corn - Flowers, or Blew-Borde.

XII. The ninth, or Yellow Jaggd Meadow-Thistle. Its Root a great, long, crooked and spreading in the Earth. It has very large Leaves, almost a Foot long, and somewhat broad, cut in both sides into 4 or 7 deep Cuts, even to the Middle of the Stalk. A few of these are made long, and frit with Prickles at the Dents of the Edges. From whence rises up a flexed Stalk about two Feet high, frit with a few long Leaves, at the tops whereof, stand several small green Prickly Heads, out of which come yellow Threads or Thums, which afterwards yield Down, in which is enclosed the Seed.

XIII. The tenth, or the Bulbed Field Thistle. Its Root is composed of several Tuberous small long Clugs, like unto those of the Alphodil, fastened together at the Head. The Leaves are whitish, of an Island breadth long, something frit all over in on the edges, but not very deep, armed at every Dent with small sharp Prickles. The Stalk is about a Yard high, hairy and slender, with few or no Leaves thereof, at the top of the Stalk are many small Prickly Heads, standing upon long Foot-Stalks, out of which come pale Purplish Threads or Thums, and after them much Down, in which the Seed is contained.

XIV. The eleventh, or Meadow Thistle with Alphodil Roots. Its Root consists of several, or many long blackish Tuberous Clugs, like unto those of the Alphodil or Penny, which are falt and together at the Head, which after Seed time, summer and perish every Year. From whence come forth several thick, long, pale, green Leaves, cut in many parts, and armed with sharp Prickles on all Edges, every Prick ending in three Points, from among them rises up a small Stalk, a little branched, with one or two Prickly Heads at the top of every branch, out of which come purplish Threads, and besides which are the slopes, and after them the Down, enclosing small long Seed.

XV. The twelfth, or the many Headed Meadow Thistle. Its Root is long, hard and woody. It has but few Leaves lying upon the Ground, being both short and narrow, armed with sharp and long Prickles,
Salmon's Herbal. Lib. I.

Priestis. The Stalk is round, forked, and without Prickles, spreading it self into several Branches, bearing many small Heads with Threads or Thrums of a purplish Color coming out of their middle, which confute the Flowers, which Heads are set with large and sharp Prickles, after which is the Seed inclosed in the Down, as the rest are.

XVI. Palpaphilen alter. There is another many Headed Thistle, whose Root is hard and woody. Its Stalk has neither Film or Prickles, but branched forth into divers parts, and they again into other smaller Branches, on which stand many Heads, and smaller ones under them, with several small prickles about them, out of which rise purplish Thready Flowers as in the other. The Leaves are but few on the Stalks, being short and narrow, but as thick set with Prickles, as the second or most Prickly Thistle, at Sect. V. above.

XVII. The thirteenth, or Marsh, or Soil Meadow Thistle. Its Root is single, the Stalks about 4 feet or more high, fruite and full of prickles, thick set with dark green Leaves, acuminously caused, and sometimes more deeply cut in on the edges, having a few prickles at them, and branched towards the top, with many small Heads upon slender Foot-Flowers, which bear purple Thrum Flowers, and turn into Down, in which the Seed is inclosed, like as in other Thistles.

XVIII. The fourteenth, or Oate-Land, or Musked Thistle. Its Root is small and long, perishing at the approach of Winter. It has an upright Stalk, and rises up in Corn and Oat-Lands, some-

Thistle Oate-Land: Or, Musked.

edges, in 2 or 3 places, set at distances one from another, and the several parts cut into 5 or 6 points or corners, sharply armed, the ends being long and narrow, pointed like the Head of a Javel- lin or Pike, ( whence came the Name: ) The Flowers are purplish in feely prickly Heads, after which comes the Seed wrapp'd up in Down, as in other Thistles.

XX. The Places. All these Thistles Grow Wild by Way-Sides, in Fields, Meadows, Or-chards, Gardens, and in Corn-Lands in most places of this Kingdom, as also in many other places be-yond Sea; alio on Heaths, Greens, and Waste pla-ces up and down almost every where. The thirteenth grows in most Meadows, and the fourteenth in Oat-Lands, and other Corn-Lands, of Gerard says, it grows in the Fields about Cam- bridge, and I have seen it in some other places adjacent to it.

XXII. The Time. They all Flower from the beginning of June to the end of August, and their Seed is ripe in some little time after.
The Virtues.

XXV. The Liquid Juice or Essence of the whole Plant. (Pliny ib. 20. cap. 23.) says, That if any bald place be Bathed with the Juice, it caueth the Hair to grow again quickly. And if the Juice or Essence be made before Flowering, and Drunk, he says they help a Stinking Breath, and strengthen the Stomach, so that it is probable they may be good for the Cure of the Scary, that always begining in the Stomach, and being called by the Greeks, the Stomach Dyspepsia: Dose 2, 3, or 4 Spoonfuls, in a Glass of Stomach Wine, Morning and Night.

XXVI. The Decotion of the Roots in Wine. Galen says, that it drives forth Stinking Urine, and takes away the rank or evil Smell of the Arms-holes, and of the whole Body. Dose half a Pint, Morning, Noon and Night.

XXVII. A Decotion of the Leaves and Heads of Flowers when boil'd, in Wine. It has the Virtues of the Juice and Essence, but much weaker; as also of the former Decotion of the Roots, and may be taken in the same quantity and manner. It is certainly an Amtalote against the Scary in a Cold Habit of Body.

XXVIII. The Infusion of the whole Plant when boil'd beginning to Flowers, in strong Wine or Brandy. It has all the former Virtues, but more effectual to comfort and strengthen a cold and weak Stomach, and to refit a Cold Scary, as also to caueth a Sweet Breath, more than any of the former Preparations. Dose 2 or 3 Spoonfuls, sweetened with any proper Syrup.

XXIX. The Masticatory. Pliny says, that being chewed in the Mouth, it cures a Stinking Breath. But this I suppose is such an offensive Breath as is caused by thinking or rotten Teeth, or some Sore or Ulcer in the Gums and Mouth, it drawing away a great deal of Rheum, Purulent and Putrid Stinking matter from the same.

XXX. The Caraples of the Root. Dioscorides says, that being applied, it corrects the Stinking and Filthy Smell of the Arm-Pits, and of the whole Body.

Chap. DCLXXXVIII. Of THISTLE Blessed: OR, Carduus Benedictus.

I. THE Names. It has no Greek Name that we know of, but it may well enough be called, *Augea Thistle,* in Latin, Carduus Beneficillus; and in English Blessed Thistle: But we often call it by the Latin Name, as Carduus, and Carduus Benedictus.

II. The Kinds. It is a singular Plant of the Species; but some will have it to be a sort of Arraspike, or Wild Buffard Saffron, which I can hardly admit.

The Descriptions.

III. Its Root is white, long and Fibrous, persifling every year after it has given Seed. It has many weak tender Branches, lying for the most part on the Ground, on which are set long and narrow Leaves, much cut in or waved on the edges, which are hairy or rough in handling, yet without any hard or sharp Prickles at all, so that the tenderest hand
Salmon's Herbal. Lib. 1.

may such them without burns; but those which grow towards the top of the Stalks are sooner prickly, and the Heads which grow on the top of the several Branches, are sometimes sharp, yet with Prickles like a Thistle. The Flower is yellow, which being put away, a Head enforces a quantity of Woody or Hackly down, in which is contained (as in all other Thistles) the Seed, which is blackish, long and round, with a few Hairs on the Head thereof.

Gerard describes it after this manner. The Root is white and parted into Strings. The Stalks are rough, round and pliable, which being parted into Branches, do lie flat on the Ground. The Leaves are jagged round their edges, and fall of by means of Prickles. The Heads on the top of the Stalks, are also lost with Prickles, and environed with sharp and prickling Leaves, out of which comes forth the yellow Flower, the Seed is long, and compound, while Hairs like a Beard, The whole Herb, Leaves and Stalks, are also the Heads, are covered with a felt and thin Down.

V. The Places. It grows with us as only in Gardens, where it flourishes admirably well, but in the Island Lemnos, in the Mediterranean, where it grows naturally, it grows wild in Champion Grounds and Fields, as Petrus Bellusius says. VI. The Times. It Flowers in July and August, in which times it is to be gathered for Medicinal Utes, and then it will keep good a whole Year or longer.

VII. The Qualities. It is hot and dry in the second Degree, Abfective, Aperitive, Diuretic, Anodyne and Alexipharmick.

VIII. The Specification. It is good against Agues, Maligns and Pestilential Fever, recent Scurfies, Fluories, Stone, Gravel, Vertigo's, and the Bitings of Mad Dogs, and other Venomous Creatures.

The Herb is chiefly used.

The Virtues.

X. The Liquid Juice. Put into the Eyes it clears the Sight, taking away Blood-shot and redness, drops into the Ear it eases the pain thereof: It kills Worms in the Belly, and given from an Ounce to two Ounces, in any proper Vehicle, it is good against Quaran Agues and the Plague, as also recent Scurfies, and admirably cleanses a foul Stoumacht.

XI. The Decotion in Wine, Water, or Poffert-Drink. It is good against Agues of long continuance, and Pestilential Fevers, which if timely given, it has the greater Efficacy, and it also profitable against Puerilities, and Stitches in the Side. It is good against Vertigo, and Deafness, and strengthenes the Memory. It provokes the Terms in Women, is good against the Stangury, as also Sand and Gravel in the Urinary parts.

XII. The Powder of the Leaves. It stops Bleeding at Nose, and is given from half a Dram to a Dram, against all the aforesaid Difficulties. It is Sudorific, and cures all sorts of Agues, being given from six Hours before the coming of the Kit, for several times together.

XIII. The Extract. It has all the former Virtues, and being given from half a Dram to a Dram or more, it particularly is laid to cure the Quaran Ague, and all Worms in the Bowels, and is a Speciment against the Lues, or French Fece.

XIV. The Cataplasm. Made of the Green Herb and applied, it is good against hot Tumors, Ye- floors, Bohns, Bolls, Plague Sore, the bitings of Mad Dogs, Serpents, Spiders, Stingings of Venomous Creatures, &c. But made up with Hogs Lard and Wheat Meal, and applied, it cures Sumborn or rebellious Ulcers. The Cataplasm made of the Juice with Orbas Meal, is profitable also against Gangrene.

XV. The Dew in the Heads. Applied to simple Green Wounds it stops the Blood, and presently heals them: Applied to Ulcers after Cleaning and Incarning, it causeth a speedy Cure.

XVI. The Distilled Water. It is said to have all the Virtues of the Decotion, but is nothing near so efficacious, tho' much more pleasant to be taken. It is esteemed a peculiar thing for the Eyes, and help their Sorrows, and a Dimness of Sight.

XVII. Roger Dixon's Antieffential Sudorific. Take Leaves of Cardus Medicus, 9 Parts, of Butterbur, 9 parts of each, Poffert Drink 3 Quarts, make a Decotion and distil it out. If you have not Poffert Drink, you may make it with this Water Gruel. With this Drink, he told me, he cured many Hundreds of the Plague (when the half Great Plague was in London, Anno 1665) who, by drinking largely of it, were Cured (many of them) in the space of twenty four Hours, when nothing but Death was expected: and thereby he also stayed Pestilential Vomiting and Loosendles. It produces a potent Sweating, an Hour or two. In the Sweating, he gave the Sick Mutton or Chicken Broth, or some proper Aleipharmick Poffert Drink, wiping the Sweat from the Face and Neck with warm Cloths, but forbearing to Shift the Patient; and this Course he took every Day, till the Malignity of the Diseafe was wholly rooted out.

C H A P. DCLXXXIX.

Of THISTLE Cotton: OR, Woolly Thistle.

I. T H E Names. It is called in Greek, Βατόμεν, (being supposed to be the Acacanthum of Dioscorides) in Latin, Acanthus, Carduus Tomentosus, and in English, the Cowan or Woolly Thistle.

II. The Kind. Among the many sorts Authors have given us of this Thistle, there are but four which are frequent with us, viz. 1. Acanthus Vulgar, I. Palure, 2. Acanthus Barbiatus, or Daureres, 3. Acanthus Erythrodes, Matthiolus, and Tabernan- tunum do all agree: Our Common Cotton, or Woolly Thistle 2. Acanthus Anglicus, Carduus Tomentosus 3. Acanthus Nigricans, Carduus Spherophaeus 4. Acanthus Diffierent. Carduus Tomentosus Capitale, Carduus Tomentosus Capitale minuturn, Carduus Tomentosus Capitale nigrere. Our English Cotton, or Woolly Thistle. 3. Carduus Tomentosus minuturn. Carduus Spherophaeus nigrere. 4. Carduus Tomen- tosus, Corona Frutrum Dollis.
Chap. 689. English Herbs.

**The Description.**

III. The fifth, or our Common Cotton, or Woolly Thistle. Its Root is great and thick, spreading much, but usually lying after Seed time. It has many large Leaves lying upon the Ground, somewhat cut in, and as it were cramped on the edges, of a green Colour on the upper side, covered over with a long hairy Wool, or Cottony Down, and not much more White or Hoary underneath, set with many sharp and cruel Prickles, from the middle of whose Heads of Flowers, come forth many Woolly Cotton Threads, (which are sometimes White, and very seldom,) The Seed which follows, lies in a great deal of fine white Down, being something large, long, and round, resembling the Seed of Sibbald’s, or Ladies-Thistle, but something smaller.

IV. The second, or our English Cotton, or Woolly Thistle, Its Root is great and thick, branched on the outside, and white within, and not unpleasant to the Taste. It has divers large and long Leaves, covered all over with a Cotton, Down, or soft Head, cut very deeply in on the edges, at certain distances, into several parts or Leaves, even almost to the middle Rib, making each Leaf from Winged, with joint and long Leaves on each side, and set in diverse places round with long and sharp Prickles. The Woolly Stalk rises up to the height of three, four, or five Feet, with few Leaves set thereon, and with but few branches, bearing at their tops, a large round hoary Head something flat, covered over as it were with fine Woolly Threads like unto a Net, not very Prickly, with many Purplish Threads in the middle, like unto those of the Attichokes, after which, come Thistle like Seeds, greater and rounder than those of the former.

V. The third, or Lesser Cotton, or Woolly Thistle. It has many white Woolly, or hoary long Leaves, much cut in on the edges into many parts, and each part also divided and set with small Prickles. The Stalk is not very great, cut much above two Feet high, but branched out towards the top, being white and Woolly soft, bearing on them small roundish Prickly Heads, having many Purple Threads rising out of their middles, and small Thistle like Seed after them.

VI. The fourth, or Our Cotton, Down, or Woolly Headed Thistle. It has a Stalk branched forth, on which grow Winged Prickly Leaves, which are large, long, and somewhat broad, thick set with sharp Prickles, but sparingly placed on the Stalk; as the tops of which, grow Spherical or round Heads, thick set, and hoary armed with long Prickles: out of the middle whereof, come forth Woolly Threads, which have a small fuzzy Smell. The Seed following, being enveloped in Down, is long, and Crinkled or Cornered.

VII. Gerard thus describes this last. It rises up with thick and long Stalks; the Leaves thereof are jagged, set with Prickles, and white on the under side. The Heads are round, and many in Number, covered with a soft Down and sharp Prickles Bending out round about them. The Flowers come forth of their middle, being a small of Purple Threads. The Seed is long and winding, like the Seed of some other Thistles.

VIII. The Places. The first Grows on Ditch and Bank-sides, and in Corn-Fields and High-ways, almost every where throughout our Land, and is also often
often found growing in Gardens. The second has been found growing in divers Barren Fields in Sommersetshire, as Label Eys, as also in several other places of England. The third is sometimes found growing in Gardens, as also in several other places, in dry and Sandy Ground. The fourth, however, in Gerard Eys, he found by Buckthorn, and in other places, in the Woods in Yorkshire and Mr. Goodger, found it also in Hampshire. Bondues Eys, was first to him under the Name of Cornus Arabica. Some say it is called Coroa Pratium, because it somewhat resembles the Heads of Bald Pined Frits.

IX. The Times. They all Flower and bear their Seed in June, or about the latter end of Summer, when other Thistles Flower and Seed.

X. The Qualities. The Root and Leaves are according to Galen, hot, and dry, about the end of the third Degree: They are Aperitive, Broody, Digestive, and Analtpick.

XI. The Specification. Authors say they Cure Cramps and Convulsions, and the Rickets in Children.

XII. The Preparations. You may have from the Roots and Leaves, 1. A Liquid Juice or Essence. 2. A Decoction in Wine or Water. 3. A Powder of the same.

The Virtues.

XIII. The Liquid Juice or Essence. Taken inwardly, from one Spoonful to three, in any proper Vehicle, Morning Noon and Night, it is said to cure the Cramps and Convulsions, especially that in the Neck, called Tetanus, in which the Neck cannot be Bifert or turned, without hurting the whole Body. It is good also against Cramps and Convulsions in other parts of the Body, likewise outwardly in small quantities, when taken inwardly as now directed, the parts affected be also very well Fomented or Bifed with the Essence thereof very hot, or with the Juice mixt with an equal quantity of Spirit of Wine. And to this effect (both inwardly and outwardly) it is said to cure the Rickets in Children, which is a Difaff that so vehemently confounds the Nerves and Ligaments of the Back and Joints, and indeed of the whole Body, that it hinders the Progression of the Nutritious, and so fructuates the Growing of the Child, diminishing its Height, Strength and Vigor.

XIV. The Decoction in Wine or Water, or Water mixt with Wine. If made strong, it has all the former Virtues, but as it is much weaker than the Preparations, so it must be given in much greater quantities, mixt from a Quarter to half a Pint, and that Morning, Noon and Night.

XV. The Powder. It is given for all the fame purpoftes, from half a Dram to a Dram, or Dram and half, in some proper Syrup, as Syrup of Elderberries, Syrup of Eelcompan, Roots, or the like, and that Morning and Night.

CHAP. DCXC.

OF THISTLE Carline.

I. THE Names. It is called in Greek, Της, by Theophrastus, and by Dioscorides by ἐνθέλοντος: in Latin, Cardina, and in English, the Carline Thistle.
Thistle Carline with a Stalk

Thistle Carline, Low Wild.

and of a doffy Green Color, and lying flat upon the Ground, but a little raised up from it, from among which at the latter end of Summer, comes forth a short Stalk, scarcely two inches long, bearing therein a large round febly and prickly head, with many bright purplish Threads rising out of its middle, which keep their Color a long time, after which, (they being past,) comes the Seed which is numerous, small, whitish, or of a Silver color, enclosed amongst the Down in the Head.

VI. Johnson in Gerard describes it after this manner. This Purple Carline Thistle, has a pretty large root, divided many times at the top, into several Branches, from which rise many green Leaves, lying spread upon the Ground, deeply cut in on the edges, and set with sharp Prickles. In the midst of these Leaves come sometimes but one, and sometimes more febly Heads, which carry a pretty large Flower, composed of many purple Threads, like those of Knapweed, but larger, and of a brighter Color. These Heads grow usually close to the Leaves, yet sometimes they stand upon Stalks 3 or 4 inches high. When the Flower is past, comes the Seed which is small and grumous, enclosed in the Down, all which are carried away with the Wind.

VII. The fourth, or the Wild Carline Thistle, or Wild Carline with a Stalk. Its Root is long and slender, with a tufting or fmall and bring Thistle. It rises up with a Stalk or Stalks, a foot and half, or two feet high, which are round and prickly, divided towards their tops into several Branches. From the bottom of the Root, come forth

Salmon's Herbal.

CHAP. DCXCI.

Of THISTLE Melancholy.

II. The Kinds. Authors make a great many sorts of this, but those only growing with, and most known to us, shall be here Described, which are the three following, viz. 1. Cirsium Anglicum primum; Cirsium Pattonicum primum, and Cirsium Butleri, Our Soft English Melancholy, or Soft Thistle. 2. Cirsium Anglicum alterum, Cirsium alius Anglicum, Cirsium Pattonicum alterum, Cirsium Butleri, Cirsium Britannicum secondum, Our other English Soft, or Melancholy Thistle. 3. Cirsium major latifolium, Cirsium primum Lappul窅i, Cirsium Verium Dodoni, Cirsium Latifolium Rubens: The Great Broad-Leaved, Soft or Melancholy Thistle.

The Descriptions.

III. The first, or our first English Soft, or Melancholy Thistle. Its Root has many long Strings coming from its Head or upper part, which is blackish, and persists not every Year. From which Root springs up a tender finge hoary green Stalk, having Thistle Melancholy English, First.

The Virtues.

XII. The Crude or Raw Root. Being chewed long in the Mouth, it attracts much cold Rheum, and does give ease in the Tooth-ach, and pains in the parts adjacent.

XV. The Precipitation in Wine. It has all the former Virtues, but as it is weaker, so it must be given from a Quarter to half a Pint or more, Morning and Night, and so to be continued for some considerable time.

thereon four or five green hoary Leaves, botched about the edges; the points whereof are little or nothing prickly: and at the top usually but one head,
head, yet sometimes from the bown of the uppermost leaf, there comes forth another smaller head, which is fealy, and something prickly, with many reddish purple threads or thorns in the middle, which being gathered fresh, will keep their color a long time, and standing on the stalk, will not fade in a long season; after which it perfects its seed, which is of a mean proportion for signity, embossed in its down.

IV. The second, or our other English soft, or Melancholy Thistle. Its root at its head is somewhat tuberous, and blackish on the cut-sid, containing several long fibers or strings, which run under the earth here and there, and send forth new heads for increase. From this head spring up long, narrow hairy leaves, set about the edges with slender prickles, not much unlike the former, but more hoary underneath, and more green above. From the midst of these leaves grows up a stalk, a root, or root and half, or two feet high, which is tender, stiff and downy; upon which grow leaves larger than those below, which are something broad at the bottom, and threelf a little midst, middle, or cut. This stalk sometimes is single, without any branches, and sometimes it has one or two, or three long slender ones. Out of each of the tops of which stalk and branches, grows one large leafy head, with many purple threads in the middle, as much unlike the common knapweed, which at length, thistle like, turn into downs, in which the small thistle thistle like seed is embossed.

V. The third, or great broad leaved, soft, or melancholy thistle. Its root is small and long, with several fibers attached thereto. Its leaves are large and long, as large as those of bugleweed,

**Thistle Melancholy Great.**

Heads are increase. From this head spring up long, narrow hoary leaves, set about the edges with slender prickles, not much unlike the former, but more hoary underneath, and more green above. From the midst of these leaves grows up a stalk, a root, or root and half, or two feet high, which is tender, stiff and downy; upon which grow leaves larger than those below, which are something broad at the bottom, and threelf a little midst, middle, or cut. This stalk sometimes is single, without any branches, and sometimes it has one or two, or three long slender ones. Out of each of the tops of which stalk and branches, grows one large leafy head, with many purple threads in the middle, as much unlike the common knapweed, which at length, thistle like, turn into downs, in which the small thistle thistle like seed is embossed.

VI. The places. The first and second grow in mossy meadows in many places of England, both in the southern and northern parts of our island. Chaucer found them growing in Hungary, and in the mountainous meadows a long the side of the Danube in Austria, our poets found them growing in the meadows at the foot of Ingleburn-Hill in Yorkshire, Lobe in the meadows at Alton, in Gloucestershire; and John for says, that he once found the second in a meadow between Highgate and London. The third grows in the fields on the mountains in Germany, and John for says it grows wild upon the sea-coasts of Holland, Belgium, and Zealand, and an English gentleman told me he had found it in some meadows on the front of some mountains in North Wales, as also in some other parts of the Kingdom.

VII. The times. They flower in June, July and August, and their seed is ripe in some short time after.

VIII. The qualities. They are hot and dry in the end of the first degree, aperitive, alliterive, a little altrimient, splendidick, nepthicrick, hyttie- rick, and sudorifick.
The Virtues.

X. The Juice or Essence. They potent parts open all the Viscera, but it is the most strong in Operation, and therefore is to be given from a Quarter to half a Pint at the times afterdined. If a good Draught of it be given to any without retiring, for some considerable Substance, it cures the Jaundice, or Night-Mare, as has been several times proved by Experience.

XIII. The Spirituall Tinctures. Taken from half a Spoonful to a Spoonful, or more in a Glass of Wine, it is not only good against all Disorders before specified, but is a good Cordial against Sickness at Heart, Painting and Sweating Fits. Vapors, and withall makes the Patient Chearful and Merry, wonderfully exhilarating the Spirits.

XIV. The Acid Tincture. It opens Obstructions, repelles Vapors, strengthens a weak Stomach, and provokes Urine. Dose to many Drops in a Glass of Ale or Wine, as to give it a pleasing Aciity. It may be taken several times in the day, twice as often as the Patient drinks.

XV. The Oily Tincture. It is singular against the Complaints, provokes Urine strongly, calms the Stomach, and gives wonderful relief in the most profound Melancholy. It has all the Virtues of the Juice and Essence, but ought not to be given to such as are of a very hot Constitution, unless by a Skillfull Hand. It is good against Convulsions and Palsy in old Habits of Body, potently provokes the Terms, eases the Reins and Womb, cause Conception, and at time of Travel and Deliverty. Dose from 10 to 20 or 30 Drops, which may be dropped into Sugar, and then mixt with a Glass of Canary, white Lisbon, or any other Vehicle the Physician shall most approve of, and to drink up.

CHAP. DCXCII.

OF THISTLE Milky: or, Ladies Thistle.

THE Name. It is supposed to be that which the Arabs call Bedeguar; called in Greek, Sipham; and in Latin, Silybum, Cardu-um tenui, Carduus Maria, & Scalae Murae, in English, The Milky Thistle, and Ladies Thistle.

We have but two special sorts of this with us, viz., 1. Carduus Mariae, or Carduus Carduus, Cardans Argento- nus, Carduus Mariae Trigl. Lacerata, Vulpian, Gosseni, & Camerarij, Carduus Marianus Cordi & Tuberamontus, Carduus Lumpsqualus Dode- neti, who with Locana, Marathus, Cornarius, Vulpianus and Lagoquarix, took it to be the Leuropo- graphis Phyllis, Silybum Angulare, & Scalae, Carduus Sycoceus atmodgenus Celaphini, Our Common Ladies Thistle, or Milky Thistle. 2. Silybum marianum, Carduus Lumpsqualus, & Scalae, Sipham, Scalae, Leucocentha, The white Thorn Thistle.

The Descriptions.

I. The kind, or Our Common Ladies Thistle, or Milky Thistle. Its root is great, spreading in the Ground, with many Strongs and small Fibres fastened to them, from whence rise up many large and very broad Leaves lying on the Ground, cut in, and as it were crumpled, but somewhat hairy on the edger, and of a white green shining color, wherein are many Lanes, Strokes or Veins, of a Milky color, running all over the Leaf, some very small, some larger, and other some very large: These Leaves are set with many sharp and stiff Prickles all about, among which rise up one, and sometimes more Stalks or Staths, round and full of Prickles, set full of the like Leaves up to the Tops, where at the end of every Branch, comes forth a great prickly Thistle head, strongly armed with Prickles, which contain in their middle bright Purple Vivers or Threads, which being pulled away, there follows the Seed, which
Thistle White Thorn.

as that, but is overgrown with a green bristly or Down upon it, though which runs some whitish Veins, almost of a Cream color, but nothing so numerous, nor so large, nor yet so white as the first. From the middle of these Leaves rises up a pretty strong, hard, prickly Stalk, of about 2 or 3 feet high, with some few Branches towards its top, as the tops of which grow pretty large, Thistle like heads, with a purple Thorn in the middle, after which come Thistle like Seed, enveloped in a great quantity of fine, white, soft Down.

V. The Places. They both grow almost every where in England; the first on almost every Ditch and Bank Edge, and in waste Fields almost every where. The other grows also in waste and unfitted Grounds, and in many places where the other grows, and sometimes in Fallow Fields, also among Corn, and many times by High-ways Sides, and the Borders of Meadows.

VI. The Time. They Flower and Seed in June, July and August, when other Thistles do, and their Seed is generally ripe the next Month following, being their time of Flowering.

VII. The Qualities. The Milky Thistle is hot and dry in the first Degree, Aperient, Alleviating, Stomatiac, Sedative, and Allopharmic.

VIII. The Specification. It is used for the Cure of Agues and Fevers, both Malign and Pestilential, to open Obstructions of the Stomach, Lungs, Liver and Spleen, and other Difices of the Heads and Glands, provokes Urine, help the Jaundice and Droptick, and give ease in the Strangury, Dysentery, Stone, gravel, and other Difices of the Reines and Bladders: It is also good against Palpitation of the Heart, and other Palpations of the Guts.

IX. The Preparations. You may make therefrom, 1. A Liquid Juice or Essence. 2. A Decoction of the Herb, Roots and Heads. 3. A Powder of the Seed. 4. A Distilled Water. 5. A Salver of the young Stalks.

The Virtues.

X. The Juice or Essence. They are thought to be as effectual as Carduus Benedictus, for all the same purposes, viz. for Agues, Inflamations Difices, Malign and Pestilential Fevers, and the Inflamation of the Plague, both to prevent and cure it. They open Obstructions of the Stomach, Liver, Spleen, Reins and Womb; which are against Hypochondriack Melancholy, Scaveny, Droptick, Jaundice and Goar: These safe pills in the Sides, Sultices, and are profitable against the Colick and Grippings of the Guts. Dole from 2 to 4 Spoonfuels, Morning and Night, in a Glass of Mol'd Canary.

XI. The Decoction in Water or Pota-Drick. It has all the other Virtues before specified, but must be given to half a Pint or more, Morning and Night, mixed with a little Mol'd Canary, or White Port Wine.

XII. The Powder of the Seed. It may be given to a Dram Morning and Night, in any convenient Vehicle. It is said to be as good, if not more powerful for the Cure or help of all the before-mentioned Diseases.

XIII. The Distilled Water. It is good against all inward Fevers and the like, to allay the heat and Inflammation of the Stomach, Liver, Spleen, Reins and Womb; and besides is often applied outwardly with Cloths or Spunges, to the Regions of the Liver and Heart, to cool the hot Distempers of those parts, and to relieve Fainting and Soothing Fits.

XIV. The Salver. It is made of the young Stalks peeled and dried, as the Stalks of other Chardons and Wild Artichokes are, which being eaten, are said to increas Milk in Nursers Breasts.

CHAP. DCXIII.

OF THISTLE Star.

I. The Name. It is without doubt the Monagbo Theobrasbul, lib. 6. cap. 4. In Latin it is called Carduus Stellatus, and Carduus Stellarius, in English, the Star Thistle.

II. The Kind. The most usual sorts of this Plant with us are only two, viz. 1. Carduus Stel-}
Salmon's Herbal. Lib. 1.

The Descriptions.

III. The first, or our Common Star Thistle, has a Root which is small, long, woody, and perishing every Year, the Plant raising it self every Spring from the Seed of its own Sowing. It has diverse long and narrow Leaves lying on unto the Ground, cut or torn in on the edges very deeply, into many almost even parts, soft, or a little woolly all over the green, which is a little whitish, from among

Thistle Star Common.

which rise up several weak Stalks, forced out into main Branches, all lying, or leaning down towards the ground, rather than much raised up, so that it forms a pretty Bush set with divers the like divided Leaves up to their tops, on which is found long and firm white or green Heads, set with very sharp and long sharp Prickles, as part of the Plant being in every part or part there prickly hedges. These Prickles are of a whitish yellow, and sharp as in any other Thistle. Out of the middle of the Head comes the Flower, composed of many small reddish or yellow or yellowish green Heads, after which in the Seed Head lies the Seed, which is small, whitish and round, enveloped in a thin pale Brown.

IV. The second, or white Flowered Star Thistle, its Root is long and brown without, from whence rising up many soft white or fringed Leaves, deeply cut or jagged on the edges, wholly without Prickles, among which rise up a Stalk dividing it self into many Branches, and growing about two feet high, on the tops whereof are small Thistle like heads, armed round about with many sharp Prickles, not much unlike to a large sparkling Star. The Flowers are of a white color, and the Seed is small and flatish round. In a word, there is little or no difference in the form of this from the former, but in the white greenness of the Leaves, and the white threaded Flowers.

V. The Places. They are said to grow on waste and barren places, near Cities and Towns, almost everywhere: The first has been found in many parts about Midland Green near London. The other is much more rare, not being so common to be met withall.

VI. The Times. They Flourish and Flower in June and July, and their Seed is ripe in July and August.

VII. The Qualities. It is hot and dry in the first Degree, Aperitive, Diuretic, Stomutick, and Nepctick.

VIII. The Specification. It is used for the Cure of the Strangury, Gravel and Stone in Reins or Bladder, Fillula's, French Fever, Oldrath of the Stomach, Liver, Spleen, Reins and Womb, Aegus, the Plague, and all sorts of Pestilential Diseases.

IX. The Preparations. You may make therefrom, 1. A Liquid Juice or Essence of the whole Plant. 2. A Powder of the Seed. 3. A Powder of the Root. 4. A Distilled Water from the whole Plant.

The Virtues.

X. The Juice or Essence. Drunk from 2 to 4 Spoonsfulls in a Glass of white Port, or Lisbon Wine, it eases all Obstructions of the Viscera, clears the Stomach, Womb, Reins and Bladder, gives relief
Chap. 694.  English Herbs.

In the Strangury, provokes Urine, helps to break gritty Stones, and to expel them. It prevails powerfully against the French Pox, induces the Cure of Thistle's, is profitable against the Plague, and all Pestilential Disalties, and Cures Quoquidian and Tertian Agues.

XI. The Powder of the Seed. Given to a Dose of the Seed and half, Morning and Evening, in white Port, or Lisbon, or Sherry Wines, either raw or Mulled, it gives Cape in the Strangury, provokes Urine, and is profitable against Gravel, Stone and Tartarous Muclage, whether in the Reins or Bladder.

XII. The Powder of the Root. It may be taken, from one Dose to two in Mulled Sack, Morning and Night, against the Plague or Pestilence, and all sorts of malady and Pestilential Diseases, and so taken also for some time, it is said to induce the Cure of Thistle's in any part of the Body.

XIII. The Distilled Water. Baptista Sardana comments it (being drunk) against the French Pox, to open Obstructions of Liver and Spleen, cleanse the Blood, and to cure Quotidian and Tertian Agues. If these are the Virtues of the Distilled Water, I am sure the Juice or Essence aforesaid, will perform the same things much more powerfully.

CHAP. DCXCIV.

Of THISTLE Hartzickoak-like.

I. THE Name. It is said to be the Bythistle, Doisardus in Lattine, Scolopia Carduan, Cardaus Carduae, Cardaus Carduarum acutatus: in English, The Hartzickoak-like Thistle.

II. The Kinds. It is singularis sui generis, a true Thistle like Plant, its Leaves being armed with Prickles as most other Thistles are.

Thistle Hartzickoak-like.

The Description.

III. As its Root is great, so it spreads much, and springs forth out of the Earth with several large hard narrow Leaves, which as they are irregularly and irregularly incised and jagged on the side, so are they at every corner of those edges, armed with stiff and sharp prickers, as other Thistles generally are. These Leaves which if they upon the Stalk, encompass the same, and are of a dark green color. It sends up sometimes but one Stalk, and sometimes two or more, at the top of which that comes forth a Thistle-like spiny prickly Head, flatter than those of the Carduae, which are kept to be eaten, which is also armed with stiff sharp prickers, from the middle of this Head comes forth the purplish Cyanion Thruel, or heap of Threads, which after some time puts away, and the Seed remains in the Heads being flat, and like other Thistle-Seed, enveloped in Sack.

IV. The Flowers. It grows wild in many Southern Countries, as about Mompelier in France, but with us it is only to be found in our Gardens.

V. The Times. It Flowers in the end of Summer, and the Seed is ripe in about 4 or 5 Weeks after.

VI. The Qualities. It is hot and dry in the first Degree, Aperient, Alfringent and Diuretic.

VII. The Specifcations. It has the general property of most other Thistles, viz. to remedy the Stinking Savour of the Arm-Pus, and indeed of the whole Body, and to expel strong and stinking Urine, thereby cleansing the Reins and Bladder of Filth, and mucilaginous Reckemins lodged in those parts.

VIII. The Preparations. The Decotion of the Roots or Heads, or both in Water or Wine, is that which is chiefly used Medically.

The Virtues.

IX. The Decotion aforesaid. Made with Water or Wine, or half Water half Wine, being taken Morning and Evening to half a Pint or more, swarmed with double roasted Sugar, provokes Urine after a singular manner; and by the Included gases carries off all the stinking or stinking Reckemins of the Blood and Humors, which cause the Arm-Pus and whole Body to have an ill Smell; and whilst cleanses the Reins and Bladder of Gravel, Sand, and Tartarous matter lodged in those parts.

CHAP. DCXCIV.

Of THROUGH-WAX:

I. The Name. Since no Greek nor Ancient Latin Authors have wrote of this Plant, we can give you no Names from them. Our modern Authors do generally call it, Perfoliatum, and Perfoliatum. In English, Through-Leaf, and Through-Wax.
Salmon's Herbal. Lib. 1.

II. The Kinds. We have an account of ten or twelve sorts of this Plant, but most of them being Strangers to us, we shall only take notice of such as are to be met with in Great-Britain, which are the three following, viz. 1. Perfoliata vulgaris. Our Common Through-Leaf. 2. Perfoliata flore multiplex, Perfoliata longifolia Dalechampiana in Lundinaria, Double Flowered Through-Wax, or Through-Leaf. 3. Perfoliata angustifolia vulgaris, Perfoliata angustifolia Lobelia, Commonly, Gefantar, Tabernamontani, &c. Tragia, Perfoliata Napifolia Lobelia, because as he says, it partakes of the Navew; and therefore some have called it allo flavae campestris, Sibarifia et Agrobia biliqua, or Perfoliata: Our Common Codded Through-Wax, or Through-Leaf.

The Descriptions.

III. The first, or our Common Through-Leaf, has a Root which is small, long and lignous, perishing every year after Seed-time, and rising plentifully of its own Sowing the Spring following. It sends forth one straight round Stalk, and sometimes more, two Feet or more high, whose lower Leaves being of a bluish green Color, are smaller and narrower than those up higher, and do stand close therto, not encompassing it, but as they grow higher, they do more and more encompass the Stalk they spring from, until it wholly (as it were)ğiye therto them, branching towards the top into many parts, where the Leaves grow smaller again, every one standing singly, and never two at any joint. The Flowers are very small and yellow, standing in Tufts at the heads of the Branches, where the hoodie leaves would almost cover the Seed, which is small and blackish, very thick together.

Through-Leaf Codded.

IV. The second, or Double Flowered Through-Leaf. This differs in nothing from the former, but in the Heads of Flowers, which are thicker set together, and larger, but give no Seed, being wholly a degenerate Species, rising from the Seed of the former, spreading its Strength and Increase in its plentiful Heads of Flowers.

V. The third, or our Common Codded Through-Leaf. Its Root is small and woody, perishing after Seed-time, which sends up many Stalks, spreading themselves out at every Joint, with Leaves set at them, encompassing them at the bottom,very like unto the first Common Through-Wax, but thicker, fatter, and longer pointed, and of a whiter green Color, most like unto Cabbage or Colewort Leaves, and usuall with an unevenness on the edges. The tops of the Branches are furnished with many small white Flowers, standing one above another, confini...
The Virtues.

XII. The Liquid Juice or Essence. Either of them may be given inwardly from 2 to 4 Spoonfuls in 1/2 or 1 Pint Wine, or Barbur Wine Melt, Morning and Night, for inward Wounds or Bruises, or inward Ulcers in the Lungs, Rein, Bladder or Womb; as also for Ruptures whether of the Navel, Teffelles or Groin, and the parts inwardly affected may be washed and fomented with the same, to induce a speedy Cure, whether in Old or Young.

XIII. The Confection in Water or Wine. It has the same Effects, but is much weaker, and may be used in the same manner: When taken inwardly, it may be given to half a Pint or more at a time.

XIV. The Powder of the Leaves. It has the force of the Juice or Essence, being given to a Diam or more at a time Morning and Evening, so long as need shall require. Outwardly applied upon old, purrid and running Ulcers, it cleans them, has an incarnate force, dries, and quickly heals them.

XV. The Oil or Ointment, made of the green Herb. It is good to ease Pain, repels a Flux of Humours to any part, to cleanse and dry old Ulcers, and specically to heal up green Wounds, being Proficiently applied.

XVI. The Cataplasy. Applied outwardly, it has the same Force and Virtues with the former Preparations, it dissolves simple and recent Contusions, but is of principal use for the cure of Ruptures in Children, before they grow too old.

THREE-FACES in a Hood, see Hearts-Ease, Chap. 646, 947.
THREE-LEAVED GRASS, see Teefold, Chap. 701.
THISTLE, see Pink, Chap. 564, Sect. 18, 19, 228.
The Descriptions.

III. The fifth, or leafier Throat-Wort or Canterbury-Bells. Its Root is hard and white, spreading it fall out into many Branches under Ground, not pervading every Year (tho' it lodges all its Leaves in Winter) but dashing many Years, and increasing into several Heads, or Bells, from whence spring up new Leaves and Branches. It has many large and rough Leaves, something like unto Nettle Leaves, being broad and round at the bottom, and pointed at the end, and rather too thick on the edges, every one standing on a large stalk. From among these Leaves rise up divaricate square upright Stalks, divided at the top into several Branches, on which grows the like Leaves at the bottom, but thicker towards the ends of the Branches, and the Flowers intermixed with some longer Heads, every one in its several blast, which are both long and round, like a Bell or Cup, made open at the Mouth, and cut at the Stem into five Corners or Disjunctions, somewhat taller than the Coventry Bells, in Chap. LXIV. Selv. V. oragoems; which in some Places are of a pure white, in some whiteness, and in others of a fair, deep Purple color, and in other some paler. After the Flowers are fall, some smaller and rounder Heads thun in the Coventry-Bells, containing but Seed, but blossoms, and not so red as these.

V. The third, or greater Throat-Wort, or Canterbury-Bells. Its Root is like the last foregoing, not differing in any thing therefrom, but in the dexterity of its Flowers; and there is of both white, and Purple Bells, a bulb like the Seed Speaker, which bear double white Flowers, and double Purple or White.

VI. The fourth, or greater Dutch Throat-Wort. Its Root is very large, spreading under Ground, and has many fibres adjoining. It rises up with several Branches or Stalks, which are tall, great and bony, with several Leaves set thereon at distances, sometimes long, and sometimes two together upon short stalks, which are pretty long, broadish at the bottom, and green growing gradually to a Jove Point, and are matched like a Scon on the edges, not much unlike those of the greater Throat-Wort at Selv. IV. above, seeing that these are much greater both in the Leaves and Stalks. The Flowers are of a Purplish brown color, and almost as large as those of the Coventry-Bells. In all other particulars it agrees with the former greater kind.

VII. The fifth, or Giants Throat-Wort, or Canterbury-Bells. Its Root is very great, thick and white, sometimes branching in, but shooting many Stems. Though it has a Gigantio Name, yet fearlessly ever greater than the second sort foregoing. Its Leaves are not so rough, but as large, and divided about the edges, somewhat larger pointed, and of a frequent green color. The Stalks bear much like Leaves on them, more thinly or differently set, having a Flower at the bottom of every Leaf, from the middle upwards, being somewhat like the great Throat-Wort in Form, but of a pale or flesh reddish purple color, turning their Buds or Corners a little backward, with a forked Clapper in the middle, which is eminently yellow. The Seed is white, and plentiful in the Heads, which will abide all the Winter upon the Stalks, until all the flowers being shed, the Heads remain ing firm like round Raisins, or thin pieces of Skin eaten with Worms. There is another of this Species, but it differs in nothing from this, nor Differed, but in its Flowers, which is White.

VIII. The sixth, or late Flowering Throat-Wort, or Canterbury Bells. Its Root is thick and bony, its Stalks are divided between a dark and green, and pretty flat in bending, broad or oblong ding, and at the top, sharp at the point, unevenly round or matched about the edges. The Stalk rises up to be about a foot high, being soft, and almost wholly like the Leaves, spreading out into five or six Branches at the top, with many Self-Imbued Flowers, like the half greater sort (at Selv. IV.) but smaller, and of a pale bluish or purplish Alb color, which by reason of their late Florishing, are called Alba.

IX. The seventh, or rich Crimson Throat-Wort of America, or Cardinals Flower. This Brave Plant has a white Root, which spreads it self divers ways under Ground, having many long green Leaves, which are spread round about the head thereof, each of which is something broad and long, pointed at the end, and finely jointed about the edges. From the Middle of the Head, two trees high at least, bofed with divers dark-brown Leaves as grow below, but longer below than above, and spreading it self out at top abundantly, every Branch bearing a Head of Flowers, and one at the foot of every one of them also, the top colour of the do end in a very large Taft of Flowers, with a small green Leaf at the foot of the Stalk of every Flower, and very green, and one inch long, bearing a round green back, divided into five longer Leaves, or Points turned downwards; and in the midst of every one of them, a small rich Crimson coloured Flower, ending in a foot long narrow Leaves, standing all of them fire-right, but set at their back, with a long Umbel or Pointle, set as it were at their back, bigger below, and smaller above, with a small Head on top, being of a little paler color than the Flower, being, as it were, a perfect color admirable only for the great a Bight of Orient red Crimson Flowers. The Seed is inclosed in small Heads, within these green Buds, which hold the Flowers, which is very like to the Seed Veilus of the Coventry-Bells, and is small, and of a brownish color.

X. The Places. The fifth has been found growing in the Meadow next unto Potters Ferry, as you go to Westminster, upon the Chalk in Kent, near Derham, and a Green-bath in Kent, and in a Field by the Highway, growing from thence to Dorset, in Henningham Park in Essex, and in same Meadow next Rambourne, not far from London. The second grows plentifully in Woods and Hedge rows in Kent, about Canterbury, Sittingbourne, Greavesand, Southwell and Greavesand, especially under Cobham Park Hall, leading from the Park not far from Greavesand, and in mead Places about Watford and Bury, and parts adjacent to them. The third grows in Gardens. The fourth grows plentifully in Gardens, and several parts of England. The fifth grows plentifully upon the Banks of the River Tay in Scotland, and other places. The sixth sometimes Wild, but mostly in Gardens. The seventh grows near the River Sover, and in all the small Gardens, and other parts of America, but in a wood, all these several Species are found up in many of our Gardens here in Great-Britain.
Chap. 697. English Herbs.

XI. The Times. They flower from May to the end of July or August, the Seed ripening in the same month.

XII. The Qualities. They are cold and dry in the first Degree, Abstringent, Astringent, and Vomitory.

XIII. The Specification. Throat and Nose curés Inflammations. Throat, Throat, Mouth, and Tongue, expel the Secret parts of Man or Woman.

XIV. The Preparations. You may make therefrom 1. A Liquid Juice or Essence. 2. A Decoction in Water or Wine.

The Virtues.

XV. The Liquid Juice or Essence. They are Astringent, and found to be efficient to gargle and wash the Mouth and Throat, where any Tumor, or Inflammation of the Tongue, Ulcers, Throat, Mouth, Gums, as also Wounds, Sores or Ulcers in those parts, being gargled withal warm, or Syringed into the Throat, so in like manner it is appropriated to running Sore or Ulcers in the Neck, Secret parts of Man or Woman; whether outward or inward, being often used therewith, if outward, or injected in with a proper Yard or Wound Syringe, they wonderfully cleanse, dry, and heal them: But if the Sores or Ulcers are not yet or never had, it will be good to add an inch part of Spirit of Wine thereunto, and sweeten the fame with Honey, and towards the conclusion, to every Pint of the Liquid, to add an Ounce or six Drums of Rook Alum in fine Powder.

XVI. The Decoction in Water or Wine, or in half Water half Wine. If it is made strong, it has all the same Virtues, being used in like manner with Spirit of Wine, Honey and Alum, and is applied as a Gargarium, or as an Lotion, or as an Injection with a proper Syringe, and it performs the like in old running Sores or Ulcers in the Neck, or any other part of the Body, and by its faculty of drying and binding, it restrains the Flux of thorp humours to any Ulcer, Sore or part, which freezing the place, keeps it from healing: it heals also simple green Wounds, conglutinating their Lips after an excellent manner.

CHAP. DCXCVII.

Of THYME, Vulgarly called THYME—Garden.

I. The Name. The Arabians call it Hafn: in Greek it is called Θυμός (θυμός), quod ipsi son animi deliquium patiuntur affidavitis, in Latin, Thymus and Thymium: in English Thyme, and Time.

II. The Kinds. The chief or principal Kinds are two, viz. 1. Thymus Hortensis, Garden Thyme, of which in this Chapter. 2. Thymus Sylvestris, Serpyllum, Wild Thyme, or Mother Thyme, of which in Chap. 698, next following.

III. The Species of the Garden Kind. They are chiefly three, viz. 1. Thymus Hortensis, Thymum Largement, Thymum, Thymus, Serpyllum, Wild Thyme, or Mother Thyme, of which in Chap. 698, next following.

The Descriptions.

IV. The first, or our Garden Thyme, has a fresh

by, thorny, woody Root, which will live hard many Winters, if they be not too vehement or fiercely cold, and the Plant is not grown too great or woody, which will also cause it to perish or dry. It is a small low thorny or woody Plant, with brittle

Thyme Garden, common.

Branches, and small hard green Leaves on them, with small white purplish Flowers, and some Leaves among them, standing in slender round about the Stalks, after which comes the Seed, which is small, and browner than that of Marjoram. The whole Plant is of an exceeding Aromatic and sweet Smell, very acute and pleasing to the Senses.

There's a Defect in the Case of this Species, for here it is represented like Thyme cut off or crop, the Graver having cut off the Tops, or left out its ruffles of Flowers and Seeds. This kind is for the most part propagated by Slips, set in the Spring-time, after the very cold Weather is past.

V. The second, or true Thyme of the Ancients, Its Root is woody, pretty long, (refined being had of the Magnitude of the Plant) and slender, with many Fibres adhering to it. It is a threycnder Plant, having hard and hony brittle Branches, spreading out from a small woody Stem, nearly a foot high, on which grow at several Points, many small, fibrous or hony green Leaves, of a quick Aromatic sweet Smell and Taste. At the tips of the Branches stand small white green Heads, somewhat like as the Heads of Stocchus, which are made up as it were of many Leaves or Scales; out of which come forth small purplish Flowers, not having any manifest Seed, as Theophrastus and some of the other

Ancient
Thyme true of Dioscorides.

It grows not so high, its leaves are longer or longer, and withal whiter, or a little hoary, and a little more thickly or disfavourly set: its little more smaller, but its flowers and seeds grow in bundles towards the tops like that, and not unlike them for form; but more acute or quick in its smell and taste, than our Common Garden Thyme.

VII. The fourth, or Limon Thyme. It is a tender but Noble Plant, nor much differing in its root, stalks, branches, leaves, form and colour of growing, from our Common Thyme, saving that it grows more upright, lasting or spreading it self out thick with branches. The leaves are small, and of a green color, which with seeds or bundles of flowers and seed, have the perfect Smell of a Citron or Limon, but more acute and Aromatic and the flowers are also whiter than those of the Common sort.

VIII. The fifth, or Mallich Thyme. Its root is woody, fibrous and perennial. It grows not so upright as the former kinds, but rather more or spreads upon the ground with small branches, but many more in number, and nothing more so woody, the leaves also are not so hard, but softer and broader. The flowers grow in bundles at the tops of the stalks and branches of a purple shade color, like those of the first and third sorts foregoing; this better endures the winter, and longer, but gives no seed with us, and is therefore propagated by Sowing. It has an Aromatic, Gloriferous pleasant Smell and Taste, yet secretly so quick as the Common Kind.

IX. The Places. The second grows plentifully about Seville in Spain, (where they know no other Thyme) as also in Italy, Spain, Cadiz, and parts of Greece; but that, with all the rest, are Nurt up with us in Gardens. The fourth kind Gerard says, he found growing Wild in a Barren Field, at Southfleet in Kent, but it is truly with us a Garden Plant, yet it is found in many places in Kent, between Southfleet and Longfield-Downe, and between Rothferry and Sittingbourne, even in the High-way, where, by its very Smell, it may be known from the Common.

X. The Times. They Flower with us about the latter end of June, and third all July, but the second Spanish Flowers later, viz. scarcely till August.

XI. The Qualities. They are hot and dry in the third Degree at least, Aperitive, Abstensive, Althentic, Diuretic, Stomachick, Cephalick, Neutrick, Pyrettick, Nephitick, Aplasmatic, and Emmencopieck.

XII. The Specification. Thyme is used chiefly for Dileases of the Head, Brain and Nerues, as Leuky, Verigo, Spleen, Consolations, Applessy, Allo for Sickness at Heart or Stomach, Paintings, Swooning, Palpitation of the Heart, Obstructions of the Lungs, and the Strangury. It provokes the Temps in Women, expels both Birth and After birth, and helps such as are dull Sighted, and have a bad Memory.

The Virtues.

XIV. The Liquide Juice. Baked upon Wains it takes them away; it distillles cold Tumors, and eases
Chap. 697. English Herbs.

causes Pains in any part proceeding from a cold Cause, but applied to the Place: And should the Nollects of an Erhni, it purges the Head and Brain of cold pititious Humors which cause Apoplexies, Leathgeries, Vertigo's, Palfies, dullness of Sight, weakness of the Memory, Head-aches, Megrim, &c.

XV. The Efficace. Given from one Spoonful to two Spoonfuls or more, in the Distilled Water, or other proper Vehicle, it causes an evacuation of Flegm (so also it is taken with Honey, Salt and Vinegar.) It is good for the Spleen, scorbutic, and different kinds of Ulcers in the Belly, provokes Urine and the Terms, facilitates both Birth and After-birth, expels the dead Child; and being bathed upon recent Tumors, it diffuses them.

XVI. The Decinm in Water or Wine, or in a mixture of both. It has the Virtues of the Efficace foregoing, but as it has not the same strength, so it ought to be given in a much larger quantity, as to bale a Part at a time, more or less; it helps such as are dull Sightedit, have a bad Memory, and an ill Digestion, because it warms, comfortes, and strengthens the Tone thereof.

XVII. The Decinm Oil. It is Anodyne, cures all Aches and Pains in any part, as also painful Tumors, Gout, &c. arising from cold and moist Causes, being bathed Morning and Night upon the parts affected before the Fire: It cures gripping Pains in the Belly, pains of the Spleen, and is very effectual in curing the Croup.

XVIII. The Powder of the Leaves and Herbs. Used as an Erhni, it cleanses the Head and Brain of cold and moist Rectiments, which are the causes of many Diseases. It is of good use in Meats and Broths, to warm and comfort a cold and moist Stomach, to help Digestion, and expel Wind. If given to three Drams (I should think two Drams to be enough) in Oyster water, it is fit to purge Choler and other sharp Humors, and help such as have the Gout, and is profitable for such as have an Apoplexy, Falling-Sickness or Leathernity. Given to a Dram, or Dram and half every Morning falling in Meat, or Oyster, brings down a great Belly, and takes away the hardness thereof. It is good against the swelling and pain of the Spleen, pains in the Knees and Hips; cures pains in the Eyes and helps such as are Blind-Eyed. Given to two Drams in White Port or Lisbon Wine, it provokes Urine, gives safety in the Strangury, and expels Sand, Gravel, and Tartarous Slime in the Ren and Bladder: Mix with a double or triple quantity of Honey, and given in anointed Wine, it is comfortable to the Head and Stomach, expells Wind, cures the Strangury, and helps a dry Cough.

XIX. The Capsule. The Leaves beaten into a pulp in a Stone of Brash Mortar, adding a sufficient quantity of the Liquor Juice, and brought to a Concoction with Bein or Wheat-Flower, or white Breads, cures the pain, and diffuses the Tumors in the Cods which are much troubled or inflamed: So also applied to the Forehead and Temples, it cures the Megrim, Head-ache, and helps other Difficulties of that part.

XX. The Distilled Water. It has the Virtues of Juice and Efficace, but much weaker: Mixed with Vinegar of Rifes, and applied as an Ephetum to the Forehead and Temples, it is fit to ease the raging pain of the Head-ache and Megrim; help against the Vertigo, and share the raging in Frenzy and Delirium. Given inwardly to 4 or 6 Ounces, with 40 or 60 Drops of Oleum Tartari per deliquium, it is fit to break the Stone in the Bladder, at least it potently clears the Urinary parts of Sand, Gravel and Tartarous Mucilaginoid in their Parts.

XXI. The Spirit. Given to a Spoonful or more, at a time, either alone well diluted with Sugar, or Syrup of Cangifificiums, or in a Glass of generous Canary, it very much comforts the Stomach, warms and strengthens it, is good against palpitation of the Heart, Sicknes at Heart, Fainting and Sweating Fits, and other difficulties of the middle Viscerel.

XXII. The Distilled Oil. It is of excellent use for all cold and moist Difficulties of the Head, Brain and Neaves; and therefore is a most potent thing against Convulsions, Cramps, Apoplexies, Epilepsies, Vertigo's, Leathgeries, Palfies and Agues. Dose from 4 Drops to 10, according to age and the exigency of the Difficult, being droped into fine Sugar, and then mixed with some proper Vehicle to swallow it down.

XXIII. The Petroleum or Puffers. They have all the Virtues of the Efficace, Oil and Spirit, are very useful, and penetrate more than either of them; (and in my Opinion) are better to be given in Vertigo's, Leathgeries, Convulsions, Apoplexies, Epilepsies, Palfies, Gout, &c. and much more effectual than the Efficace or Spirit, and more fit than the Oil for outward applications. Dose from 10 to 60 Drops or more in Canary, or any other convenient Vehicle Morning and Night, to be used with a Controversial, so long as the necessity of the Difficult shall require.

XXIV. The Spirituosum Tincture. It is Cephalic, Neurotic, Stomachick and Hysterick, good against all the cold and moist affections of those parts; warming, comforting and strengthening them, and restoring their Tone when prejudicated or hurt. Dose from 20 to 50 Drops in Wine, or some other fit Vehicle, which may well agree with the Stomach of the Patient.

XXV. The Acid Tincture. It is an Alexipharm, good against the Plague and Pelletric, and all sorts of Pelletric Difficulties, by defeating the Heart, and destroying the very Efficac of the Malignity: It is also good against the bitings of Serpents or Mad Dogs, or any other Venomeous Creature, by destroying the fumes of the Poifon, and putting a Stop to its Career, that it may not infect the Blood, and contaminate the Vital and Animal Spirits. Dose to many Drops as to make the Vehicle, at Canary or other Wine, pleasantly sharp, and to be repeated 3 or 4 times a day, as necessity may require.

XXVI. The Only Tincture. It is a Nephritisck, and powerfully opens all Obstructions of the Knees, Urines and Bladder, also of the womb: It gives safety in the Strangury, provokes Urine, and cleanses the Urinary passages of all sorts of Heterogene matters, and many times carries off by Urine, the Mortiffick caufe of Palfies, Leathgeries, Apoplexies, Epilepsies, Rhenemutins and Gouts.

It opens Obstructions of the Womb, provokes the Terms, facilitates the Birth, gives safety in the Collick, and expellles Vapors, whether arising from the Stomach, Spleen or Womb. Dose from 6 Drops to 10, 15, or 20, in any proper mixture, as the Age and Nature of the Difficult may require.
Salmon's Herbal.

 Chap. DCXCVIII.

Of Thyme Wild: or, Mother-Thyme.

I. The Names. It is called by the Arabsians Huen: in Greek Σερπιλλον: in Latin, Serpyllum, and Scopulon, Scopulon. But in English, Wild Thyme, Mother Thyme, or Mother-Thyme.

II. The Kinds. There are many Kinds of this Plant, but we shall treat only of the five following, viz. 1. Serpyllum Majus florae purpureae; 2. Serpyllum Minor florae purpureae, or more albo, vel Candida. The greater Wild Thyme, or Mother Thyme, both with a purple and white Flower. 3. Serpyllum Vorticuflorae minor, Serpyllum Majus florae purpureae, or more albo, vel Candida. 4. Serpyllum Vorticuflorae minor, Serpyllum Majus florae purpureae, or more albo, vel Candida. 5. Serpyllum aureum, or a small Yellow, Gilded or changeable Coloured Wild Thyme.

The Descriptions.

III. The first, or greater Wild Thyme, or Mother Thyme. Its Root is buffy and thready, almost like that of our Common Garden Thyme. It grows more upright than other Wild Thyme doth, with two Leaves for the most part at a joint like the other, but greater, and not of so dark a green color. The Flowers grow at the tops of the Stalks, not much unlike to the Garden Thyme, of a redish purple color, but somewhat larger, as the whole Plant is: Its Smell is not venomously strong, but Thyme-like sweet, and of a hot Taste. There is another sort of this Species, differing only in these things, that its Leaves are of a fether green, and its Flowers of a white color.

IV. The second, or Clafur his Wild Thyme. Its Root is woody, and it grows up with many hard or woody branches, standing in a manner upright, or but a little inclining, set with many Leaves together at spaces, somewhat longer than in any other sort of Thyme. The Flowers grow in Racemes, or paces towards the tops of the Stalks, with some few Leaves at them, being of a purplish color, very like to Garden Thyme, which Leaves, or also the Stalks, are of a whitish bournets, and abide all Winter. It is of a strong heady aromatic Smell, a little like to Southernwood.

V. The third, or our common Wild Thyme, or Mother-Thyme. Its Root runs several ways under the upper Surface of the Ground, with many small Violets springing from it, which spreading Root springs up in several places, so that the Plant seems to be a roundish Buff or Drop of Thyme laid and spread about the same. It springs up with many hard boughs of Branches round about the said Root, all of them lying as it were upon the Ground, which also take Root again as they lie, and is spread thenceforward every way. The Leaves are small and of a solid green color, faulting like unto Thyme, but not altogether so acute or quick, nor yet of a longer, so hot or quick a Taste. The Flowers grow at the tops of the Branches of a purple color. There is another sort of this Species, differing nothing at all therefrom, but only in the color of the Flower, which is white.

VI. The fourth, or Musked Mother-Thyme. It has a running small fibrous Root, which sends forth Branches, growing as it were upright, but with fewer Stalks, and thinnest set with Leaves, which are somewhat longer than those of the Common

Mother of Thyme.
Chap. 699. English Herbs. 1159

mon Thyme, and not of so fast a green color: its flowering is in saunders towards the tops of the stalks and branches, and the smell of the whole Plant is very near to that of Musk, from which it took its Name.

VII. The fifth, or Gildel, or Changeable colored Wild Thyme. The difference of this Species from the common Wild kind, consists chiefly in the variable mixture of Green and yellow, in the Leaves of this Thyme; for the green Leaves thereof are in some striped, and in others edged with a Gold yellow color, which has given occasion to its Gilded or Changeable colored Name.

VIII. The Places. In many Foreign Countries where the Climates are warm, as Syria, Greece, Crete, Spain, Italy, &c. they are said to grow Wild, whence they are called Wild Thyme; but with us in England, they are all North up in Gardens: However the third Species I have found growing in many Counties of our Land, as in Norfolk, Cambridgeshire, Essex, Kent, Surrey, &c. That with white Flowers which is the more rare, has been found growing on rocky Heath, in Digweed-Meadow by Hatfield.

IX. The Times. They flourish all the Summer long, but their flowering time is chiefly in June and July.

X. The Qualities. The descriptions of the Mother-Thyme Plants, are altogether the same with those specified of Garden Thyme in the former Chapter; nor is there any manifest difference between them as to their Force, Virtues, &c., so that we need say no more thereof in this place.

TOAD-FLAX, see Flaxweed, Chap. 269, 270.

CHAP. DCXCI. Of Tobbaco English.

I. The Names. It has no Archaick nor Greek Name that we know of, being a Plant unknown to the Antients, but our Moderns have called it in Latin Petoim (which is said to be the proper Indian Name) and Nicolea, (from one nick a French Man, Resident in Portugal, who first sent it to the Queen of France, from whence it was also called Thymus Regum.) It was also called Tabacco, as first coming to us from an Island of that Name in the West Indies: Label accounts it a kind of Hysocyamus or Henbane, and therefore called Hysocyamus Laccus, and Hysocyamus dohler, as being a yellow or doubtful kind of Henbane. We in English call it Tobacco.

II. The Kinds. It is either L. English, called Petoim Anglica, Nicolea Anglica, English Tobaco, of which in this Chapter. 2. Or Petoim Indicum, Petoim Americanum, Petoim Hysocyamus, Nicolea Mexicana vel Peruviana, Nicolea Virgiana, Indian or American Tobacco, of which in the second Book of this Work.

The Descriptions.

III. Its Root is neither so great norusty as that of the Indian Kinds, and persists every Year with the Stalk in Winter, but generally comes up again after the Seed, which is shed of its own accord. It rises up with a thick round Stalk, about two Feet high, on which do grow thick, fat, and softly green Leaves, nothing so large as the other Indian Kinds, neither for length nor breadth, a little roundish pointed, and smooth on the edge. The Stalk is branched out sparingly, bearing at the tops of each Branch several Flowers, set in green Heads like the others, but nothing so large, scarcely getting above the brim of the Heads, round pointed off, and of a greenish yellow color. The Seed which follows, is not so bright as the Spanish or Virginian, but larger than it, and contained in the same large Heads.

IV. Gerard describes it thus: Its Root is small and thready, it grows to the height of two Cubits: the Stalk is thick, fat and great, full of a spongy Furf, and it spreads out into several Branches, set with smooth and even Leaves, thick, and full of Juice. The Flowers grow at the tops of the Branches, orderly placed, of a pale yellow color, something lighter than those of the Black Henbane. The Caps in which the Flowers do stand, are like, but lighter, tenderer, and without short points, on which stands the Flacock Head, something round, full of every small Seed, not much unlike the Seed of Marigold.

V. The Places. This was brought into Europe in Seed by Nieuw, with the Seed of the true Indian or American Tobacco, of which this our present Plant is certainly a Species. Lobe thought it
to participate both of Herbs and Tobacco, from whence he was induced to give it those particular Names; but it is used by many instead of Tobacco, and is also called by the same Name, being first brought (as it is thought) from some parts of Brazil, which is probable from Ainsa Agency in Portugal, to whose King the whole British Country was subject. It is also said to be brought from Trinidad (an Island in the West Indies) and from Virginia, and several other places, and being cailed in Pipes as other Tobacco, in Jamaica, as youick, work the same effects, of Drunkenness, fasting the Stomach, revolving the Spirits, and strengthening the whole Man (in such as be accustomed to Tobacco) as the true Spanish, Tobacco, is used in England, and is more familiar with us than the other Indian Kinds are. Being Sown here, it prospers exceedingly, information that it is not as liable to be destroyed by it once has Sown is fell.

VI. The Time. Partickson says it early gives ripe Seed, whereas the other Indian Kinds seldom do. It Flowers from the beginning of June, to the end of August or later, and oftentimes till the Autumn is far spent; the Seed ripening in the mean time.

VII. The Medicines. Thoufand think this Plant to be cold, yet Label is of Opinion that it is hot, because of its biting tafle, and it is probable to be hot and dry in the second Degree: It is applicable for Cold, Lasker, Affrighted, Vomiting, Sickness, Catalogic and Salivation.

VIII. The Specification. It causes an expellation of cough, has a diaphoretic Force, opens the Lungs, and kills Worms in the Stomach and Belly, and eafe Gripping Pains in the Bowels, provokes Urine, cleanses the Urinary passages, is good against Tumors, Aphtom, Boils, Bils, Scabs, inrectes Ulcers, Kings’ Evil, Sores, and the like.

The Virtues.

X. The Liquid Juice. Partickson says that it is efficacious to cure the Dropsey, by taking 4 or 5 Ounces of the Juice falling, which will strongly purge the Body both upwards and downwards.
I have had no Expérience of it, but it is very probable that it may cure the Dropsey, if given by a wife Hand and in a due Dose. I should be afraid to give 4 or 5 Ounces at a time, by reason of its Violence, but it is a confirmed use of it, beginning with a small Quantity, and gradually increasing it, that must determine how much may be safely given at a time. Amorandus says it is an Aclarification against the Stinging or Biting of any Venomous Creature, being immediately applied to the hurt place.

XI. The Syrup of the same. It is found by good Experience to expell cough, and drive Flegm out of the Stomach and Lungs. It kills Worms in the Stomach and Belly, easys the Head-ach and Megrim, as also the Cholick and Gripping Pains in the Bowels; tho’ for some time it may seem to cause more trouble in them, and diftiffent the Stomach. It is profitable for those who have the Stone or gravel in the Kicks or Bladder, to ease their pains, expel them, and provoke Urine.

XII. The Seed. It is said to be more effectual to ease the Toothache, than any Honebane Seed.

XIII. The Ointment. Take of the Green Herb a handful, bruise it, and add to it Oil or Suet, and drop them on a gentle Fire till the Herb grows crisp, and the Oil will bubble no longer, strain out the Oil by pressing, and add to it Beer-Wax, and Suet, and keep of it a quare of a pound, Turpentine; and when it has been well bruised in a Mortar, Oil Olive 2 Quarts, mix, and boil gently to crozephyr, and the balsam to crape. Strain hard out by pressing, and add thereof Water, 2 Quarters, 8 Ounces of Tar, turpentine 2 Ounces, melted and mix them well together, and keep it for use. If to this there be added three Quarters of pure delphic Powder of Virginia Tobacco, it will be so much the better. It expelles Worms, Canker, and cures Ulcers and Sores of the Kings Evil; it also cleanses and heals all sorts of old Sores and running Ulcers in any part of the Body, being applied; it also expelles Blisters and Scaldings, being applied by what means soever; and in healing simple green Wounds, Contusions, &c. it is no second.

XIV. The Powder of the Leaves and Stalks. Used as a Stomacatory, it opens the Head, and cleanses it of the Remnants of the Brain: Strewed upon old Ulcers, it dispenses them to a speedy healing, it also kills Lice in the Head.

XV. The whole Leaves. Applied to any Ulcer cleanses it of all that is noxious, and cures Ulcers and Sores of the Kings Evil; it also cleanses and heals all sorts of old Sores and running Ulcers in any part of the Body, being applied, and also expelles Blisters and Scaldings, being applied by what means soever; and in healing simple green Wounds, Contusions, &c. it is no second.

XVI. The Cataplasm of the Leaves. Applied to the Belly, it expelles Blisters, Poisons and Food, and cures, and kills Worms in the Stomach and Belly. Made by gentle bruising and applying, it much prevailes against the Evil in 12 or 14 days time. Applied to any green Wound, it induces a speedy healing.

XVII. The Distilled Water. It is often given dialysed with Sugar, before the Fit of an Ague, both to lesten the Pains and to alter them, as also 5 or 6 times using it is said to cure this Water will taffle of the sharpness of the Herb, which is not usual in other Distilled Waters; it also expelles Flegm out of the Stomach and Lungs. 

XVIII. The Liquor. It is made of the Feces not Distilled to dryness, (the Herb being bruised before Distillation) digested in Horbe-Dung for 14 days, and then hang up in a Bag in a Winc-Cellar, from whence this Liquor will flow and drop down. It is good for Cramps, Aches, Gouts, Scatica, Itch, Scabs, foul Sores, running Ulcers, and various other complaints.

XIX. The Decoction of the Leaves. It has all the Virtues of the Juice and Syrup, but weaker. It kills Lice, and cures running Sores in Childrens Heads.

XX. The After of Leaves and Stalks. They cleanse the Gums and Teeth, and make them white. Their Infusion in Water is said to cure the Itch, Scabs, Leprotic, &c.

XXI. The Cut Leaves for Smocking. It is held to be nearly as good as our Common Virginia, commonly Smoked in Pipes, but because of the plenity of that, is seldom used.
Chap. 700. English Herbs.

CHAP. DCC.

of TOOTH-WORT:
or,

TOOTH-RAPE.

THE Names. It has no Greek Name that is known, being a Plant the Antients were ignorant of; our modern Authors have called it in Latin Dentaria, (from the likeness of its Roots to Teeth) also Dentillaria, by some Squamatia and Squamaria, also Dentaria, (from its likeness to Scales) in English Tooth-Wort, Tooth-Rape, or Toothed-Lungwort.

II. The Kinds. There are several sorts of Toothworts which are rooting of Kim, or have no relation one to another, excepting in their Names; as the Dentaria, commonly called Corontworts, of which we have already spoken at large, in Chap. 152. also those which are no Species of the Plant we here intend. The Tooth-Worts in this place are of another form and purport, and are chiefly two, viz. 1. Dentaria, Dentaria major Matthioli, Amblyodon Dodoens, Arcidiaconus Eschul- gius, Kjeldermann Plinius Gersoni, Squamatia, Squamaria, Radix Squamatoria, Orthonauchia Dentaria major, The greater Tooth-Wort, Tooth-Rape, or Toothed-Lungwort. 2. Dentaria minor, Dentillaria, Dentaria Assofos, Apophyllum Clavi, Dentaria Corallidea radice, The lesser Tooth-Wort, Tooth-Wrap, or Toothed-Lungwort.

The Descriptions.

III. The full, or the greater Tooth-Wort, Tooth-Wrap, or Toothed-Lungwort. It has for its Root small Scales, (if they may be so called,) like as the Scales or Branches bare, which confit likewise, wholly of blackish purple, joining thick Scales, lying pretty close together, compact one upon another. In the beginning of the Spring, there rise out of the tops of these Jolly Branches, tender and bristle feppy Stalks, about a span in length, without any Leaves, but bearing many whitish purple gaping Flowers, and blackish inward, standing in clusters, in which afterwards grow up small Vessels, with small Seed in them.

IV. Gerard describes it after this manner. There is often found among the Multhrooms, a certain kind of Excrement consisting of a Gelly, or lift substance like that of the Multhroom. It rises forth of the Ground, in form like unto Orophanche or Brook-Rape, and also in substance, having a tender, thick, fibrous, or milletpen Body, consisting with were of Scales like unto Teeth; (whence it took its Name,) of a dally shining color, tending to Purple. The Stalk rises up in the middle, garnished with little gaping yellow Flowers, like those of Saturey, on their outside of an overworn whitish color. The whole Plant resembles a rude form of that Gelly or fuzzy Matter found in the fields, which is called the calling of Stars, or Ignis Fatua. Its Root is small and tender.

V. The second, or lesser Tooth-Wort, Tooth-Rape, or Toothed-Lungwort. Its Root is smaller, left jolly, and more white and transparent, almosty dairiarinated like Coral, white of color, full of Juice, and without any Fibres annexed to it. The Stalk is in like manner without Leaves, bearing whitish purple Flowers at the top, sometimes but two or three, and sometimes many more, but varying in some places, as being of a more purplish color. Gerard says, that this differs not from the former, seeing that it is altogether left, but in most other respects alike.

VI. The Places. They grow most commonly under Trees where they have much shade. Gerard says they grow at the bottoms of Elme-Trees, and such like, in shadowy places. He found them growing in a Lane called Boll-Lane, going from Middleton in Kent, unto Ciche-Heath, half 3 Miles from the Town, and in other places, thereof about, as also in the Fields about Crowton, especially about a place called Grover; and in a Wood in Kent called Ben, or Rough Bull, near Crowton, also near Harwood in Lancashire, in a Wood called Tylcho-Head, a Mile from Whorley.

VII. The Times. They spring up and grow thro' all the Summer Months, and Flowers in July and August.

VIII. As to their Qualities, Specification, Preparations and Uses, Authors have said nothing, but from the use our Country People make of them, it is probable that they may be Cooling, Drying, aperitif, Alitentic, Astringent and Pulmonic, or appropriated to the Lungs, for which reason they have called it Lungwort, which Authors have disfigured (as aforesaid) into the greater or lesser kinds.

IX. The Reception in Wine or Water. Being well sweetened with Honey, it is good to open Obstructions of the Lungs, to loosen and expel the dark thick rough Phlegm which suffocates them up, and causes Hoarseness, Wheezing, Throats of Breath, and difficulty of Breathing; and therefore may be of good use in Asthma's, Pthisicks, and other like Diseases of those parts, proceeding from Repletion.
Salmon's Herbal. Lib. I.

CHAP. DCCI.

OF TORRENTIL, OR, SETFOIL.

I. THE Names. It has not been writ of by any of the Antient Greek or Latin Authors, yet some of our Moderns have given it a Greek Name from its form, or number of Leaves, viz. *Leafmon, Hepstsys, from whence it has been called in Latin Setesfolium, in English Setfoil, or Seven-Leaved Cinkfoil, which is not properly so, for it has not seven Leaves, but each Leaf for the most part is divided into seven parts, or very eminent divisions, so that each part looks as if it were a particular Leaf. It is also called in Latin *Tormentilla, and by some *Stellaris, from the Form of the Leaves, and by others *Confolida rubra, from the effects and color of the Roots, and in English Tormentil.

II. The Kinds. There are several Species of it, but we shall only treat of two, which are most common with us, viz. 1. *Tormentilla vulgaris, Pentstemon comum, Tormentilla minor, Our Common Tormentil or Setfoil. 2. *Tormentilla major, Pentstemon major, Tormentilla vulgaris major, Tormentilla Alpina Cameraria, The greater Tormentil or Setfoil.

The Descriptions.

III. The first, or our Common Tormentil or Setfoil. Its Root is black without, reddish within, and rather leening wider; its Leaves and something longer than Cinkfoil, yet are something larger than the former; sometimes they may chance to be but few in number, but for the most part seven (as the first above described) a little joints about the edges, and the Flowers grow on the top of the Stalks, very like to those of Cinkfoil. This differs but very little

Tormentil Greater.

red within, and sometimes a little crooked, having many blackish Fibres adjoining. This Plant is so like to Cinkfoil, that many mistake it for the same. It has many reddish slender leafy Stems rising up from the Root, which bke upon the Ground, or rather leaning than standing upright, with many short Leaves which bend much to the Stalks than those of Cinkfoil do, with the Pedicel or Root stalk accompanying the Branches at divers places, but those which grow next to the Ground, are set upon long Vines, each of whose Leaves are like unto the Leaves of Cinkfoil, but something longer and leffer, and dentèd about the edges, many of them divided into but few Leaves or parts, but most of them into seven, from whence it took the Name of Setfoil. And standing round (as it were) in the division like a Star, whereby obtained the Name of Stellaris, yet some place five Leaves sometimes, and some eight, as Nature and the Fertility of the Soil are pleased to form them. At the tops of the Branches, come forth several small yellow Flowers, consisting each of five Leaves, exactly like the Clove of Cinkfoil but smaller.

W. The second, or greater Tormentil or Setfoil. Its Root is black without, reddish within, and thick, tuberous or knobby. As this (with the former) may be accounted among the Species of Cinkfoil, so it brings forth many Stalks slender and weak,
Chap. 701. English Herbs. 1163

little from the former, but only in the Magnitude of the Leaves and Roots, which are much greater and redder, and of a bitterer Smell, but in all things else alike.

V. The Places. The first grows as well in Woods and shady places, as in open Chapman Grounds, and about the Borders of Fields in many places of this Kingdom. The second grows in such like places, but delights chiefly in a richer, and sometimes a more sandy Soil. They are both Planted also in many Gardens.

VI. The Times. They Flower all the Summer Months, as from May to the end of August.

VII. The Qualities. It is very little hot, fearely in the first Degree, but dry in the third, Affirmative, Absorbent, Vulnerable, Stomatiek, Cardiack, Sudorific, and Alexipharmatic, of very thin and fubtle Parts.

VIII. The Specification. It prevails against the Plague, and all manner of Malign and Petitional Diseases, expels Pohton, and defends the Heart. It cures Agues, the Blood-Flux, and all other Fluxes of the Bowels, allo Spitting, Vomiting and Piling of Blood, and stops the overflowing of the Terms in Women, and the Defluxion of Humors to the Womb, Sore or Ulcer. Opens Obstructions of the Lungs, Liver and Spleen, and is of excellent use in the Cure of the Jaundice, and to heal simple gross Wounds in any part.

The Virtues.

X. The Liquid Juice of the whole Plant. Itrops all Fluxes of Blood or Humors in Man or Woman, whether at Night, Month, Belly, or any Wound in any part, refills all Poltton, and the Plague or Peltission it self, and all Petitional Diseases, and such as are Intoxications, as the Marls, Small Pox, Purple, Spotted Fever, by expelling thro' a gentle Diaphorhea, the malignity from the Heart. Drink a Specious Morning and Night, in a Glass of Milk'd Suck, or other Styprik or fit Wine.

XI. The Essence. It has all the former Virtues with advantage, as being the more efficacions Medicament. It cures Agues, being given Some Hours before the coming of the Fit, and the Patient laid down to Sweat thereupon, being repeateed for some considerable time. It is an effectual Antidote or Counter-Poison, Anti-petitionall, and a Cure for the yellow Jaundice. There is scarcely any more effectual Remedy against the Blood-Flux, or any other Flux of the Belly, it strengthens the Stomach, stops Cholerick Vomitting, helps the difcovery of the Blood, and opens Obstructions of Stomach, Lungs, Liver and Spleen. It is good against Fumes, Vapors, and Furer or bitter Bchteings, and Ieastring of the Stomach: It is proterable against the malignity of Venereal Diseases, and cures the Lues, because it so mightily rebills Putrefaction. It purges the Womb, stops all its Fluxes, and prevents Mcarriage. It is effectual against the malignity of Venereal Diseases, and cures the Lues, because it so mightily rebills Putrefaction. It purges the Womb, stops all its Fluxes, and prevents Mcarriage.

It makes a good Injection for tool, corrupt, and rotten Sores and Ulcers in any part, chiefly in the Mouth, Throat, Jaws, and privy Parts of Man or Woman. And is of singular use for the Cure of the Kings-Evil, being inwardly taken and outwardly applied: Mixed with Vinegar, and applied to Sores, Ulcers and Scabs in the Head, and other parts, it quickly heals them. It is effectual against the Hemorrhoids or Piles, they being bathed and fomented thorough warm; and is profitable against the Whites or Redds being inwardly taken, and outwardly applied, by injecting it up the Womb with a Womb Syringe. Dose 3 or 4 Spoonfuls Morning, Noon and Night, in some proper Wine or Limer.

XII. The Decoction of the Wine. It has all the Virtues of the Juice and Essence, but not altogether to potent, and therefore must be taken in greater quantities, as to half a Pit in a time or more: Mixt with Honey and Alum, it makes a good Lotution to cleanse, dry and heal, old filthy corrupt running Sores and Ulcers in any part: And Andreae Valentinus, says, that the Decoction of the Root is no les effectual to Cure the French-Pox, than Guascum or China, because it so mightily refills Pus and Feste. Taken as a Bath, it is an effectual remedy against Abortion, in Women who are apt to Miscarry.

XIII. The Powder of the Root. It is Styprik, and putrefaction, and the Virtues of the Juice and Essence, being given in any proper Styprick Wine, or other lik Vehicle, from a Dram to a Dram and half, Morning and Evening for some time. Strewn upon a moist running Sores and Ulcers, it drys them, and induces their healing, and to much the more, if mixed with a quarter part of Scammony in Powder, Labert' says, that Rendentricium used it in the Head, or in the same manner, as he used Hermodendrum for joint-aches. Taken in Juice of Plants, it is said to kill Worms in Children, Cure Ruptures, and difficks and hurt Contusions from Falls &c. being inwardly taken, and outwardly applied.

XIV. The Balsam. Take of the Powder 4 Ounces, Oil Olive 3 Ounces, Balsam of Peru 2 Ounces, Beer Wine two Ounces and a half, melt, mix and make a Balsam. Applied to the Reins, it cais the pain thereof, and helps such as cauld hold their Water; casts the Gout in any part, is profitable against the Piles, and dissolves all Knots, Kernels and Tumors in the Neck, &c. from the Kings-Evil, and heals the Sores and Ulcers proceeding from the same.

XV. The Cataplasme made of the Roots and Leaves. It diffuses simple recent Contusions, gives cals in the Gout, renders the Flux of Humors to any part, and is profitable to dissolve or diffuse Tumors, Swelling or Kernels in the Neck, caused by the Kings-Evil, or super-abundance of Evil Humors.

XVI. The Diffilled Water. Take the Herb and Root, bruise them well, steep them in Wine for 24 Hours or more, and then draw off the Water in Balneo. It has the Virtues of the Juice and Essence, but much weaker in its Effect, and may be given in lieu of fine Sugar, from a quarter to half a Pint. If it is given with a Dram of Venetiae-Thatreone or Mithridate dissolved in it, and the Patient (being in a Naked Bed) put to Sweat thereupon, it will profertently provoke Sweat, and so expel the Poison, and defend the Heart and Vitals from the Malignity and Infection of the Plague or Petitionall, and from the danger of any Petitional or Infectious Disease. It is good to give eate in the Piles or Hemorrhoids, by bathing them therewith, and if a little Camphor be diffick...
Salmon's Herbal.

Ch. DCCII.

Of TOUCH-WOOD: OR, TREE-MUSHROOME.

I. The Ear. It is called in Greek Mycetoma (ab enzymo, Populos nigra), because in Africa, Greece, and most Southern Countries, it was gathered malt from the Tree, or the Wood thereof, tho' it was also found on Oak Trees, the Beech, Olive, and other Trees. It is also called Morum, velurnbod, Fungosus, because of its Fungous substance or property: in Latine Fungus Ignarius, Fungi Arborum, Fungii Arboris, in English Touch-Wood, or Tree-Mushroome.

II. The Kinds. It is 1. Fungus arborum durior, Fungus arborum durior, Fungus Ignarius durior, The harder Touch-Wood. 2. Fungus Ignarius mollior, Fungus arborum mollior, The softer, or more Spongy Touch-Wood.

Touch-Wood: OR, Tree-Mushroome.

The Descriptions.

III. The first, or harder Touchwood. It is a kind of Mushroome, which grows harder than other Mushroomes, and is of a dry Fungous substance on the inside, which may be cut into pieces, or into bits, or broken into several pieces, having a hard or woody Craft on the outside. It is of differing Forms and Colors, some being great and flat like the Head, and smaller and rounder underneath, of a brownish-yellow color, which Lobel compares to Agrick.

IV. The second, or softer, or more Spongy Touchwood. It is very much refinements Aurelia Junc, or Jews Ear, and does in continuance of time, grow about to the Substance of soft Wood, but more porous, softer, and gentler than the former, and more shaggy, being the soft part being circled, or half round, whose upper part is somewhat plain, and sometimes a little hollow, but the inner part as it were, plated or purp'ed together. In short, it does not much differ from the former, but in its more soft, spongy and pliable propriety.

V. The Places. They grow upon the old bodies of Trees, and other old Wood, as on the Oak, Beech, Olive, Poplar, and many other kinds of Trees when they grow aged, decay'd, or begin to decay.

VI. The Times. They may be gathered at any time after they are come to their Magnitude, and hardness or consistence.

VII. The Qualities. They are Deleterious or Poisonous as Authors say, and therefore never given inwardly.

VIII. And as to their Specification and Virtues, we have nothing to declare; as not knowing any thing of them either by our own Experience, or by relation from others.

IX. The Preparations. Of them there is made, 1. Tents to enlarge narrow Orifices in Apertures when broken, or opened by Incision. 2. Touchwood, which is used in place of Tinder.

X. The Making of Tents. The outward Skin being taken off, the Fungus is to be boiled in a Lixivium of Wood Ashes, then taken forth and pressed very dry; after which, it is to be well soaked in a Strong Mixture of Gum Tragacanth, or Gum Arabic, boiling hot, for 12 Hours or more; then the Gum to be squeezed out, and to be pressed hard together in a wooden Press, letting it lie therein till it is dry, and so it is to be laid up and kept for use. This you may shape into Tents of what Form and Magnitude you please, which are use'd to widen the hole of a Tumor, Apotemn, or Ulcer after it is broken, or to keep it wide and open after Incision, the better to let out the putrid or corrupt matter: And this it does by reason of its swelling, being moistened with the Sanities or Humidities of the Sore to which it is applied.

XI. The making of Touchwood. It is done in two ways. The first way is, after the outward Skin is pared off, to boil it exceeding well once or twice, in a strong Lixivium of Pot Ashes, or Wood or Nettle Ashes, letting them dry at leisure, which being cut or broken into pieces, will take Fire from the Steel and Flint like Tinder.

XII. The second way. Take Pot Ashes or Wood Ashes eight or nine Pounds, make there of a strong Lixivium or Lye in Water, in which dissolve a Pound of pure Salt Petre; in this Liquor boil the prepared Fungus, till all, or most of
Chap. 703. English Herbs. 1165

of the lye be wafted, which if you please, you may repeat a second time; then dry it, and keep it for use. This is much better than the former.

TOUCH-ME-NOT, see Creti-Garden, Chap. 161. see Cucumber Wild, Chap. 179. see Mercury Wild, Chap. 488.

TROY-WORT, see Shepherds-Purse, Chap. 671.

CHAP. DCCIII.

OF TRAVELLERS-JOY: OR, WILD CLIMER.

1. THE Names. It is called by Theophrastus in Greek, Arumon, &c. in Latin, Clematis Syphoefris, & Vierna Gerardii & Loblis (from the same author.) in Minerva Galluarii, Rustici, Veris minori Pachyon, Vitello Dohoe: in Aragon; Theophra tus Anguillaria & Chafon: Viits Syphoefris Flurni lib. 15. cap. 4. Viirt Syphoefris confults Gesmeri in Hort. Vitis Syphoefris Dufcoridae Anguillaria, in English, Travellers-Joy, or Wild Climer.

11. The Kinds. There are but two which are chiefly known to us, viz. 1. Clematis Syphoefris Loblis, & Clematis Syphoefris latifolia, five Vierna Gerardii, Clematis alera prima Cordi, Clematis tertia Blauthii (known also by all the names in the former Paragraph.) Our common great Wild Climer, or Travellers Joy, as Gerard calls it. 2. Clematis Syphoefris alera, Clematis Syphoefris Bicora, Clematis alera Bicora Chafon; Clematis pareresina sititi Pyri incis Bothing; The great Spanish Wild Climer, or Travellers Joy.

The Descriptions.

III. The first, or our common great Wild Climer, or Travellers Joy. Its Root is great, tough, and thick, and is composed of a number of roots, which go into several long branches under Ground. It has in some places, (especially if it flourish long in a place) a thick, strong, rugged, woody Stem, Stalk or Trunk, with several Chaff or Film in the Bark, of a greyish color; from whence shoot forth many long, linear, greyish, green Branches, more strong and woody than any of the other Climers, (as the Ferwinekille, Virginis - Bower, Lades - Bower, Virginian - Bow- er, &c.) so that their Branches do in many places, serve as Withers, to bind about, or bind up any thing wished, or to bind about Garden or Field Gates. These Branches spread upon the Hedges or Trees, or whatsoever it flours next unto, dividing or spreading it self out into many other Twigs, on which are set at the several Joints, two long Stalks of wondrous Leaves, confults of four Leaves, two and two together, and one at the end, each of them being dented on their sides; on each side for the most part with but two Natches, yet sometimes, the more rarely, with three: They are of a pale green color, tolerably sharp and hot, rising upon the Tongue, but not so much as the Burning Climer, or Virginis-Bower. These Branches mind themselves about any thing standing near unto them, for great may, length or height, rising up to the top of the tallish Cypresses-Trees if planted near it, on which it may climb, and come in these Trees 1 foot from above 150 Feet high in America.) Gerard joy, that these Twigs or Branches are full of clasping Ten-
Salmon's Herbal. Lib. I.

Hops, I say, not much unlike to those of the Pear-Tree, rounded about the edges, but sharper and smaller, which are of as sharp and hot a taste as the former, from whence come also two chiefing Twigs or each side, by which it catches hold of any thing which stands in its way, or near it. From the Fruits likewise, where the Leaves stand, come forth the Flowers with long Tails or Heads, in the same or like manner as the former, with the like Twisted Plumes of Flowers, as a hoary white colour, with Seed like the other below them, but smaller.

V. The Places. The last grows in many parts of England, in Hedges of Fields, and by the High-way side in Bedfordshire, Buckinghamshire, and Essex, but chiefly in Kent, where from beyond Woodstock to Gravesend, and from thence along to Canterbury, you may see it in many places, as also in most of the Southern parts about London. The second is a Native of Spain, found by Oliver, between Altes Sèvres and Calais, and in other parts thereof; It is also said to be a Native of our own Land, for Gerard says, that he had found it in the Isle of Wight, and in a Wood by Wallipaux Abbey.

VI. The Times. They both Flower in July, and their Plumes appear in November and December, and in some places all the Winter.

VII. As for their Qualities, Specification, Preparations and Virtues, Authors have said nothing at all, and therefore are not at all used in Physick that I know of, tho' they are both very hot and sharp in Tails. They are esteemed for the Pleasure which they give by their goodly Shade, which is gained by their walking out and climbing; as also for the Beauty of their Flowers and Plumes, accompanied with a sweet and fragrant smell.

VIII. Note. These (as well as the other Clivers) may serve very well to make Arbores in Gardens, Orchards, or other places for Pleasure, for which purpose they are much more fit, than for many other things which are used on that account.

TREFOIL Splashed. See End-Foot, Chap. 237.

C H A P. DCCIV.

Of TREFOIL Sweet:

or

Garden CLAVER.

I. THE Name. Trefoil is called in Greek, 

Trepofia in Latine Trifolium, (because of its having three Leaves upon one Footstalk) and in English, Three-Leaf'd Grass, Clover, Clovers, and Trefoil.

II. The Kinds. There are a great many Species of this Name, but we shall only take notice of these which are to be found with us, which are 1. Trifolium Odoratum, Sweet or Garden Trefoil, of which in this Chapter. 2. Trifolium pratense, Meadow Trefoil, of which in Chap. 705. 3. Trifolium Silvaticum, Coddled Trefoil, of which in Chap. 706. 4. Trifolium Pseudofolium, Marsh Trefoil, of which in Chap. 707. 5. Trifolium und Latifolium, Petty Trefoil, of which in Chap. 708. following. 6. Trifolium fragiferum, Stella-tis, Strawberry and Scary Trefoil, of which in Chap. 709. 7. Trifolium Arboratum, Griftar, Tree Trefoil, of which in Chap. 710. 8. Trifolium Atriplicum, Sower Trefoil, or Wood-Sorrel, which see in Chap. 641. following.

III. The Garden Kinds. These are but three sorts of this Sweet Trefoil, which grow with us in our Gardens, viz. 1. Hede's Foot, Diapheredia, Trifolium Odoratum, Lotus Urbanus

Lotus Salvio Cameratif, Cordi, Pedonari, Phylleis, Gynici, Trifolium D'flatoidi Trigus, Trifolium Odoratam altrum Pedonor, (because he called Melior Trifolium Odoratum, ) Lotus Hortorum Olera Labelleis, Lotus Hortensis Odora Baumbius; (but Tabernaeuinaeus calls it Melilotus vers, which it is not,) Now most call it Trifolium Odoratum, which is our Sweet or Garden Trefoil, or Clover. 2. Trifolium Asphodelites, vel Asphdelium, Trifolium Biceium, Istrophyllum Gerfini in Hortis, The stronger named Garden Trefoil or Clover. 

TREFOIL Sweet: or, Garden CLAVER.

Spring, It rises up with one strong, round, whitish Stalk, 3 or 4 Feet high, spreading out many branches on all sides, about which are set many Leaves upon long Footstalks, three always set together, of a whitish green color, very fine, and a little dotted about the edges, settling not worth unlike a Yarn-grass. At the Top of the Branches grow Flowers, chiefly set together, each of them like to those of Meilotis, but larger, and of a black or pale toothed bloom color, after which, come round white heads, containing dark yellow colored Seed.

V. Gerard
V. Gerard describes it after this manner. It has a main stem or stalk, with several branches, from which spring up an upright stalk, hollow and about 2 feet high, dividing it into divers branches, on which grow Leaves by three and three, (as the ancients) golden and greyish, the latter es- easily nicked on the edges, from the bottom whereof come the Flowers, every one standing on its own single leafstalk, confining of little hairy Hats, of a light or pale blinfen color: After which, comes up little Heads or Knobs, in which lies the Seed, of a whiti fl yellow color, and shorter than that of Fumago. The whole Plant is not only of a whiti fl green color, but alfo of a Juet Smelt, grom Aromatical or Spicy, and yet more fucces when it is dried, which Scent the gathered and dryed Plant, does continue in a long time. Also whifi driver, it fmits more in moift and rainy Weather, than in hoat and dry Weather.

VI. The second, or strongest smelling Garden Trefoil, or Caffer. It has a Fibrous Root, which alfo perfifhes every year, but abides all Winter in better Climates, where it is Natural. Its firft Leaves are a little larger than thofe which grow higher up for the Stalks, three always standing together upon one leafstalk, of a dark green color, almoft ftining, fet with fome haireries thereon. The Stalk is frong, round, and bury off, rising up to the height of two Feet or more, on which grows this Plant, higher than the lower. It branches from the bottom ufually, to the top, where grow many large Flowers in a Batch or Sheaf, thick fet together, of a bright purple color, and {omewhat hairy or knoby without, especially the Husks containing the Flowers, which afterwards turn into broad brownufh hairy Seeds, each contain- ing but one Seed, which is a little brown and pointed at one end. The Smell of the Leaves and whole Plant is frong, which alfo it is young, fome fay it will {mell like Rue, but growing old, the fand Smell grows ftronger, which they fay they ftimulate difcovering like Bruine. With this frong Smell grows weaker every Year than other, and af- ter the second Years Sowing, has almoft no Smell at all; but in its Native Countries, it always re- tains its Original Smell.

VII. The third, or American Trefoil. Its Root is fmall and branched out, being Fibrous or fibrous, and fo spreading two feathered ways, and fo spreading two feveral ways, and fo springing fewerd round, Stalks leaning to the Ground, and spreading themselves out into many Branches, on which grow fewerd Leaves, three Leaves upon one leafstalk, of which in fomeftant round, not much like the left Deferibed, faying that they are larger or broader, and of a dark green color. The defcent of the Leaves, and the manner and growing of this Plant, differs not much from our Common Meadow Trefoil, fo much alike are the Smell. The Smell of the Leaves, and whole Plant is frong, but not much unlike the Deferibed. At the tops of the Stalks and Branches, grow long fjaky Ears of whitifi Flowers, being something smaller than thofe of the f.named Kind befieribed, after which, come in their places fewerd round, fome of the Ears being fleerer.

VIII. The Places. The firft and fcond grow in France, Germany, Italy, and England, but only in Gardens. And Difperfes fays, that the firft grows in England, this time, and not Wild in Greece, or any other place that ever he heard of. The third grows in the more Northern parts of America, as Canada, New-England, Virginia, &c. for which reason, for that possibly none of our English Flowers may at some time or other, find it in some of their Plantations.

IX. The Times. They fower in June and July, and their Seed is ripe in fonie little time after, but the other two flowering later with us, seldom perfect their Seed here.

X. The Qualities. The firft (which is chiefly used) is according to Galen, temperate in respect to heat or cold, dry and moist. They are Aperientive, Anodyne, Diuretik, Vulnerary, Hydri- fic, and Aphrodisiac.

XI. The Olification. It cures Difices of the Eyes, difices Tumours and Contusions, heals Wounds and Ulcers, eases the Gout and other pains; provokes the Terms, as alfo the Lecher when flopt, and is prevalent againft the bites of Vipers and other Serpents, as alfo gives caufe in the Stonyurie, and other Ropages of Urine.

The Virtues. XIII. The Liquid Juice or Effenfe. They may be given to 4 6 Spoonfuls alone, in Wine, or other fit Vehicle; it cures the pains of the Spicen and Hypochondia, opens Obftructions of the Uf- cera, provokes Urine and the Terms, as alfo the Lecher when flopt gives cafe in the Stomach, orcaft and Bolding of Urine, and is good againft the bites of Vipers and Serpents, or of other Ven- onous Creatures. Any Chiple Wound, Sore or Ulcer, being wounded herewith, it cleans, dries, and restores the healing; disfiges Tumours and re- cent Contusions, and gives cafe to external pains. Both Disperfes and Galen, commend this Plant in particular, againft the bites or drawing of any Serpent, or other Venonous Creature. This Juice is also good to wash the breakings out with Scaf, or Scals of Childrens Heads, or any other part, and to wash places bitten or bitten, &c. as Pity h. 21. cap. 21. advifs.

XIV. The Decoction in Wine or Water. It has all the former Virtues, but heafe, weaker, may be given Morning, Noon and Night, to half a Pint or more outwardly alfo, applying it by Bathing or Fomentation, to the parts affailed.

XV. The Oyemel. It is made of a Decoction of the Herb, Flower, and Seed in Vinegar, and then compounded with Honey. This helps the Brain, is a {pecial remedy for fuch as are bitten or flung with any Venenous Creature.

XVI. The Powder of the Seed. This is of mofl force with Galen, who appoifs it to be put into Treacle or Aluminate, againft all Difices for which the Herb is good. It is indeed fignal good againft the Phisitite, heat, burning, and Ropage of Urine, and the Stonyurie: it is profitable against the Epilepsy, Vapors, and Hylleck Fits. Dose two Drums or more, in home fit Vehicle.

XVII. The Oil by Infuion or Decoction of the Leaves, Heads and Flowers. It is excellent to dif- cufs all hard Swellings, or Wen-like Tumors in any part of the Body, to alay Inflammations, diget Sores and Ulcers, bringing them to Maturity, then clearing them from their patrit Matri, or relufing them in fuch a manner as to be admired: It heals alfo green Wounds, as well as old Ulcers; helps Contusions, and eafe any pain of the Gout; makes all Worms and Aches in any part, Stitches, Cramps, Lamendes of the Joints, &c. XVII. Vir.
Salmon's Herbal

XVIII. The Balsam. It is made of the former Oil, by adding to it a proportional quantity of China Turpentine and Bass-Weight. It has all the Virtues of the Oil aforesaid to advantage, and is a more excellent Venerary and Arthritisick, being applied.

XIX. The Diluted Water. It is good to clear the Skin, and dry up Scabs and running Sores in Children's Heads. It is mixed with 3 or 4 times the quantity of the Juice or Essence, and taken to 4 Ounces at a time, or more, good against the Dropsey, and taken and continued for some time, it kills, and at length cures the Fits of Tettin and Quaran Agest. It also stops all Cures of Fluxes of Blood, as Vomiting, Splitting and Pilling of Blood; and is good against inward Bruises, caufed by falls, &c.

XX. Note. The first is most used because most common; but the second is the most effectual of them all. It is used also to be laid up in Cellars and Premises, to keep Moths from Garments.

CHAP. DCCV.

OF TREFOIL Meadow:

OR,

Field Claver: OR, Clover-Grafs.

Called also,

Meadow Honey-Suckles.

I. THE Names. It is called in Greek Timono-

Meadow; in Latin, Trifolium Pratense,

by all Authors, as being the most common belonging to it, because of its three Leaves always growing together upon one Footstalk; and in English, Trefoil, Three-Leaved Grafs, Meadow-Trefoil, Alkemond-Clover, of Clover-Grafs, and Honey-

Suckles, because Bees gather much Honey from their Flowers.

II. The Kinds. They are very many, but we shall here have respect chiefly to such as grow with us in our Meadows, which are, 1. Trifolium pretense vulgaris purpureum. Our Common Purple Meadow - Trefoil, or Meadow - Honey Suckles. 2. Trifolium Pratense vulgaris album. Our common white Meadow-Trefoil. 3. Trifolium purpureum magnum, Great Purple Trefoil. 4. Trifolium purpureum minus, Small Purple Trefoil. 5. Trifolium album minus, Small white Trefoil. 6. Trifolium album minus, Small white Trefoil. 7. Trifolium Cordatum, Heart-Trefoil. 8. Trifolium paradox, Lagopus vulgaris, Lagopus minor. Common Meadow Horse-Foot Trefoil, or little Horse-Foot Trefoil. 9. Trifolium parvum leucum, Small Yellow Trefoil. 10. Trifolium latifolium minutum, The Smallest Yellow Trefoil.

The Descriptions.

III. The first, or our Common Purple Meadow Trefoil, or Meadow Honey-Suckles. It has a long slender and fibrous or stringy Root, which sends out many Leaves to it, and endures long. It has many Leaves with small Seed in them: Sometimes this is found with half round Spots of white in the Leaves.

IV. Gerard Describes it thus. Its Root is long, woody, and grows deep. It brings forth Stalks a Cubit long, round, and something hairy, the greater part of which creeps upon the Ground, or on which grow Leaves confiding of three joined together, one standing a little from another, of which those which are next the Ground and the Roots, are rounder, but those growing in the upper part of the Stalks, having for the most part in their middle, a white Spot like a Half-Moon. The Flowers grow at the tops of the Stalks in a Tuff, or in a small Fox-Tail Ear, of a purple Color, and sweet Taste, after which comes the Grain or Seed, round and blackish, in little backed Vessels.

V. The second, or our Common white Meadow Trefoil. This differs little, or almost nothing from the former, facing in the colour of the Flowers, for all of those are of a bright Purple, contrariwise, these are very white. The Leaves and Flowers, and indeed the whole Plant, being something less than that; yet this is sometimes found with longer Leaves, that the Heads themselves are larger. There is also another sort, whose Leaves are all longer than the Stalks, and pretty sharp pointed within, whose Flowers are of a little pale Red or Purple, of which kind, the Leaves are sometimes spotted with black Spots.
Chap. 705. English Herbs.

Trefoil white Meadow, Common.

VI. The third, or Great Purple Trefoil. Its Root is roughly long, Reckless and fantastic. It seldom grows much above a Foot, or Fact and half high, having semicircular Leaves thereon, which are Large and long, three always set together on long Footstalls, and pretty sharp pointed. At the top grows large and somewhat long Heads, of pleasing Purple Flowers, like those of the first Meadow Trefoil, but greater. It is also found sometimes with longer and narrower Leaves, and a more split Head of Flowers.

VII. The fourth, or Great White Trefoil. Its Root is long, and about the thickness of an Strick Finger, being fibrous within, Brownish on the outside, and whitish within. The Stalk is not so great, nor so high as the third: The Leaves are smaller and heavier, and something Trefoil White Great, Common.

Spars and it is sometimes found with a Tuff of green Leaves on the Stalks, which is thought to be only accidental, and rather Latus Natura, than any special Kind.

Trefoil Purple Great.

Tris, the fifth, or Small Purple Trefoil. It has a Root which is long, Ground, and Fibrous. Its Stalks are about a Foot in length. Its Leaves are like to the first Common Trefoil, seeing that they are lighter, and of a more pious or dirty red color, always growing in threes together, whole Leaves, and also its Flowers,

VIII. The fifth, or Small Purple Trefoil. Its Root is long, Reckless, and fantastic. Its Stalks are about a Foot in length. Its Leaves are like to the first Common Trefoil, seeing that they are lighter, and of a more pious or dirty red color, always growing in threes together, whole Leaves, and also its Flowers,
Trefoil Purple Meadow, Small.

are in form shape like the Common Meadow Trefoil, but of a Purple color.

IX. The sixth, or small white Trefoil. Its Root is small and thready, and rises up with many Stalks, spread out into several Branches.

Trefoil White Meadow, Small.

grew with us in our Meadows, each Leaf having a kind of reddish, or some other like colored Spot in its middle. The Flowers grow at the end of a Stalk coming from the Joints, which are small and yel- lowish, and after turn into prickly turning Heads, not much unlike to small Medicas, or Clover-Grasfs.

X. The seventh, or Heart-Trefoil. Its Root is small, slender, fibrous or thready, and Annual, which sends forth very slender and weak Stalks, spread out into many Branches, and full of Joints, repeat with round-pointed green Trefoil Leaves, upon long Footstalks, round and broad at their ends, and dentcd in, in the middle of the end, making the Leaf to be in form of a Heart, as it usually

Trefoil Heart.

Trefoil Heart.

and Leaves, bearing small Spikes or Heads of Flowers at their tops, of a white color: Of the Leaves, those below are rounder, or almost quite round, those above are longer and narrower, but all of them smaller than the first or second common Kinds. They grow pretty close together, and are many, the Plant being full of Branches, three for the most part growing together, and sometimes four or more, as Nature is pleased to produce them.
Chap. 705. English Herbs.

Trefoil Hares-Foot, Small.

Common.

Trefoil Yellow, Small.

hairy Stalk, spreading it self out into several Branches, on which grow small Leaves, three joined together, like those of the small Trefolls. The Flowers grow at the very Points of the Stalks and Branches, consisting of a rough Knop, or Buds of Heads, or Dons, like that of Alopecurus or Fox-tail, of a white color tending to a light Blotch, with little white Flowers among the Dons.

XIII. The ninth, or Small yellow Trefoil. It has a small slender and fibrous Root, from whence rise up smooth, slender weak Stalks, about a Cubit high, set with few Leaves on them, which are small and round pointed, and sometimes dented in the middle of the end, small in form of an Heart, (not much unlike to the Common Meadow Trefoil,) each standing generally on their own short Foot-stalks. The Flowers come forth at the tops of their Stalks and Branches, made as it were of brownish yellow Scales, laid one upon another, well referring in an Hop, of which it took one of its Names, viz. Lupinus Sylvaticus. Johnion in Gerard says that the Heads are pretty large and yellow, which afterwards become of a brownish color, and somewhat resembling an Hop, whence Thallium called it Lupinus Sylvaticus, or Tritolium Luteum alterum Lupalinum; but Dodonaeus, Tritolium agraiarium, Field Trefoil. The Flowers being pull away, are followed by many little crooked clover-like Seeds.

XIV. The tenth, or small yellow Trefoil. Its Root is small and threadie, which sends forth a few weak slender Stalks, (but little bigger than small Rudolph) lying on the Ground, on which grow small Trefoil Leaves, sometimes more than three on a small Foot-stalk, and sometimes a very little dented about the edges. The Flowers are small and yellowish, set close and round together, after which follow small, blackish, flat, and crooked Seeds in Heads, almost like a Medica, or Clover. It has two little Leaves at the bottom of the flower, as its Leaves are much smaller than the former, so the yellow Heads are also much lesser.

XV. The Places. There are all Meadow Plants with us, but the third and fourth are shown in Fields and in Holland, and several other parts beyond the Sea, of which they make an excellent Food for cattle, as well to Fatten them, as to give good store of Milk, where they are Manured, they come up rather than they do in our Meadows where they grow WILD and of their own accord; as also on the Mountains and Hills of Spain and Germany. The seventh is said to grow in Arabia, and is by Cometrion called Medica Arabica, but it is common with us in England. The eight and ninth grow almost every where throughout our Land, in dry Grounds, as also among Corn, especially among Barly, and likewise in Barren Pastures in most places.

XVI. The Times. They are fresh and green pretty early in the Spring, and Flower in June, July and August, perfecting their Seed in the mean time.

XVII. The Quality. They are temperate in respect to heat or cold; and dry in the first Degree: Aperitive, Digestive, Amody, Vulnerrary, Diuretic and Aletheaparmit.

XVIII. The Specification. They are used to clear the Eyes-Sight, show Inflammations, and Pains, heal Wounds, help the Stomach, stop the Whites in Women, and refresh the Poison of Venimous Creatures, and cure allsorts of Plagues.

XIX. The Preparations. You may have therefrom:- 1. A Liquid Juice or Elixer. 2. A Decoction in Wine or Water. 3. A Powder of the Seed. 4. A Decoitt Oil. 5. A Cathartic. 6. The Aper of the whole Plant.
The Virtues.

XX. The Liquid Juice or Eflence. Taken to or & Spoonful, they open Obstructions of the Vessels, cleanse the Bowels of slimy Humors which stick to them, help against the bitings of Vipers, and other Venemous Creatures; provoke Urine, give ease in the Strangury, stop the Whites in Women, as also Fluxes of the Belly, after it has cleansed it. It heals Wounds by washing with it, cools Inflammations, and eases Pain. Drop into the Eyes, it allays the heat, takes away the Blood, dirt, and cleans them of any Film which begins to grow over them.

XXI. The Decotion in Wine or Water. It has all the former Virtues, but as it is weaker, must be taken to half a Pint or more, Morning, Noon, and Night.

XXII. The Powder of the Seed. Pours it is of to powerful a drying and bindingEffect, that well wonderfully stops the Running of the Reine. Dose from a Dose to two Drains, Morning and Night. It is also probably used in all foul and hollow Ulcers, being first cleansed to incrust, and then to excrurate or heal them. It is also laid to be good against Ruptures, and cure spitting of Blood.

XXIII. The Decocted Oil. It is made of the whole Plant. It is good against recent Consumes, the bitings of Serpents, or any other Venemous Creature; abate Inflammations, ease pain, and difcuss Tumors being applied.

XXIV. The Cataplasm. Applied to the Share, it allays Inflammations thereof, and eases Pains in any part. The Herb being bruised, and heat between two Pewter-plates, and applied hot to the Share, it is laid to cause them to make Water in a Strangury. It softens Tumors and recent Contusions, and cures them. Also applied to the bitings of a Viper, or other Serpent, Mind Dog, &c. It is laid draw out the Poisins, and prevent further mischief.

XXV. The Affections of the Heads. They are good to apply to the Hemorrhoids or Fists, to stop their Bleeding, and ease the Pain. And have also been found profitable, being applied to a Frowardness of the Mind, or falling out of the Fundament.

CHAP. DCCVI.

Of TREFOIL Coddled: o r.

Pease Clover.

I. THE Names. It is called in Greek, Τρεφολιον, αλάθειον; in Latin, Trifolium Silquiflumin; and in English, Coddled Trefoil, Pease Trefoil, or Pease Clover.

II. The Kinds. Of this Plant we shall take notice only of these following, viz. 1. Trifolium Siliquiflumin major, the greater Coddled Trefoil.

2. Trifolium Siliquiflumin minor, The lesser Coddled Trefoil.

III. The first, or greater Coddled Trefoil. Its Root is long and reddish, branched and fibrous. It rises up with a Stake or Post two high, which is forced out into many Branches, which set with Trefoil-Leaves, upon short Footstuffs, small and sharp pointed, very little differing from the Common Trefoil Codded, Greater.

Meadow Trefoil, (with leafy Leaves growing at the bottom of the Footstalk) but in their Magnitude, these being very much left, and of a greenish yellow color. The Flowers are in small Tufts or Heads, of a yellow color, not much unlike to those of Broom, but differing, after which come several Seeds, four or five, more or less, in which is contained round Seed. Both the Stalk, Branches and Leaves, have a little soft Down upon them, and the Flowers grow clustering together on the tops of the Stalks, which being pulled away, the Seeds succeed.

IV. The second, or lesser Coddled Trefoil. This in its Stalks, Branches, manner of growing, is very much like the last described, but the Leaves are much less, the former being four times larger than these. These Leaves as they are so much left, being also shorter pointed, so they grow also upon shorter Footstuffs, having two single Leaves growing out below them, at the bottoms of their Footstuffs, they all of them having a little soft Down upon them. Their Flowers come out one of the tops of the Stalks and Branches in a Tuft or Cluster, being of a yellow color, and almost like those foregoing, seeing that they are lesser, and fewer in number, being generally but 2, 3, or 4, set succeeding them, in which is contained the Grain or Seed, not much unlike the former.
Trefoil Codded, Lesser.

V. The Places. They are all of them found growing in our Fields and Pastures, as such as are Fertile and of good Soil, almost everywhere.

VI. The Times. They all flower and seed from May, to the end of Summer.

VII. The Qualities, Specification, Preparations and Virtues, are the same with those declared in the last Chapter, to which you are referred; so that no more need to be said of them in this place.

CHAP. DCCVII.

Of TREFOIL MARSH:

OR

BUCK-BEANS.

I. The Name. It is said to be the Monstrif, or Monstros Thistelgrass, by which the Latins call Trifolium Palustreum; Trifolium Pasture, Trifolium Vivacium; also Trifolium Liberum Stabroescus, Trifolium Ldspontaneum; Trifolium Tuberosum, Trifolium Lutulentum; In English, Marsh-Trefoil, and Buck-Beans.

II. The Kinds. Tuberosum makes two kinds heretofore, viz. 1. Trifolium Palustreum vel Pasture major, The Greater Marsh-Trefoil, or Buck-Beans. 2. Trifolium Palustreum vel pasture minor, The lesser Marsh-Trefoil or Buck-Beans, whole Descriptions follow.

III. The fifth, or greater Marsh-Trefoil, or Buck-Beans. Its Root is long and slender, creeping in the Mud all about, and shooting up of itself or its several joints. It rises up with a spongious flexible stalk half a Yard high or more, with several smooth thick and somewhat broad dark green Leaves set thereon, at far distances, three always standing together on a long Footstalk. From the middle of the Stalks up to the top, come forth a long Bough or Spike, of five pale yellow Flowers, each of them containing of five round pointed Leaves, with a long thick pointed Umbone in the middle, which together

Trefoil Marsh, Greater.

OR

BUCK-BEANS.

with the Leaves theirsef, are covered with a fine hairy Down or Wires, which adds a greater beauty to it, which after they are full, small round Heads come in their places, containing in them brownish yellow bitter Seed.

IV. Gerard describes it after this manner. Its Roots creep divers ways in the Marshy Ground, being full of joints, white within, full of Pores and spongious, sending forth several by Shoots, Stalks and Leaves, by which means it much increasest, and largely multiplies its self. This great Marsh Trefoil has thick fat Stalks, weak and tender, full of a spongious pulp, very fowth, and of about a Cubit long, on which grow Leaves much like to those of the Garden Bean, set upon long Footstalks, three together, like in manner to the other Trefoils, smooth, hairy, and of a deep green color. From among which, towards the top of the Stalk, grow out

The Descriptions.
out a Bath of water like flowers, of a white color, dyes over gently with a Walk of light Cornation, after which follow the Seed, contained in small Buttons, or knobby Buckles, of a brown yellow color, like unto Miller, and of a bitter Tinge.

V. The second, or larger Marth-Trefoil, or Buck-Bean. It differs not in its Roots, Stalks, Leaves, Flowers, Seed, and manners of growing, from the former or greater kind, but only in its Augment, this smaller Species (if it be a different sort) being only less: But some Authors think, and I am almost of the same Opinion, that they are both of them, but one and the same Plant and Kind; and that the difference between them of greater and lesser, arises chiefly from the Clime or Country, place of growing, and quality of the Soil.

VI. The Places. Marth Trefoil grows only in wet and marshy Grounds, and will not thrive out of them, but will quickly grow rank and wither; and therefore is to be sought for in Marsh and Fens places, and may be found in a boggy Soil, almost every where.

VII. The Times. It flowers from June to the end of July, and sometimes in Augst, the Seed ripening in the mean Season.

VIII. The Qualities. It is hot and dry in the first Degree, Aperitive, Adherent, Diuretic, Amody, Pelosif, Hepatic, Splenetic, Nephrick, Artlicick, and Hypurick.

IX. The Specification. It is an experimental Preparative, and Cure of the Gout and Rheumatism, whether in Old or Young; opens Obstructions of Stomach, Lungs, Liver, Spleen and Worms; relieves Hypochondrick Melancholy, and is excellent against Althma’s, Coughs, and other Diffemperers of the Lungs.

X. The Preparations. You may make there-from, 1. A Liquidge Juice or Essence. 2. A Syrip of the same. 3. A Decoction, or rather Infusion, in Wine or Water. 4. A Poudre of the Seed.

The Virtues.

XI. The Liquidge Juice or Essence. Taken inwardly from 3 Spoonfuls to 6, in any convenient Vehicle Morning or Night, for some considerable time, it decays the very Essence of the Gout; it not only cures Gout and Rheumatisms but is also a Preparative from the same, and prevents their return again; this Plant being found to be the greatest of all Simple Vegetable Alternative Preparations, for the curing our outh Difices. The Essence cures Hypochondrick Melancholy in Men, and Vapors and Fits of the Mother in Women, and powerfully opens all Obstructions of the Viscera, chiefly of the Stomach, Lungs, Liver, Spleen, Melenctery, Reins and Worms; and therefore is a remedy against the Difices of those parts caused thereby; for by removing the Obstructive matter, and softing the Tons of the Bowels, it quickly brings Health to such Diseased Bodies. These Preparations have been found also experimentally good to stop a spitting of Blood.

XII. The Syrip of the same. It has the former Virtues, but is chiefly adapted to Obstructions and Diffemperers of the Lungs, as Althma’s, Coughs, Colds, Hoarfords, Phthisik, Wheezings, etc. of Vomit, Gc. being given for some considerable time, Morning or Night, as before directed.

XIII. The Decoction, or rather Infusion in Wine or Water. It has all the Virtues of the Juice, Essence and Syrip; but if it is given against the Gout, Rheumatism, Melancholy, and such like Diffes, it ought to be made in Water; but if against Diffes of the Stomach, Melenctery or Reins, in White Port or Lisbon Wine. It may be given half a Pint or more at a time, Morning, Noon, and Night, either simply alone, or dulcified with Sugar, as the Patient likes best.

XIV. The Poudre of the Seed. It may be given from two Spoonfuls to a Dram or half, or four Spoonfuls, mixed with Syrup of Assafin, or Syrup of Hyflis, or for want of them with a little choice Honey, Morning, Noon, and Night, against Althma’s, Coughs, Phthisik, Hoarsness of Breath, difficulty of breathing, and out of Diffes of the Breast and Lungs, for it cures tough Elegion and gros Humors, and makes them easier to be expellated; thereby cleansing the Stomach, Lungs, Liver, Spleen and Melenctery, and strengthening them withall against their Habitual Weakneses.

CHAP. DCCVIII.

of TREFOIL Pease.

I. THE Names. It is called in Greek, ἑμηρή, in Latin, Lotus, and in English, Pease Trefoil.

II. The Kinds. Dyscrorides and Galen make two Kinds, the one named Lotus Mortalis, which is our Trifolium matricaria, Trifolium Odoratum, Sweet or Garden Trefoil, of which we have already discoursed largely in Chapt. 704. The other to be named, Lotus Sylvestris, Trifolium Sylvestre, The Wild Lotus, or Pease Trefoil, of which we shall treat in this Chapter.

III. The Kinds of the Pease Trefoil. Authors make the half part of twenty Species of them, the most of which are perfect Strangers in our Country, and not to be seen of us (unless a great Traveller) in many Ages. We shall only take notice of such as grow either in our Gardens, or Wild abroad in the Fields, which are the six following, to wit, 1. Lotus edulis Creticus, Lappusfam Pone, Lotus Cratica Balduino, Trifolium Fish Gentus, The common Candy Pease Trefoil. 2. Lotus Pijatus major, Trifolium Hemorrhoidale major. The greater Pease or Pile Trefoil. 3. Lotus Pijatus minor, Trifolium Hemorrhoidale minorius. The lesser Pease or Pile Trefoil. 4. Lotus corniculatus Frances, Trifolium flolium Corniculatum. The common or small Trefoil. 5. Lotus corniculatus caninus, Trifolium corniculatum vulgatififolium, The common hoary Trefoil. 6. Lotus Siliquadactylus, vel Siliquus Quadriplanetti, Trifolium Siliquosum Flora rubra, Cramino, or square Coded Trefoil.

The Descriptions.

IV. The fifth, or common Candy Pease Trefoil. Its Root is small, Ebroous and Annual, which shoots forth several tender Stalks, set with broad deep green Leaves of several directions, three always growing together, or a Foot high, which are foppiz, a little thick, and pointed. The Flowers are yellow, but the unto small Pease Blossoms, which are succeeded by roundish Cods a little crooked, and are great in respect to the smallness of the Viscera, in which are contained round Pease of a sweet Taste, like
like to our ordinary Peas, which whilom they are young and green, are usually sold in their Markets, and as much desired of them, as our Peas are by us. The Stalks and Leaves, being all hearthy, are a little hairy.

V. The second, or greater Pea, or Pike Trefoil. Its Root is long, straight, and something woody with a few fibres adjacent to it; from whence rises up usually but one Stalk, two or three feet high, spread out into several hard, white, flexible Twigs, and they again into other smaller, bearing at every Joint a few Leaves, two of which hand close to the Stalk, each upon a small Footstalk, and the other three rise up between them higher than they, upon another Footstalk like a Trefoil; the Leaves and Stalks being all hearthy, yet in the younger Plants only the three Leaves stand together on a Footstalk, without the other two at the bottom. The Flowers grow many together in a Tufa, of a bluish or white red color, somewhat large, which turn into round Cods, greater and thicker than the next following, and are of a blackish red color, something fainder as it were, representing on a more near the Hemorrhoidal Cod, as it appears where it is fouled and fallen down, (whence come its latter Name,) or else from its singular Virtue which it has in curing the Piles, within whose Cod are contained small blackish Peas or Seeds.

VI. The third, or lesser Pea, or Pike Trefoil. Its Root is a little thick and woody, full of Fibers or Strings, from whence rises up a Stalk two or three feet high, and others, with two or three fainder large Leaves, both for close to the Root of every Branch, and to the Joints where the Leaves grow, from whence come forth other Leaves as large as the ordinary Trefoil Leaves, three standing together upon a long Footstalk. The Flowers grow in Tufa at the ends of the Branches, of a light bluish color, which are followed by small, round, and shorter Cods than the former, and much such like Peas or Seed in them. This Plant dies yearly with us; but in a kind Terre grows us ripe Seeds.

VII. The fourth, or Baffy horned Trefoil. It has but small smooth green Stalks a Foot or more high, spreading it self out into many small and short Branches, almost like a Baffy, with Trefoil Leaves on one side, and Footstalks, the Leaves being long and narrow. The Flowers are yellow, flowering forth at the tops 2 or 3 together, and sometimes more. After which come thicker and shorter Cods than in the foregoing, ending in a long point, in which are contained small Peas or Seed. Sometimes it has broader Cod, and ends in shorter Points, as it generally does with us.

VIII. The fifth, or the hairy horned Trefoil. It has a slender woody fibrous Root, which sends up slender Stalks covered with very small reddish hairs, which are fit with small hairy sharp pointed Leaves, three on a Footstalk, and two below at each Joint, from whence springing the Flowers, one or two at the mall on a small Stalk like an Hair, of a deep yellow, tending to a Saffron color, after which follow very slender Footstalks, containing very small Seed.

IX. The sixth, or common hoary horned Trefoil. This is but a less Pike, but has a little larger Leaves and Flowers than the last, and of a deep Saffron yellow color, or rather with a Shadow of Crimson on them, growing three or four together; which being faded away, small, crooked Cods succeed, containing within them rare Peas or Grains.

X. The seventh, or Crimson Baffom, or Square Cuddled Trefoil. Its Root which is small, and perishes every Year, sends up three or four small weak Stalks, divided into many Branches, having two Stalks of Leaves at every Joint, and three small Foot Trefoil Leaves standing together on a very small Footstalk, coming from the Joint. The Flowers grow for the most part two together, of a perfect red or Crimson color, almost like to a Pea blossem. After which come long, thick, and running Cod, with two Skins or Shells, and running Cod all along the Cod on the upperside, and two other such like Fibers all along on the Cod on its under-side, which makes it seem four Flowers; in which Cod are contained round discoloured Peas, a little smaller and better than our Common Peas.

XI. The Plants. The first is a Native of Cor-
dy, in growing among their Corn, and in the Bor-
ers of their Fields, but with us it is only Nurtur 
up in Gardens. The third is a Stranger, and only a Garden Plant with us. The seventh is a Garden Plant also, and we Cultivate it chiefly for the Beauty of its Flowers. The second, fourth, fifth and sixth, grow Wild, and are often found in many of our Fields or Meadows.

XII. The Times. They Flower in the Summer Months, in June and July, when the other Tre-
foil Flower, and their Seed is ripe in the Month following, or not long after the falling of the Flowers.

XIII. The Qualities. They are all Temperate in respect to the fifth Qualities, Aperitive, Adstringent, Diuretic, Nephritick, and Lithoboricstic. The Pike Trefoil is a Sudorific and Diuretic.

XIV. The Specification. This is a Naratemporal, and retorativo in Confumptions. The Pike Tre-
foil is approved for curing the Hemorrhoids or Piles, but all the Species open Obstructions, cleanse the Urinary passages, and are profitable against Sand, Gravel, and Stone in the Reins and Bladder.

XV. The Preparations. You may have from the fifth and seventh, 1. A Pottage of the Puffs, or kind of thick Pottage. 2. A Direction of the same in Water. 3. A Decoction of the Grains of all the other Kinds, as sale of the whole Plants in Water.

XVII. The Decline of the Puffe of all these Kinds, or of the whole Plants in Water. Let it be made very strong, and then mix with a half part of White-Poore-Wine, and drink it. It opens Ob-
structions of the Urinary parts, helps the Sto-
urgy, and cleanseth those Vellids from Slim, Sand, Gravel, Stones or Tarratious matter lodged in them, being often used.

XVIII. The Powder of the dried Herb of any of the Kinds. It may be given from half a Dram to a Dram and half in White-Wine, for all the purpo-
ses aforesaid. The Powder of the Pike Trefoil given
Salmon's Herbal.

Chap. DCCIX.

Of Trefoils, Strawberry, and Starr.

I. The Names. We know no Greek Names belonging to these Plants: The first called in Latin, Trifolium fragiferum, and in English, Strawberry Trefoil. The second tho' not mentioned by any Greek Authors, may be called Telesphorus pedunculatus, in Latin, Trifolium Stellatum, Trifolium Stellatus, in English, Starry Trefoil, and Starry-Headed Trefoil.

II. The Kinds. Of the first or Strawberry Trefoil, we have but one Kind growing with us, viz.: Trifolium fragiferum Gerardi, Trifolium fragiferum Telfus, because it also grows in Frieland, and some call it Trifolium Viscidum. The second is called, Trifolium Stellatum glabrum Gerardi, Trifolium capitatis Stellati, smooth Starry Headed Trefoil.

The Descriptions.

III. The first, or Strawberry Trefoil. Its Roots spread themselves with many long Fibres, and it grows up with several Stalks and broad pointed Trefoil Leaves upon them, being detained, in the middle of their broad ends, making each Leaf in form much like a Heart, or not much differing from the Leaves of the Trifolium Cornutum, or Heart Trefoil, growing upon long Footstalks, which Stalks are bare towards the tops, where grow small round Heads, with small blish Flowers, rising out of their Heads, which are like small Blisters made of thin Skins, after the Flowers are past, these Blisters swell somewhat bigger, and turn down their Brim, forming a Head like a Strawberry, of many red Grains set together, but greater in each Head, wherein is contained a few small yellow Seeds.

IV. Johnson in Gerard, describes it after this manner: The Roots, Stalks and Leaves, of this pretty Trefoil, do not much differ from the common white Meadow Trefoil, but there is some difference in the Flowers and Seed: For the Flowers of this are small, grow thick together, and are of a whitish blish color, after which follow Heads made of little Blisters or thin Skins, in such like manner as they resemble a Strawberry or Raisberry; and they are of a greenish color, here and there marked with red: The Leaves are shaped in form of a Heart, and the Stalks seldom grow above a Hand breadth, or four inches high.

V. The second, or smooth Starry Headed Trefoil, for there is a rough sort of it growing in Spain, not much differing from this, but it is an oblong Strangler with us: It has a small long white Root, with several Fibres adhering to it, from which rise up Stalks sometimes a foot high, and sometimes very much shorter, hairy, and divided, but into few Branches: The Leaves which are of a Trefoil fashion, stand upon long Footstalks, and somewhat lengthen together, (but those which grow in France, are found to be in form of an Heart,) having no small sharp pointed Leaves growing at the bottom of the Footstalks, next to the Stem of the Plant: The Leaves are green of color, and not flat, but smooth about the edges. The Heads which grow on the tops of the Stalks are round, and green, with small purple, or elfe white blish Flowers, like those of the Common Trefoil, but latter, standing in Cups divided into five parts, viz. into five long sharp Leaves, which lying open, do very much resemble the Form of a Star. The Flowers being fallen, the Heads grow somewhat bigger, broader, and more prickly, opening themselves a little, but not much. The Seed is like that of Miller, but somewhat rounder.

VI. The Places. The first grows in Frieseland, in the Low Countries, and other places adjacent to them, as well as with us. It grows here in most Salt Marshes, as in Dursford Salt Marsh in Heref., and in those below Purfleet, and the like places. The second Johnson observed in Dursford Salt-Marsh;
Marsh, and have seen them both in several other parts and places of this Kingdom.

VII. The Times. The first Flowers in July and August, and the Seed is ripe not long after. The second Flowers in June and July, and the Seed is ripe in July and August.

VIII. The Qualities, Specifications, Preparations and Virtues, are the same with the Common Medico Trefoils, in Chap. 709 following, to which we refer you, to that no more need be said of them here.

CHAP. DCCX.

OF TREFOIL Tree:

OR,

Cytisus; and Bean Trefoil.

I. THE Names. It is called in Greek Κωλόμηλος: 
in Latin Cythis, & Cymo Infula, as Pliny says, and in English Tree Trefoil.

II. The Kind: Authors make 15 or 16 several Species of this Plant, most of which are perfect Strangers to us, and not to be seen unless we Travel many Foreign Countries: we shall only describe such as are Natift up in our Gardens, which are the five following, viz. 1. Cytisus Diascoriades & Galeni, Cytisus Maranth, (so called because it was first brought to light by one Bartholomaeus Marantha of Naples:) 2 Cytisus Cornutus, Cytisus Lanatus & Cytisus crassus. The true Tree Trefoil of Dioscorides and Galen, or Horned Tree Trefoil.

III. And because the Bean Trefoil is a Tree Trefoil, tho' it be no Cytisus, we shall add it to the rest in this place, to avoid making a New Title or Chapter. It is called in Greek, 'Ανάγυρις Νικήν, in English Bean Trefoil, or Tree Bean Trefoil, and this is twofold, viz. 1. 'Ανάγυρις non fortis major, five Lathurnus major, The greater Tree Bean-Trefoil. 2. 'Ανάγυρις non fortis minor, five Lathurnus minor, the lesser Tree Bean Trefoil. As for the Angyris furida, we have nothing to say to it here, because it grows only in very hot Countries, and so is a perfect Stranger in our Climate.

The Descriptions.

IV. The first, or True Tree Trefoil of Dioscorides and Galen, or Horned Trefoil. Its Root is hard and woody, running out several ways under Ground: It rises up to be 4, or 5 Feet high or more, (according as it likes the Soil) the Stalk bring as thick as

Trefoil Tree, True.
Salmon's Herbal.

Leaves of the Tree Bean-Trefoil. At the ends of the Branches for the most part, come forth the Flowers, three or four together, of a fine Gold color, and of the fashion of Broom flowers, but not so long. After the Flowers are poll in their places come crooked, flat, thin Cods, in form or shape of an Half Moon, or Crooked Hams, whith or when they are ripe, in which is contained Blackish Seed, the whole Plant has a pretty hot smell, but not strong. Gerard says, That its Branches are tough and hairy, that the Leaves are like those of the Meadow-Trefoil, that the Cods or Buds look like a Sickle, that the Seed or Grains take the color of Chick Pea, that the whole Plant is hoary like Khusus or Backthorn, and that being broken or bruised, it smells like Roebuck.

V. The second, or common Tree Trefoil. Its Root diversely spreads it self under ground, from whence arises a Stem or Stalk, larger both in height and thickness than the former, having a blackish coloured Bark, replenished with Trefoil Leaves, but smaller and greener than the former. The Flowers are smaller, but of the same fashion and color. The Cods are blackish and thin, not very long or great, but better than Broom Cods, in which is contained small blackish Seed. Gerard says, That it grows to the height of a tall Man, (but that is as the Soil is in goodness.) That the Leaves are like some of the Common Trefoil, but smaller, of which the middlenook of the three is always the longest, that the upper side of the Leaf being green, the under side is somewhat reddish and hairy, that the Flowers grow on the Stalks a yard or two above their bottoms to their top, but greater than any of the rest, of a Gold yellow color, Broom fashion, and that the Seed has a Cicer, or Chick-Peas fashion.

The third, or common Trefoil.

Its Root is woody, running it self out under the Earth many ways, from which rises up several slender hoary Stalks, which are but low, and more Woody than some others, with long Trefoil Leaves, which in several places of them, are on the backbone somewhat more hairy than on the upper side, the middle Rib being somewhat great, of a kind of smaller Trefoil, and a little feeter in Smell also. The Flowers are of a Gold yellow like the other sorts, and like Broom Flowers, standing many together, one above another at the ends of the Branches. After which comes hoary, and somewhat hairy, little, long, narrow, and flat Cods, containing therein small Seed like that of Broom, talking like Tares. Gerard says, that its Stalks and Branches grow not very high, but are plentifully forced out round about, that the Leaves are greater than the former, but feather than those of Meadow Trefoil. That the Flowers grow close together, as they were bound up, or compait into one Band, or fancy Tafts, somewhat greater than the former, but the Cods are also greater and more hoary, that it falls out to be more hoary or woolly in one place than in another, and the more hairy and woolly it is, the whiter it grows, and that the Branching of this often goes upon the Ground. Johnston says, That the Leaves are smooth and green above, and hoary underneath, that the yellow Flowers when fading, become somet- times Orange coloured, and feem, also in Candy, and Seeds broonish.

VII. The fourth, or Sainth Tree Trefoil. Its Root is woody and fibrous, spreading it self abroad, which sends up usually but one Stalk, rising to a Man's heigne, and covered with a dark greyish Bark, which spreads it self out round into Branches, which are replenished with small pale greenish Trefoil Leaves on the upper side, and a little reddish and hoary underneath. The Flowers are of a Gold yellow color, somewhat longer than others, and coming forth at the bottom of the Leaves in several places, commonly two or three at a place, which have in them a white or yellow Seed, a little bluish than Broom Cod, and somewhat blackish when they are ripe, containing within them small, flat, and blackish Seed, as small as that of Broom.

VIII. The fifth, or small yellow Trefoil. Its Stalks and Brancher are not above half a Yard high, long, slender and hoary, repeat with Trefoil Leaves, the two lower of which are smaller than the rest, on a half, which is of twice their length, but of a hoary Afb color, standing on short Footstalks, of an Aftrellng drying Taft. The Flowers come forth with the Leaves at the joints, all along the Branches two or three together, which are saffroned by hoary yellow color, whereon they stand. Gerard says, That it grows to the height of a Cult more, that it has many Branches which are slender and twigg, like Broom, streaked and very hoary, that the Leaves are Trefoil like, or very like Fenugreek, yet all hoary; that from the boomes of which, or between the Leaves and Stalks, the yellow Flowers come forth, very hoary Broom or Pale Flowers, but smaller; that the Cod are like Broom Cod, of an Afb color, but slenderer, rougher and fatter; that in their several Cods are contained bright shining Seed, like the black Seed of Broom, and that the whole Plant is like hoary like Khusus or Backthorn.

IX. The fist of the Greater Tree Bean-Trefoil. In its Root is woody, runs deep into the Ground, and is covered with a hoary yellow color. The Branches are very long, plant, and bend the one in the other. The third, or common Trefoil leaves upon long footstalks, being something long, narrow, and pointed at the ends, green on the upper side, and of a Paining Silver color underneath. As the Joint of these Branches where the Leaves fold, comes forth many Flowers much like those of Broom, but not so large or open, growing about a very long Branch or Stalk, sometimes a good Span or more in length, and of a fayr yellow color, but not very deep, after which comes flat this Cods, not very long or broad, but in tough and hard as those of Broom, in which are contained blackish Seed; These Seeds of Flowers hang down, and do not stand up, being as much a Foot long, as do also the Cods. Gerard says, that the Leaves are rather like to Vixen, or those of Cyrtus, and that the Seed is like that of Galge, or Tree-Trefoil.

X. The second, or sainth Bean-Trefoil. It is in most things like unto the last describ'd, but it grows nothing near so great, nor are the Leaves so large by half, nor yet either the Flowers or Seed. XI. The Places. The fist four of the Tree-Trefoils are found in the Kingdom of Naples, and several parts of Greece, as also the second, third and fourth in Hungary, Austria, &c., but the fist five are Strangers in England, but as they are nurth up in Gardens; the secon of them being the most common with us. The Tree-Trefoil grows in Spain, as well as in Italy, where the Cods, it is said, are the most hoary, yet some
Chap. 710. English Herbs. 1179

Chap. DCCXI. Of Tufts Garden.

I. THE Names. This Plant is called in Greek, 

Omnôs, of sòma húxón, and Ὀμνοράμοος; in Latine, Thelóphi Hortentif, or Thelóphi Umbellátum: in English, Garden Tufts.

II. The Kinds. We observe but two sorts of this Plant in our Gardens, viz. 1. Thelóphi Criticun, Thelóphi Umbellátum, varae albæ & purpurae, Candy Tufts white and purple; it is a Flower of the large kind, and serves for an Ornament to great Parterres. 2. Thelóphi Baticum, Thelóphi Marínum, Spanish Tufts, or Spanish Sea-Tufts.

The Descriptions.

III. The frith, or Candy Tufts, white and purple. Its Root is small and thready, it is like that of the Treacle Mustard, enduring many Years, which bears up Stalks about a Foot or more high, divided or spread out into several Branches, each of which bears Leaves of about two Inches long, without Flowers, large at bottom, indented round the edges, and pointed at their tops. At the upper end of its Stalk grow very small Flowers, composed of four Leaves, in the form of a Cross. In the middle of each Cup are fary Style, which becomes a Fruit, round at top, bordered with a Wing or little Leaf, and divided into two Chambers, which are filled with flat Seeds, that at first are red, but afterwards when they become ripe turn black.

IV. The second, or Spanish Sea-Tufts, are very much like the former, which bears forth some Leaves (before its Stalks,) which are a little whitish or finely dent'd about the edges, but it divides or spread out into Branches as the former does, but at its top an Umbel of purplish Flowers like unto the former, but with paler yellow Seed.

V. The Places. The frith grows in Candy, the second in Spain, not far from the Sea-side, but with us they both are Nurset in Gardens.

VI. The Times. They flower about the middle or end of June, or beginning of July, and the Seed is ripe not long after.

Observations.

VII. Obs. 1. This Plant (of which there are many sorts, but) two Kinds of which we Sow only in our Gardens, is propagated by its Seed which is Sown in September, in open Grounds, or in hot Beds: It is sown in Drills, on the edges of our Beds or Borders, or else in little Circles, at one, two, or three Feet distant, to make a show the first Year, after which the Plants produce their Seed and dye, and are accounted hardy Annuals.

VII. Obs. 2. If you Sow the Seed in open Ground, it ought to be upon a Bed well dug, and set out by Lines, which should likewise be farer, and with about an Inch thick, and laid afterwards very even. After having drawn Kils length-ways and cross-ways, you may Sow the Seed, yet very thin to the end, that your Flowers may be the finer, and not subject to fade.

Thus...
Salmon's Herbal.

Chap. DCCXII.

Of the Tuberose.

I. The Name. Toth it has no known Greek Name, being an Indian Plant, yet being thought to be of the kindred of the Jacinth, it may properly enough be called 

In English, Tuberose, so called because its Root is Tuberous.

II. The KIND. It is the Opinion of almost all Authors, that it is a Species of the Jacinth, but whether it is the American Jacinth, of which we have discoursed before in Chap. 391, is very much to be doubted, because of the difference which seems to be in the Flower, as also in some other particulars. Besides, Authors describe two Species of that Plant, whereas this seems to be a singular of its own kind.

The Description.

III. Its Root is thick and Tuberous, which grows occasion to its Name, with some Fibres or Strings issuing from it: From this Root shoot forth several Leaves, about half a foot long, broad, smooth, and pointed at the end, in the middle of which rises up a Stem, three or four feet high, and about the thickness of a little Finger. On the top of this Stem or Stalk, the Flowers come forth like Lilies, single Laved, and shod like a Pipe or Bell, pointed, or notch'd in for places, and looking about like a Bell. At the bottom of the Vessel rises a Chime, which in time becomes a roundish Fruit, full of Seed of the same color.

IV. The Places. It is said to be Originally an Indian Plant, but now almost all Europe is florid with it. It is brought to us in the Koots, generally out of Italy, where they thrive and prosper exceedingly, which when we have them, we only Plant them in Pots, and to place them in our Gardens, that they may be hosed in Winter, or when the Season grows cold.

V. The Time. If the Season is warm and temperate, the Root is Plant'd in February or March, and then will they flourish in Flower in June, July, or August, but if you Plant them in May, they will then Flower in Autumn. viz. in August or September.

Observations.

VI. Of 1. The Tuberose delights wonderfully in heat, for which reason, it never bears so large Flowers in our cold Countries, as it does in its Native Quarter Climates, where we are told we ought to repeat it in such Places where the heat or Sun is more freely felt.

VII. Of 2. Chafe such Roots as are hard and firm, which you may know by feeling them with your Thumb and Fore-finger, refusing such as are soft, and incline to be rotten, which is discerned by running your Nail into the side of the Root; if the Substance is not white, reject it, and chase others.

VIII. Of 3. Then chafe middle sized Pots, which fill (within 2 inches of the tops) with Earth made of two thirds of Mould, and one third of Kitchen Garden Earth well mixed together, in which let the Tuberose Roots an inch deep, leaving the other part, which cover with pure Mould, to receive the heat of the Sun, which will by this means the more easily penetrate to the Roots.

IX. Of 4. If you would have early Flowers, plant them in the latter end of February, or beginning of March, and place their Pots in hot Beds until the Pots may be open, and cover them with Glasses; letting them enjoy (if the Weather is mild) the Beams of the Sun thro' the Glasses, but if Freezy or Cold, then cover the Glasses with Mats; And if the Weather be extremely hard, cover the Malls with Straw, for the least Cold imaginable hinders their Growth, and may make them to fail, however well they are disposed to bear Flowers.

X. Of 5. Thus managed, their Shoots will show what they will be, three months almost alone, it
it is that makes them prosperous; but some Mode-
ificare will also be requisite, and therefore it will be
necessary from time to time to Water them, (as your Prudence shall direct) with Water newly
drawn out of a Well.
X. Obs. 6. The Glaffes must be continued, till
the Air is grown warm or mild; nor must the Pots be
yet taken out of their Beds, which prefer a
certain Warmth within them, which has an admi-
nable influence upon them, in causing them to
flourish.
XII. Obs. 7. If you have no Dung, and are
loth to be at the charge thereof, you must not
Plant your Tuberefe Roots till the end of March,
or beginning of April, for the great Cold being
then over, many inconveniences of early Planting
will be avoided. Then fill the Pots in the manner
before prescribed, and Plant your Roots therein,
where Pots expose to the mild Sunny places, let-
ing them upon Boards under a Wall, that they
may have the revivification of the Heat from the
Wall also, which will make them the sooner come
to their full Perfection.
XIII. Obs. 8. If you Plant them in May, then
your Plants will Flower in Autumn, but you must
observe the fame Method as you do in thefe which
are more early Planted, always placing them where
the Sun shines on them, and forwarding them in their
growth, you must Water every day at Noon,
with Water warmed in the Sun.
XIV. Obs. 9. This Plant is not to be raised in
open Grounds, because the Heat in our colder
Climates is not fufficient to make them grow and
thrive as they ought, but being Planted in Pots as
before directed, they are to be exposed to the Solar
heat, yet some do not only expose them to the
strongest heat they can in the Day time, but also
put some Glaffes upon them to retain the Heat the
longer.
XV. Obs. 10. If it happens that some Roots flow-
or up their Stems to loo as others, you must re-
move the Pot out of the hot Bed it is in, and rot
it in another hot Bed newly made, (provided it has
dilfcharged its felf heat,) or for want of fuch a
Bed, to place it on a heap of Horfe-Dung moder-
ately warm, which expedience has been found very
well to succeed.
XVI. Obs. 11. When the Stems grow high, and
the Flowers begin to appear upon their tops, you
must support them with a little Rod or Stick, of a
Finger thick, and of the length of the Plant; but
be not afraid to put them into the Earth, near the Foot of each Plant, to which the
Stems are to be tied, for otherwife the weight of the
Flowers would make them exceedingly to bend, and
probably afio to break: When they begin to
blow, each Flower blosfes faccidently one after
another, which keeps them a long time in Flower-
ing, the Smell and Odour of which is very
favour and grateful, Performing the place or room
in which they grow or are placed.
XVII. Obs. 12. This Plant is multiplied by
Suckers, but this is chiefly done in hot Climates,
for here we look never to carefully after their
Suckers, yet their Stems in (our cold Climates,) will never grow high as thofe which are Planted
from their Original Roots, brought to us out of Italy,
and other Countries, nor will their Flowers be fo numerous or fo beautiful, where-
fore it is a folly to think of augmenting of their
numbers this way.
XVIII. Obs. 13. Loffly, Authors have laid no-
thing of their Virtues, but only fuppofe them to
have the fame Qualities and Specification with
the other Hyacinths: But the great Care and trouble
in their Cultivation, is chiefly for the Beauty of
their Flowers, and their Fragrant Odour, with
which they replenffh the places of their abode.

Chap. 12. English Herbs. 1181

Of the Tulip, or Turk's-Cap.

I. The Name. It has no Greek nor Latin
Name, that we know of, but Authors have
Latinized a Name for it, and call it Typical, from
the Turkish Word Tulipan, which is the Name
the Turks give their Head-Bera, or Caps, and
we in English, in conformity to this Name, call it
the Tulip, which is much like a Turk's-Cap.
II. The Kinds. Some as Podonores, and
Mothefcarus upon Difcorides, refer it to the Word,
or Word Theophrastus, in lib. 7, cap. 12, as if it was a
kind of Wild Hyacinth, but in the place cited,
Theophrastus gives us neither its Form nor Quali-
ties, but barely the Name; but I fuppofe they
might referre it to a Species of some of
those Plants, because of its Bulbous Root. Or dig-
fift of all, and after him Camerarius, Celsius and
Label, with many others, refer it to the Sar-
tyron Difcorides, which seems to be the very
truth it is, forfe these following Reasons. I. From its
place of Growing; for that it grows frequently and
plentifully in many parts of Greece, and the Leper
Affia, and fo no doubt could not be sufficiently
known both to Theophrastus and Difcorides.
II. From the Form of the Plant. The Sartry
Difcorides commonly bore three Leaves on a Stalk,
not much unlike a Lily (Caps has sometimes
three, rarely four or five,) whereas some are of
times seen to be red in the fifth Springing, and alfo
upon the Decaying, especially in a dry time, and a
dry Ground. III. From the Form of the Root. Dif-
corides's Sartry has a round Root, and as white
in the as an white of an Egg, as the Tulip has, core-
ed with a brown Coar, having a fweetfife, but not
ampleilant Tulfe. IV. From the form of its Flower.
Those which have red Flowers, may very well
agree with that Species called Lythrum, which
fie in Marthulon upon Difcorides, page 637, and
fays his Comment on Theophrastus, lib. 7, page 371, which Camerarius in his Epitome. Label
and others, call Lilie Nocinflus, because it has fome
resemblance of the Lily in the Leat, flower and
Seed, and the Narcifius or Daffodil in its Root.
V. From the Qualities. For that fome very learned
Phificians have affifted to me, and that from Expe-
rience (as they fay,) that the Tulip Roots have
the fame Virtues which Difcorides's Sartry, and
Theophrat's Herba quam lntales attutvreas ha,
and that not inferior to the fame. The greatesf
difference with Difcorides, is in the Seed, which
yet I think, (considering the usual way of speak-
ing) is none at all; for as he fays, it is fomething
like to Linseed, fo we often fay of many other things,
which are far from being exactly like the fame.
The Seed of the Tulip is not good for food, nor
thing, and agrees well enough (generally speaking,) to Flax or Linseed, alfo of another Color,
and larger as Difcorides felf fays: But if there
should be a mixture in the Writing of: Linke, Lin-
ke, Flax, for Rote vel Main, Lillf, Lilly, (as was early
in Counter Manuscript, before the Mystery of
Printing was invented;) the flip of the Pen being
both early and likely,) then it is out of all doubt,
Salmon’s Herbal. Lib. I.

that these two Plants, or Plant going by two Names, viz. Satyrion and Tulipa, are absolutely one and the same. VI. Lastly, if this Our Tulip, be not the true Satyrion of Dioscorides, we know nothing this Day in the World that can afford to it, which has but one single Bulb as this has, the Teltarich being in truth, nothing of kin to it. There are, (as Authors will have it) three remarkable Kinds of the Tulip, (which yet have only respect to the time of their Flowering,) viz. 1. The Praxess, or Precionce, which the Turks call Cifta Lata. 2. The Media, or Media, the middle Flowering Tulips. 3. The Serotina, or Serotina, the late Flowering Tulips, which the Turks call Cvs Lata. All these Dalechampius calls by the name of Ouleda, and we only Tulips. Of these three Sections of Tulips, there are many Varieties, of all which, one General Description will be enough to give you the full of all those various Flowers, after which, we will give you the Principal of all those Varieties. As they were more Antiently taken notice of, and the Names they were then known by, from Mr. Parkinson. 2. As they are now specified, and the modern Names they are called by, from Mr. Rea. These Varieties chiefly arise from their diversities of Colours, produced by their own Sowing of their Seed, Planting and Re-planting them, which various Colourings seem to be admissible in them, beyond what can be found in any other Flower in the World hitherto; every Year yielding a new mixture and variety, which probably was never seen or observed before. The Media, which Flower between the early and late Flowering, some will not have to be a Species by itself, because they nearer parallel with the Serotina than with the Precios, as well in the color of its Leaf, being of the same Greenness, as in the bigness and height of its Stalk and Flower, being as high and large as the Serotina, as also because the Seed of a Media Tulip, never brings forth a Precionce, but many times a Serotina: as again, a Serotina Seed many times brings forth a Media Tulip, never a Precionce. But because the Media Tulip is taken as a Species by most Authors, we shall not here break the Order, but treat of them as they are generally received.

The General Descriptions.

III. Its Root being well grown is round, and somewhat great, small and pointed at the top, and broader, yet rounder at the bottom, with a certain eminence, or bunching out on one side, as the Root of the Colchicum has, but not so long, or great; it has also an hollowness in the side, (if it has been a Flower,) where the Stalk grew: For the in the time of its first Springing up, until it flows its Buds for Flowers, the Stalk which with the Leaves thereon, rises up out of the middle of the Root, yet when the Stalk is risen up, and flows the Bud for Flowers, it projects to one side, making an imperfection therein. This Root is covered over with a brownish thin Coat or Skin like an Onion, having a little noodliness at the bottom, but where and firm within, yet composed of many Coats, one cloathing in, or enfolding within another, like as the Root of a Daffodil, or Narcissus, of a reasonable good Taste, not very fierce, but nor in the leaf unpleasant. From this Root comes a little Sprout out of the Ground, with its Leaves folded one within another. The leaf, or broad Leaf rises up first, sharp pointed, and folded up round together, until it be an inch or two above the Ground, which then opens it self, flowing another Leaf folded also in the Bofom or Belly of the first, which in time likewise opening it self, thirfs forth a third, and sometimes a fourth and fifth. The lower Leaves are larger than the upper, are fair, thick, broad, long, and hollow like a Gatter, and sometimes crampled on the edges, which will hold Water falling thereon a long time, they are of a Willow, or pale whith green color, (but the Media and Serotina, more green) covered over as it were with a Metalfine, or brownet, with an Eye or shr of redness towards the bottom of the Leaves, and the edges being more notably white, (which are two principal Notes in a Precionce, and distinguish it from a Media or Serotina.) The Stalk with the flowers, rises up in the middle, as it were thro these Leaves, which in time stand one above another, encompassing it at certain unequal distances, which is often observed to bend it self crookedly, so as to look towards the Ground, as if it would thrust its Head thereinto, but turning up its Head again, whcih then comes to be the Flower, stands afterwards upright. This Stalk is in the Precionce sometimes but 9 or 10 inches high, sometimes half a foot, and sometimes a foot high; but in the Media and Serotina, much higher, carrying for the most part, but one Flower on the top thereof, not much unlike a Lilly, confisting of six Leaves, green at the first, and after wards changing into divers and sundry colors, making manifold Varieties. The bottoms of the Leaves of the Precionce, sometimes, but most especially of the Media, being as variable as the Flower, which are in some yellow or green, or black; in others white, blue, purple, or tawney, and sometimes one color circling another. Some of these Flowers have little or no Smell at all, some smell better than others, and some smell Sweet. After it has been blown three or four Days or more, it will in the heat of the Sun forced it self open, and lay it self almost flat to the Stalk. In the midst of the flower grows a long green Head or Paintle, (which will be the Seed Vessel,) compassed about with six Chaffs, which are very much, in being sometimes of one color, and sometimes of another, with Pendents diversely varied likewise. This Head in the
the middle of the flower, grows (after the flower is fallen) to be long, round and edged, as it were with three Angles or Sides, the edges meeting at the top where it is smallish, and making as it were a Circle. (This is the end of any Liliy) which when it is ripe, divides its self on the inside, into six rows of six, thin, brownish, greasy Seed, very like unto the Seed of Lilies, but brighter, fitter and more transparent. Something more is to be said of the Tulip, which take in the following Observations.

IV. Obf. 1. All sorts of Tulips usually bear but one Stalk, and that without any Branches; but sometimes Nature is so free in producing, that it has two or three Stalks, and sometimes two or more Branches out one Stalk, each Stalk or Branch bearing one Flower at the top, but this is very rarely seen, and when it does happen once, it hardly ever been again from the same Root; but is a great Sign, this such a Root being now old, will in the Time divide it self into several Roots, each of which, being of a reasonable greatness, will bear both its Stalk and Flower the next Year, and grow with the Mother Plant in color, as all the Off-roots of Tulips do for the most part: For although the young Off-roots of some do vary from the main Root, even whilst it grows with them, not being ripened, it will be of the same color with the Mother Plant.

V. Obf. 2. These grow oftentimes in the Medals, and sometimes also in the Precoces, tho' but few, a Tulip or Root, hard above Ground, at the bottom of the Stalk, and between it and the lower Leaf, which when the Stalk is dry, and is ripe, being put into the Ground, will bring forth in time, a Flower like unto the Mother Plant, of which it came.

VI. Obf. 3. The Flowers all of Tulips confift commonly of fix Leaves; but sometimes they are four to have 8 or 10, or more Leaves, but usually those Roots bear but their ordinary number of fix Leaves the next Year. The Head for Seed, is then for the most part four square or cornered, which at all other times is but three cornered; or when the Flower wants a Leaf or two, as sometimes it does, it is then flat, having but two corners or edges.

VII. Obf. 4. The form of the Flower is also very variable, for the Leaves of some Tulips are all sharp pointed, or all blunt and round pointed; and some, the three outermost, sharp pointed, and the other three blunt, pointed, and some contrariwise. Again, some have all the Leaves of the Flowers, long and narrow; and some again have them broader and shorter. Some Precoces have their Flowers very large and great, equal to those of the Medice or Serotinus, which most commonly are the largest, and others have them as small as the Botanic Tulip.

VIII. Obf. 5. The bottoms of the Leaves of the Flowers are also very diversely divided, and so are both the Chives and Pendents which hang bole on their tops within. And by the difference of the bottoms of Chives, many Flowers are distinguished, which otherwise are very like in color, and alike also marked.

IX. Obf. 6. Of the Smell also there is some diversity, for that the Flowers of some have no Smell at all, some a small Scent, not offensive; some a little sweetish, and some very sweet: And it is hard to say which are not to be distinguished by Writing, but by ones own finelling to them. The Seeds of fweet finelling Plants, many times do not follow their Mother-Plants, no more in their small, than they do in their color.
Salmon's Herbal. Lib. 1.

Salmon, in his "General Herbarium," mentions the Tulip, describing its color, size, and shape. He notes that the Tulip is a plant with a white bulb and long, narrow leaves. The flower is described as having a white, pink, or red color, with petals that are often striped or spotted. The stem is generally green, and the flower is often accompanied by a single leaf at the base. The Tulip is a popular flower, often used in gardens and floral arrangements. Salmon also discusses the cultivation of Tulips, including the care needed to ensure healthy growth and the best conditions for bloom. Overall, Salmon's description of the Tulip is detailed and informative, providing a wealth of information for anyone interested in this beautiful flower.
better sorts, which tho' they may be of the fame or like colors, yet notably differing in their Marking, being either striped, feathered, or variably marked, with two or more colors in each Flower; and this shall (God willing) perform, thro' all their Seasons of flowering. I. From Pae-rius, that you may know their more Ancient Application and Varieties. II. From Mr. Kea, that you may know their present Applications, and the Varieties which are now most esteemed with our Florists; and are as follows.

**Tulipa Praecox alba:**
White Early Tulips.

**Tulipa Praecox Purpurea;**
Purple Early Tulips.

XXX. 16. *Tulipa purpurea fatare rubriflora.* Violets. A deep redith Tulip, or more Violet colored.

XXXII. 18. *Perfici coloris Saturni.* A deep Peach bloom color.

XXXIII. 19. *Perfici coloris pallidioris.* A more pale Peach bloom color.

XXXVI. 22. *Chromatia perfomans.* A Crimson very bright.

XXXVIII. 24. *Principes, purpureaefaturatior,* vel dilatation, oris albis magnis vel purpuris, fundo lato, vel albo, quae multum variatur, & co- lore & oris, ita ut purpurae eff elegantoris oris abhis, dilit eff Principes excellentius. Prince, or most excellent Prince; having a deep or pale Purple with white edges, greater or smaller, and a yellow bottom, or circled with white, varying much both in the Purple and Edges; so that it is a fair deep Purple, with great white edges.

XXXIX. 25. *Principes Columbiana, purpurea dilatior.* The Dove colored Prince, paler purpled, with white edges.

XL. 26. *Paeonia Chromas, rubicandiori- coloris, albidis,* vel oris abhis.* The Purple Chromatia colored Prince of a rubicund color, with white, or whithifh edges.

XLI. 27. *Paeonia, vel Obflecta albidis oris Principis Bramio.* The Obflect Bramio Prince, purpule with white edges.

XLIII. 29. *Paeonia in extemioribus, carnes- corvus ad medium intus, oris abhis, fundo lato.* Purple without, and Bluff half way within, with white edges and a yellow bottom.

XLIV. 30. *Paeonia albus purpureus extra, oris albis, intus purpuratior, fundo lato, vel orbus.* Purple with a white on the outside, with white edges, and paler Purple within, the bottom a little yellow, or circled with white.

XLV. 31. *Paeonia alba, minus elegantibus planata, minorabatis, oris arbis.* Another Purple feather'd, but not so elegantly or fairly plum'd, being more obscure, with leopard white edges.

**Tulipa Praecox Rubra;**
The Early Red Tulip.

XLVI. 32. *Rubra vulgaris fundo lato, & al- jguardis Nigra.* The common or ordinary red Tulip; with a yellow bottom, and sometimes with a black.

XLVII. 33. *Rubra fatare oris luteis purpuris, delle Roan.* The Roan, being a deep red, with a small yellow edge.

XLVIII. 34. *Baro, rubra magis interfaco, oris luteis purpuris.* The Baron, which is a fair Red, with a small edge of yellow.

7M XLIX. 35.
Tulipa Praecox Lutea: The Early Yellow Tulip

LXV. 1. Admiral Crinna. It is in all respects like the Core Heart, but more constantly well marked with white.

LXVI. 2. Admiral Ensign. It has a weak Salk and small Flower, with sharp pointed Leaves, rip with Crimson, and feather'd with white; the bottom white, with pale yellow Nails and Chives.

LXVII. 3. Aurora, or Grenfig. This is another good Flower, of much Camarion color, well striped and marked with white; the bottom and Chives of a pale yellow.

LXVIII. 4. Aurora von Burt. It is a well formed early Flower, varably marked with red and white, and much effeminated, the bottom and Chives of a pale yellow.

LXIX. 5. Alston. It is one of the last of the early Tulips, and well effeminated, the Leaves are narrow, of a very good purlple color, well striped with Snow white, the bottom and Chives of a pale Yellow.

LXXI. 6. Bonventura. It is a very good early Tulip.

LXXII. 7. Brandenburgh. It is a middle sized Flower, the tops of the Leaves of a Pale Bloom color, and the edges from the middle to the bottom, white with yellow Chives.

LXXIII. 8. Brown Marsce. It is a pretty pleasing early Tulip, and by some much effeminated.

LXXIV. 9. Core Heart. It is a small low Flower, Camarion strippd, and marked with white, but seldom enough white, the bottom and Chives or a pale yellow, as in most of the early Tulips.

LXXV. 11. Clermont. In the manner of its growing, it is like the Religious, the Salk strong, and the Flower large; sometimes prettily marked with deep Carmion and white, the bottom and Chives both yellow.

LXXVI. 12. Clermont Fargone. In the manner of its growing, it is like the last, but much a better Flower, more constantly marked with white, upon a bright blowwd Camarion; this is another effeminated than the former, by all that have both Kinds; for tho' the first be in many Hands, this is not truly so, for it is a Trick much used by those that Sell Flowers about London, to add Pe. ragon to the Name of any common Flower, when it comes well marked, and then imposes a treble Price.

LXXX. 13. Cimena. It is a pretty pleasing early Tulip.

LXXXI. 14. Dols de Champl. Another good early Tulip, well marked.

LXXXII. 15. Dorade. It is an early Tulip, and by some much effeminated.

LXXXIII. 16. Dutchefi Brandnon. It is a fair large Flower, with long, round pointed Leaves, of a deep burning Scarlet color, with deep Butter colored edges, the bottom large, round, and pale yellow, with chive's of the same color.

LXXXIV. 17. Everfandef. It is both Purple and white, a very pleasing early Flower.

LXXXV. 18. Early Perfeft. It grows something taller than the Aurora, or Grenfig, the Flower fine Carnation and white.
Chap. 713. English Herbs.

LXXXIII. 19. *Fair Anne*. It is an upright Flower, in shape like the Cerinon, with round pointed Leaves, marked with green Flakes of white, and Claret-Wine color; the bottom white, with pale yellow Chives.

LXXXIV. 20. *Fiorante*. It is a low Flower, most of a pale Horfe-Flith color, finely variegated and marked, with some Crimson, and at first pale yellow, which after runs white. It is a little apt to run, that is, in one or two hot Days to fluster its Colors, and run one into the other, which takes away the Beauty of the Flower. The bottom and Chives are both blow.

LXXXV. 21. *General Briancion*. It is a strong upright Flower, of a bright Scarlet color, with even and well parted Butter colored edges, which, before the Leaves fall, run white; the bottom is of the color of the edges, and the Chives purple.

LXXXVI. 22. *General Duke*. It Flowers later than the Winter Duke, and is a firmer and better Flower, of a bright red, or Cherry color, with large and well divided yellow edges; the bottom and Chives like those of the Winter Duke. There are several sorts of Dukes, some deeper, others paler, but all with yellow edges, of which this and the Winter Duke are esteemed the best.

LXXXVII. 23. *General Molfwick*. It is of the same Family with the Admiral Crith, or Corn Heart, and of the same colors, but much better marked than either of them.

LXXXVIII. 24. *Galatea*. It is a fine Flower, of a bright Catequina color, with white; the bottom and Chives of a pale yellow.

LXXXIX. 25. *Golden Bloom Brentule*, and *Golden Bloom Scarlett*. They may for Varlety be mentioned, being both large Flowers of pale red colors, and some large Stripes of a Gold color thro' the Leaves; the bottoms and Chives of both are yellow.

LXXXIX. 26. *Lea Virgin*. It is an early Flower, and accounted amongst the best edges; of a fine blowith red color, with large and well parted pure white edges; the bottom and Chives of a pale yellow.

LXXXIX. 27. *Morning Glory*. It is a pretty flowering Flower, of a pale Gredine color, well fringed and marked with white, the bottom and Chives of a pale yellow.

LXXXIX. 28. *Marqués*. It is a Flower of small Beauty, respected only for the fragrantes of its colors, which in this are fad Horfe-Flith, dark yellow, and some fmall Veins of red, conflantly placed, the middle of the former red, and the yellow.

LXXXIX. 29. *Amarilim Crimfone*. It is an excellent Flower, much more esteemed than many others, of a fine bright Crimson, and pure White; finely fringed, spotted, and well parted, the bottom and Chives of a pale yellow.

LXXXIX. 30. *The Noble*. It has Flowers much better marked with Crimson and White, in bearing off Sess and young Roots, than in the old, whose Flowers (the larger) are little marked with white, scarce appearing to be the Parents of such Beautiful Children; the bottom and Chives are both of a pale yellow.

LXXXIX. 31. *Nothuch Petit*. It is of the Size and Fafion of the Bradfordon. The Flower is of a pale blith amifite white, pretty marked with many small Stripes, and Specks of Orange-Yammy, the bottom and Chives of a pale yellow.

LXXXIX. 32. *The Omne*. It is the loft Flower of any of the Precious; has a strong upright Stalk, a fair flower, and well formed, of a pale Rose color, with many Veins and marks of Crimson, circling and guarding, and great Stripes of white. The bottom and Chives are both blow, which is seldom found in a Precious.

LXXXIX. 33. *Paragon Brentule*. It is a pretty pleasing early Tulip.

LXXXIX. 34. *Paragon Grahberi*. It is a fine early Flower, very well fringed upon Carmination with white, the bottom and Chives are of a pale yellow.

LXXXIX. 35. *Paragon Leyden*. It ought to be the first of the feathered and variegated Kinds, in respect of Antiquity and Colors, which are red and yellow. In the younger Roots well placed, feathered and fringed; but commonly the Flowers of the older Roots are more yellow than red, and often all yellow, as the bottoms and Chives are.

LXXXIX. 36. *Peribon*. It is a strong Flower, of a fair shining blowith red color; sometimes well marked, with greater and lesser Stripes of white throughout every Leaf: But if the red has the Maffrey, it will quickly run all over the Flower. The bottom is white, and the Chives are yellow.

LXXXIX. 37. *Pretty Betty*. It is a good Edges; the Flower is of a bright Crimson, with pale Butter colored edges, which soon turn white. It has a Star-pointed bottom, of the color of the edges, and blow Chives.

LXXXIX. 38. *Princef*. It is something like the Peribon, but of a more blowith red color; sometimes well fringed and feathered with White. The bottom and Chives are of a pale yellow.

LXXXIX. 39. *Religion*. It is a strong healthy Flower, of a dark red color, with many small Stripes of white, but commonly the red has the Maffrey; and if the Seafon be hot, will soon run over the white. The bottom is of a pale yellow, and the Chives of a dusky brown.

LXXXIX. 40. *Bretocchi*. It is an early Tulip, but of no extraordinary account.

LXXXIX. 41. *Superintendent*. It is a Flower of good account, rises higher than ordinarily others do, the Flower is fair and large, exceedingly marked with Violet, Purple and good White: the bottom and Chives being of a pale yellow.

LXXXIX. 42. *Lugana*. It is a good, but common early Tulip.

LXXXIX. 43. *Venician*. It is another early Tulip, but more clemency than the former.

LXXXIX. 44. *Vice-Roy*. It is an Old Flower, of a Violet Purple color, edged, feathered, and fringed with white; the bottom and Chives of a greenish-yellow. They often add Paragon to the Name of this Flower, as if it were a distinct Kind, when it is but the same better marked than usual.

LXXXIX. 45. *Violet Rigante*. It is a reasonable tall Flower, with a woolly Stalk, and tharp point- ed Leaves, of a Violet Purple color, with large Snow white edges. The bottom and Chives both yellow.

LXXXIX. 46. *Violet de Remon*. It grows taller than the last, with a timous Stalk, and a fair large Flower, of a rich Violet Purple color, with large and well divided Snow white edges, a white bot tom, and black Chives.

LXXXIX. 47. *Unique de Delf*. It is a pretty pleasing early Tulip.

LXXXIX. 49. *Winter-Duke*. It is so called, in respect that it Flowers commonly in Winter, that is in February, or before the Tenth of March; at which time the Spring begins. It has a very low Stalk, and bears a short Leaved Flower, of a deep red color, with large yellow edges, a round yellow bottom, and brown Chives.

7 M 2 II. Tulipe
II. TULIPÆ MÉDÆ, Middle Flowering Tulips.

First from Mr. PARKINSON.

CXIV. Tulipa Media, the Middle Flowering Tulip. These begin to Flower about a Month after the Early Tulips; yet some longer after, and some sooner: And in the variety of the colors of the Media, such Mixtures and Varieties are to be observed, which can never be seen in the Precocious, as there are in the Precocious, which are not in the Media. But the Varieties in the Media are far greater, which chiefly happens from the Sowing of the Seed, for which Reason, it is very difficult for any one to come to the Knowledge of all their Diversities; but the most remarkable are these following.

Tulipa Medæ alba: The mean flowering White Tulips.

CXV. 1. Nivea, fando albo vel latino. The Snow white Tulip, with a white or yellow bottom.

CXVI. 2. Argentea, gaudi alba cineracea fundo luteo, purpureis laminisibus. Silver colored, which is a very pale or whith Alba colors, with a yellowish bottom, and purple Leaves.

CXVII. 3. Margaritina alba, carnos dilatissima. Pearl colored, with a diluted blue.

CXVIII. 4. Alba, fundo caroli vel nigra. A white with a blue or black bottom.

CXIX. 5. Albida. Cream colored, or light Straw colored.

CXX. 6. Alba Young, A white with Red edges.

CXXII. 8. Alba Purpurea Coccinæ. A white with Crimson edges. Thfe three last sorts do hold their Edges confant in Fomte, but well spread in others.

CXXIII. 9. Alba primus, deinde adibis, oris Purpureis, & variis interficiuntur vel bis ditis Hackneyly. A pale or whithy yellow, which after a few Days grows more white, with Purplish red edges, and some Streaks running inwards from the edges, which we call an Hackney Tulip.

CXXIV. 10. Alba, colore Sanguineo variata, fundo albo vel albo. White, mixed with a Blood-red color very variably, the bottom either of a pure white, or some other color.

CXXV. 11. Alba, radium diplophæ Blumae, & Alba Coccinæ. A White Lancome with Crimson Flames and Spots, throughout the whole Flower.

CXXVI. 12. Alba, Purpurea rubens planeta, diversifera specierna, qua cum superioris, vel alba, vel lutea, vel purpurea caroli contenta fundo, &c. A White plumed or speckled with a reddish Purple, more or less, of divers sorts, with white, yellow, or blew bottoms; all which do hold their Marks constant, and do not spread their colors, but flow later after they have flowered three or four Days.

CXXVII. 13. Panni Argentæ coloris, quam alba planeta, planula, striata, vel diversifom.
edges, greater or smaller, like the Early Prince, the bottom either blew, circlet with white; or White circled with a large blew.

CXLII. 28. Hol冼 et Herba, Sanguinaria guttis in ala medio furrum in orbe, fundo caro-

ceo, A Purple Holias, of a pale Claret-color, marked and spotted with Blood-red Spots, round about the middle of each Leaf, upwards on the inside only, the bottom being blew.

CXLIII. 29. Tanica Morionis purpurea rubra

sutura, abido striata, quam in alia suturatio-

funde ex ceruleo & albo. A Foilos Coat, dark

Crimson and pale White, emulated together di-

ferring from the white Fools Coat, the bottom blew and white.

CXLIV. 30. Purpurea rubra sutora vel disu-

la, albo, vel albedine, punctata vel lineata diversi-

modi, Curlyphyllata delta. A Purple colored deeper
er or paler, spotted or striped with a part or pal-
er white, of divers forms, called the Giliflower-

Tulip.

Tulipae Mediae Rubrae: Mean Flowering Red Tulips.

CXLV. 31. Rubra communis, fundo lato vel

nigro. The common fair red colored, with a yel-

low or black bottom.

CXLVI. 32. Mali Aurantiæ coloris, A Tulip of

a deep Orange color.

CXLVII. 33. Cannabiris coloris. A Canabari

or Vermillion colored Tulip.

CXLVIII. 34. Lateriæ coloris. A Tulip of a
dale dull red, or of a Brick color.

CXLIX. 35. Rubra lutea offera. A Greet-

dine, or red sprinkled and mixed with yellow.

CL. 36. Telfamentum Brancion, rubra satura,

oris palladis, diversum furrum, rubre vari-

antium, & orum amplitudo. Branchi Tem-

fament of divers sorts, differing both in the deep-

ness of the red, and largeness of the pale colored

edges.

CL. 37. Rubra oris lutea. A red Tulip with

small yellow edges.

CL. 38. Cannabiris radiata, magis ominus

Seroton. A Vermillion irradiated or flamed, later

or earlier Flowering.

CL. 39. Rubra purpurascens oflota, folis

exteriusibus, perfusa luteo intus, oris pallidii

luteis. A dead Purpulish red without, or on the

outward Leaves, and of a yellowish red within,

with pale yellow edges.

CL. 40. Rubra purpurascens elegantius extra,

& intus benefaria, oris pallidius luteis, fundo lato

tel viridi. A bright Crimson red on the outside,

more yellowish on the inside, with pale yellow

edges, and a yellow or green bottom.

CL. 41. Rubra flambeae cocteis, crebris

maculis, oblique fundo. A red Flambeant, spotted

thick with yellow Spots, without any bottom.

CL. 42. Rubra flambeae elegantia, qua ra-

dice lutea, intercurfianis rubreem. A more ex-

cellent red Flambeant, with Flames of yellow run-

ning through the red.

CL. 43. Flambeae remissor, utrque color.

A more pale colored Flambeant in each color.

CL. 44. Panni Aurei coloris. A Cloth of

Gold colored.

CLX. 45. Tanica Morionis vertex, sex P a-

tis foliis, optima teneris amnis amnis & crebris, ex

rubro & flave separatis dritus & occurrentibus,

Flos colet. A true Fools Coat, the beat of which

is a fair red, and a fairyellow, parted into Guards,

every one a part; varied through every Leaf to

the very edge, yet in most abiding constant.

CLX. 46. Tanica Morionis altera, teneri mi-

noribus & minus frequentibus, magis ominus minus

dalis inconstans. Another Fools Coat, not so fin-

tely marked, nor so much, some of which are more

or less constant in their Marks, and more variable

than others.

CLXI. 47. Tanica Morionis pallida, qui te-

nimi vel flave frequentibus in utrque color 

pallidi, Flores eft confans & eleganti. A pale Fools

Coat, which has many Guards or Stripes with red

and yellow, which are both pale, and is a con-

stant and fair Flower.

CLXII. 48. Pileus Morionis, radix lutea, in

medio foliis luteis, per ruborem inssubsetibus,

fundo luteo, alpecibus latisi, orisrubris, vel albo-

oris. Fools Cap with yellow Stripes, which are

broad in the middle of the Leaves, the red run-

ning quite through the Leaf, with a yellow bot-

tom and yellow Chives, the three outward Leaves

being yellow, with red edges or without.

CLXIII. 49. Le Saffo, tenera radiata magni,

extrarore & Zollu. A Swirls Pulted with a fair

red, and pale white, or Straw color.

CLXIV. 50. Saffo Galiob, dita a Jloris mog-

nidin. tenera radiata, filmena Le Saffo, nigri

rubri & alboe fum elegantior. The Swiss Gal-

liah, so called from the bigness of the Flower,

most like to the former Saffo, in the flowering or

radiated Guards, but that the red and white is

more lively.

CLXV. 51. Holias rubra, que Sanguiniae Ar-

genis radius & gutiris in orbem diffusus, præftri-

tion interna, fundo viridi futor. A red Holias,

which is a Blood-red, striped with Silver white

Vains and Spots, with a dark green bottom.

CLXVI. 52. Holias Cocineæ, rubra Cocineæ,

alia radiata in orbem. Circa medium foliis inter-

sibus, fundo alto. A criform Holias, which is a fair

Purpleish red, spotted with white circle-like word

the middle of the inner Leaves, with a white bot-

tom.

CLXVII. 53. Alia buis femita, fundo albo &

Ceruleo. Another like thereunto, with a blew and

white bottom.

Tulipa Media Luteae: Mean Flowering Yellow Tulips.

CLXVIII. 54. Luteæ, qui Aurea vulgaria.

The common yellow, or Gold colored Tulip.

CLXIX. 55. Straminæ. The Straw-like, or

Cream colored.

CLXX. 56. Sulphurea. Sulphur colored, or

Pall yellow with green.

CLXXI. 57. Mali Aurantiæ pallidi coloris.

Pale Orange colored.

CLXXII. 58. Luteæ dilute Purpurae Sristae,

Aurei Fanni pallidius infinus. A yellow, palely pur-

ple streaked, or pale Cloth of Gold color.

CLXXIII. 59. Luteæ Pallide Eucoderæ Adamu

bræ. A Cream or Curlaid colored pale yellow,

shadowed over with a brown.

CLXXIV. 60. Eucoderæ rubris magnis, aur

partiis. A gold yellow with red edges, greater or

less Tulip.

CLXXV. 61. Straminæ oris rubris magnis in-

tenti, vel parvis remissis. A Straw color, with

deeper or paler red edges, great or small.

CLXXVI. 62. Olfaera & Folligina luteæ, in-

fini

It is a pretty Flower, of a dark reddish color, var-

iedly marked with fad Ifabella and Straw color, the bottom and chives a dark Purple.

It is a large Leaf'd old Flower, of a fuller reddish color, some Flakes and Marks of an over-worn Dove color, with a whithl bottom and black chives.

A pleasant good Flowers, of a Purple color, mixed with white. A little Orange, light Flieth color, and pale yellow, with a green-

bottom and black chives.

A large Flower, well marked with a pale Rose color, some crim-

son and white; the bottom and chives blew.

It is like the Agen Robie, but much better, of the time fad red color; often well marked with Dove color, crimson and white; the bottom white, and chives black.

It is like the Agen Robie, or Bebonet, a little Orange, light Flieth color, and pale yellow, with a green-

bottom and black chives.

It is a fine Flower, often well marked with Dove color, deep red, inclining to murrty and white; the bottom and chives blew.

It is a fine Flower, of a heavy fad Ifabella color, with some Marks of Rich crimson, and great Stripes of yellow, a dark bottom, with large black chives.

It is a low Flower, with long, narrow, tharp pointed Leaves, of a color between Horle-Flelh and Ifabella, a little striped with white, blev bottom, and large Purp-

le chives.

It is a beautiful Flower, striped, agated, and variously marked with Rose color, deep crimson, and fne white; the bottom and chives Purple.

It is a good Flower, finely marked with Rose color, Greensline, deep crimson and white, the bottom and chives Purple.

It is an old Flower, with narrow tharp pointed Leaves, of a pale Greensline, and Mory purple, sometimes agated, Vened and marked with white, the bottom and chives blew.

It is a beautiful Flower of three good colors, pale Greensline, deep, and pure White, commonly well parled, stri-

ped, agated, and exceedingly well placed, abiding conftant to the fift, with the bottom and chives blew.

Salmon's Herbal. Lib. I.

Tulipa Medie Virides: Mean Flowering Green Tulips.

CLXXXVII. 73. Tertio ad but dilatari viri-

date oris purpureis. The third of a more yellow-

th green, with red or purplish edges.

CLXXXVIII. 74. Quarta cujas folia aequali-

ter Purpures dilata, & Viride diversa sunt. A fourth, with both the Leaves of the Flower equat-
lily almoft parted, with green and a light Purple-

color, which abiding a long time in Flower, grows in time to be much fairer marked; fome call it a Green Saffo.

CLXXXIX. 75. Quarte folis longinis Stem-

em expanfit, ex rubere & Viride coele. A Fifth, which has the longest Leaves, flanding like a Star, conftilling of a mixed Green and Pur-

cle color.

Tulipa Media:

Mean Flowering Tulips,

ACCORDING TO

Mr. JOHN REA

CXC. 1. Agen Marine. When it comes well, it is a pretty Flower, of a dark reddish color, va-

riedly marked with faid Ifabella and Straw color, the bottom and chives a dark Purple.

CXCII. 2. Agen Rubine. It is a long Leafl'd old Flower, of a fuller reddish color, some Flakes and Marks of an over-worn Dove color, with a whithl bottom and black chives.

CXCIII. 3. Agen de Gerrier. A pleasant good Flowers, of a Purple color, mixed with white. A little Orange, light Flieth color, and pale yellow, with a green-

bottom and black chives.

CXCIV. 4. Agen Bizar. It is a deep Orange, light Flieth color, and pale yellow, with a green-

bottom and black chives.

CXCV. 5. Agen Pic. It is a large Flower, well marked with a pale Rose color, some crim-

son and white; the bottom and chives blew.

CXCVI. 6. Agen Robine Paragon, or Robiner. It is like the Agen Robine, but much better, of the time fad red color; often well marked with Dove color, crimson and white; the bottom white, and chives black.

CXCVII. 7. Agen White. It is like the lift, but a jeffer Flower, Dove color, well marked with deep red, inclining to murrty and white; the bot-

tom and chives blew.

CXCVIII. 8. Agen Rampard. It is a fine Flower, of a heavy fad Ifabella color, with some Marks of Rich crimson, and great Stripes of yellow, a dark bottom, with Large black chives.

CXCIX. 9. Agen Grebe. It is a low Flower, with long, narrow, tharp pointed Leaves, of a color between Horle-Flelh and Ifabella, a little striped with white, blev bottom, and large Purp-

le chives.

CC. 10. Agen Royal. It is a beautiful Flower, striped, agated, and variously marked with Rose color, deep crimson, and fne white; the bottom and chives Purple.

CC. 11. Agen Oriental. It is a good Flower, finely marked with Rose color, Greensline, deep crimson and white, the bottom and chives Purple.

CCI. 12. Agen Port Vin, or Paps Citratel. It is an old Flower, with narrow tharp pointed Leaves, of a pale Greensline, and Mory purple, sometimes agated, Vened and marked with white, the bottom and chives blew.

CCII. 13. Agen Hamme. It is a beautiful Flower of three good colors, pale Greensline, deep, and pure White, commonly well parled, stri-

ped, agated, and exceedingly well placed, abiding conftant to the fift, with the bottom and chives blew.
Chap. 713. English Herbs.

blew. This Gallant Tulip has its Name from Sir Thomas Hanmer, who first brought it into England.

CCIII. 14. Angel Denison, or Argen. It is of the same color with the Leaf, and like it in the manner of marking. The chief difference is, that the edges of the Petals pointed, and not so broad as the Leaf; the Gredeline a little redder, and the Scarlet paler; the bottom and chives blew, but much inferior to the former.

CCIV. 15. Admiral Vander Poole. It is of a dark red, inclining to Liver color, feathered and marked with pale yellow, which one hot Day turns white, the bottom and chives white. This is a pleasing Flower, but not a little at all.

CCV. 16. Admiral Caroline. It is an old Flower, of a bright carnation, some crimson, and consistently well marked with white.

CCVI. 17. Admiral of France. It is like the Paragon Brandon, in color and manner of marking; but the Leaves of this, and do not Iand round as those of other Flowers. The bottom and chives purple.

CCVII. 18. Admiral Heart. It is a fine Flower, of a good carnation color, deep crimson, and drooping, the bottom blown, and chives marked.

CCVIII. 19. Admiral de Home. It is an old Flower, of a deep red, striped with white, but furred, and not well pressed; besides it is apt to run, the bottom and chives yellow.

CCX. 20. Adonis. It is sometimes a pretty Flower, of a deep bluish red color, marked with some light crimson and white, but when the Red has the Maffey, it will quickly run over the other colors, and the bottom and chives are a dark blow.

CCX. 21. Ariane. It was raised from the Seed of the Targantia, from which it differs, in that the Leaves are thicker, a purer white from the first opening, and very well marked with bigger and fuller broken Stripes, and Drops of bright crimson: The chives are Purple.

CCXI. 22. Anvers Brown. It is a fair well formed Flower, of a fa red brown color, striped and marked with some brighter Purple, and more or less white; the bottom blow, with dark purple chives.

CCXII. 23. Amontil Brown. It is like the last, only the colors are brighter, and the Flower commonly better marked.

CCXIII. 24. Althea. It is a very good Flower, composed of purple and white.

CCXIV. 25. Andorra. It is a fine Tulip, pale yellow, well marked with dark crimson color, and the chives purple.

CCXV. 26. Amazon. It is a splendid Flower, with many good colors.

CCXVI. 27. Arch Duke Imperial. It is an excellent Flower, composed of several purples and white.

CCXVII. 28. Arch de Andro. It is almost like the former, but not so noble a Flower.

CCXVIII. 29. Aurora. It is of the color of a bright clear Morning, a pale yellow, with some very small Stripes of Red, and brown chives.

CCXIX. 30. Amphirose. A fine Tulip, composed of purple and white.

CCXX. 31. Auguflina. A delicate Flower composed of a Violet color and white, variously mixed.

CCXXI. 32. Armiente. It is a good Flower, flamed with purple and white.

CCXXII. 33. Bethie Bar. It is an old Flower, shaped like the Blew Tourners, of the same color, but more constantly marked with white.

CCXXIII. 34. Bleu Tournier. It has Flowers in form like Emy, the colors are Gredeline, crimson and white, but very uncoold, and often little or no white.

CCXXIV. 35. Biilly. It is a fine Flower, with variety of colors.

CCXXV. 36. Brown de Morris. It is a dull fat purple, but by some much esteemed.

CCXXVI. 37. Brown Purple Blush. It is a fine Flower, composed of several Purples, but the brown most predominant, and marked with white.

CCXXVII. 38. Bethie Breire. It has a weak Stalk and small Flower, of a good crimson color, well guarded and striped with pale yellow, which one hot Day turns white; the bottom and chives are a pale yellow.

CCXXVIII. 39. Bel Breire. It is a fair Flower, of a dark brown crimson color, well marked, feathered and striped with white. The bottom pale yellow, with large fluffy brown chives.

CCXXIX. 40. Brown George. It is a large round Flower, thick striped, and pandered with a ladder and a brighter Cinnamon color, upon a pale yellow with black chives.

CCXXX. 41. Bign Veni. It is like the Pearl in the lathion of the Flower, but much better: It is of a pale crimson color, striped and variously marked with white; the top of the Leaves are of a pale Flax color, and the bottom and chives yellow.

CCXXXI. 42. Bimaise. It is a small weak Stalked Flower, of a bluish carnation color, a little marked with white, the bottom and chives blow.

CCXXXII. 43. Benedixione. It is a pretty Flower, of a bright carnation color, well marked with white; the bottom and chives are of a dark purple.

CCXXXIII. 44. Bel Palllar de Paris. It is a better Flower than the ordinary Pallar, is commonly well marked, and striped upon a bluish red, with some crimson and more white; the bottom and chives blow.

CCXXXIV. 45. Brown Purple de Morris. It is an excellent fair Flower, of a rich shining Purple-color, and pure white, marked with great Stripes up the middle of the Leaves; the bottom Blow, with Purple chives.

CCXXXV. 46. Brabazon. It is of several forms, and all of them fine Flowers, and of several Purple colors, as Brabazon Adrian, Brabazon Dionysus, Brabazon Pelt, Brabazon Peltius, & Brabazon Peltis, all of them of several Purples and Whites, much differing from each other in colors, and manner of marking. But the Petals is it the most common of them, to it is the smallest, well marked with two Purples and White.

CCXXXVI. 47. Converge. It is a Tulip adorned with several Purples, mixed with White variously.

CCXXXVII. 48. Cleomedon. It is a Tulip arising from a pure color, produced from Seed.

CCXXXVIII. 49. Cythere. It is a fine Flower, of a dark yellow color, finely marked with small Lines of Hair color, and dark crimson, having Purple chives.

CCXXXIX. 50. The Curios. It differs from all others in the form of the Flower; for this has the Leaves thick, and curiously plaited and curled about the edges; the color is dark yellow, finely marked all over with small Lines or red, or Liver color; the bottom and chives are a Violet Purple.

CCXL. 51. Charoamante. It is a fine sort of Tulip, variously marked, not much unlike to the Cleomedon.

CCXLII. 52. Cor-
Salmon's Herbal.

Lib. I.

CCLXXI. *Cardinal Rubellus.* It is of a pale Sca- 

tics color, well marked with white; the Flower 

er is florid and handsom, and its bottom and chives 

are blow.

CCLXXII. *Cardinal.* It is a low Flower, 

of a deep dark red color, sometimes feathered 

with white, and often all red. Some of them 

are rellifed, and come much better marked, the 

bottom and chives blow.

CCLXXIII. *Clelia.* It is a fine Flower, 

variously colored, arising from Seed.

CCLXXIV. *Cardinal Prince.* It is a large 

long Leaf'd Flower, well marked with Floris 

color, crimson and white, the bottom and chives blow

CCLXXV. *Comet.* It is a fair late 

flower, apt to be known by the green Leaves, 

which are large, and full of whithil Spots. It 

has large Leaves, well Velled, striped and marked, 

especially on the infides, with caricass, 

some greenish, and much white; the bottom 

(by the well marking of the Flower,) is com- 

monly white, and the chives blow.

CCLXXVI. *Chinny-Snupper.* It is a low 

flora Leaf'd round Flower, or a blutfih dark 

red color, with a large round whitih bottom, 

and pale yellow chives. Some of them will 

have the leaves Striped, with more or less white, 

and then they are called the Striped Chinny- 

Snupper.

CCLXXVII. *Credo Nauti.* It is of near 

Affinity with the Zeblowm Royal, but much a 

better Flower, of a good blowih carnation co- 

lor, well marked and variegated with crim- 

fon, some greenish and good white. Of this 

there are two or three sorts, but the bell has 

more white, and is not apt to run; the oth- 

ers are: the bottom and chives are blow.

CCLXXVIII. *Cotaggio.* It is something 

like the Dorile, but much a better Flower, of 

the same bright blowih carnation color, varied 

and striped with good white; the bottom and 

chives blow.

CCLXXIX. *Carthus.* It is an excellent 

Flower, elegantly marked and striped with shades 

of Munry, Purple, and pure White, through 

every Leaf thereof; the bottom blow, and the 

chives purple.

CCLXXX. *Caroline Brown Purple.* It is like 

to the Oter in the infilation of the Flower, 

but of a better brown purple color, feather'd, 

and striped up the sides and middle of the 

leaves, with large Lifs of white; the bottom 

and chives purple.

CCLXXXI. *Dentile de Fure.* It is of a pale 

Red color, prettily Leaved, marked and spotted 

twith white; the bottom and chives yellow: 

This is a pleasant Flower, but runs a 

little at first.

CCLXXXII. *Dorile.* It is a hardfom Flower, 

of a blowih bright carnation, varied and stri- 

ped with good white; the bottom blow, and 

the chives purple.

CCLXXXIII. *Diana.* It is of several sorts, 

the bell is called Bella Diana, which is a good 

Flower of a bright blowih carnation, varied, stri- 

ped, and well marked with deep Red and pure 

White, throughout every Leaf, with a blowih 

bottom and purple chives.

CCLXXXIV. *Diana.* A Tulp raised from 

the Seed of the Diana, from which it differs, 

in that the Leaves are edged, and finely whip- 

ped about with a deep brown Purple, and fea- 

ther'd in the middle, with the same color up- 

on Snow white; the chives dark blow.

CCLXXXV. *Doria Diffuse.* It is a kind of 

Diana, the Flower is like the Dorile, but com- 

monly better marked, and striped with small 

lines of Deep Red and Snow white; the bot- 

tom and chives like those of the Diana.

CCLXXXVI. *Doro.* It is of the Family of 

the Widows, and ternneth efformed. Of this 

we have two sorts, the bell is a good deep 

purple, well striped and feathered, thro' every 

Leaf thereof with white. The other is a lef- 

fer Flower, the Leaves narrow and sharp point- 

ed, not so well marked as the former: the 

bottom and chives of both like those of the 

Widows.

CCLXXXVII. *Doro of Holland.* It is an 

excellent Flower of a deep brown purple color, 

finely whips about the edges, and well striped 

and marked with a redder and lighter Purple, 

and pure white; the bottom and chives purple.

Of this there are two sorts, but the bell is 

called the North Dorothy.

CCLXXXVIII. *Durisy.* It is a good Flower, 

of an excellent crimson color, well marked with 

good white, especially on the indefinite of the Leaves, 

the bottom and chives both blow.

CCLXXXIX. *Effod.* It is a pretty Flower, 

compos'd of purple and white.

CCLXX. *Eagle.* It is a fair Flower; Peach 

color, pale greenish, some deep crimson and 

pure white; the bottom and chives purple.

CCLXXI. *Emanuclina.* It is at first a 

fine flower, with long sharp pointed Leaves, 

well striped with Peach color, carnation and white; the bottom and chives a dark purple.

CCLXXII. *Elette.* It is a delicate crim- 

son and white.

CCLXXIII. *Feo.* It is an excellent 

Flower, of a very fine color, from Self-colors, 

raised by Seed.

CCLXXIV. *Flanders Widow.* It is a com- 

on Flower of a fast Purple color, and mark'd 

towards the bottom with a fadder Purple and 

some white: Its bottom, (as also the bottoms 

of all the other Widows,) is small, and of a 
greenish blow color, with Purple chives.

CCLXXV. *Fair Widow.* It differs from the 

Good Widow next following, in that the 

Flower is shorter, more and better marked, and 

marked with two fast Purples and a White.

CCLXXVI. *Good Widow.* It is in all 

things like the Flanders Widow, but more and 

better marked with White.

CCLXXVII. *Graceful Widow.* It is of the 

same fashion and color with the other Widows, 

but commonly marked and striped with more 

White.

CCLXXVIII. *General Essex.* It is of the 

same colors with the Prince of Orange, but 

not so deep an Orange, the yellow paler, and 

more confantly well marked. The bottom and 

chives dark Purple, almost black.

CCLXXIX. *General Gooda.* It is a large 

Flower of a bright crimson color, sometimes 

well marked with White, but commonly the 

Red has the Maltery: The bottom and chives 

are both a pale yellow.

CCLXXX. *General Sueman.* It is a fair 

Flower, bright carnation greenish and white, 

variably placed, and parted at the tops of the 

Leaves, the bottom white and chives blow.

CCLXXXI. *General of Holland.* It is an 

old Flower, of a deep blowish red color, with 

great Marks, and small Stripes of White: The 

bottom and chives blow.

CCLXXXII. *
CCLXXI. General Boletam. It is a fine Flower, of a heavy bright Carnation, palmed about the flower, well fringed and marked with Crimson and pure White, which commonly has the Malle-
ry, the bottom blow, with small black chives.

CCLXXII. General Anwers, or Brown

Doth of Brokehen. It is like the Pem Ansers, but bet-
ter marked with a brown and lighter Purple, and of-

ten well fringed with White; the bottom blow, with

dark Purple chives.

CCLXXIV. General Bole. It is a good

Flower, of near Affinity with the Brown Ansers,

the Flower is agned, fringed, and varily marked,

with a darker and lighter reddish Purple and White,

with a blew bottom and Purple chives. It is a tender

flower, and its root apt to perish in a box or over dunged Soll. There are two or

three forces of it, but the best is that called General

Bole Theon.

CCLXXV. Grand Purpur de Boek, or

Pep Heron. It is an old Flower, with 3 Leaves

that hang up like a Heron top, and three turning
down, of a Sullen, yet flaring Purple color, with

many small lines of Milk-white; the bottom and

chives a pale yellow.

CCLXXVI. General Richard, or Empo-

rer, or Saturn. It is an Old Flower, with a tall

upright stalk, and short Leaves, of a pale Carna-
tion color, baked, and marked with White, a lit-
tle way to run the bottom and chives yellow.

CCLXXVII. Halsfamen. It is a very

good Flower, made up of a mixture of several

Purples and White, the Purples deeper, redder,

blower, and very fine.

CCLXXVIII. Harvey. It is a large va-
rible Flower, but will sometimes be of a dark

Purpuflil Red color, with great Flames of deep flu-

ning Crimson, and small stripes of White; the

bottom and chives of a dark purple.

CCLXXIX. Holoferen, or Goliah. It is a

very tall Flower, marked all over with Shadows

of Rofe color and pale yellow; the bottom and

chives yellow.

CCLXXX. Hercules. It is a Noble fine

Tulp, large, with variety of good colors, well

marked, and very fine.

CCLXXXI. Jachicn. It is a very good

and fine Flower, composed of Carnation, Crimson

and White.

CCLXXXII. Jeronymus Royal, or Paragon

Jerom. It is a good Flower, striped and marked

with Shades of Purple and good White; the bot-

tom and chives of a dark blow.

CCLXXXIII. King Marple. It is like the

Pif Bef Ten, but a flatter and more confiderate

Flower, of a brighter Greadenline, agated and

marked upon white; the bottom blow, with

known daffy chives.

CCLXXXIV. Jacoba rellifyed. It is in

colors like the Admiral de Mar, but much a bet-
ter Flower, commonly marked up the middle of

the Leaves with a great featured stripe of deep

red, the reft white, the bottom and chives are

yellow.

CCLXXXV. Jaffan Tadura. It is a lar-
ger Flower than the Tadura, and of a brighter

Red, some Dove color and much white; the bot-

tom and chives black.

CCLXXXVI. King brown Purrple. It is

a fine Flower, of a browned Purple and White, well

marked and streaked.

CCLXXXVII. Lanfean Bole. It is a fine

Flower, with a fine flower, of a fine flower, of a fine

and striped with grendeline and white, the bottom

chives.

CCLXXXVIII. La Perfue, or Tarde

rellifyed. It is a pretty low Flower, of a pleasant

Carnation, well marked with White; the bottom

and chives of a dark blow.

CCLXXXIX. La Terrera. It is a weak

Stalled Flower, which when it comes well, has

one or two large broken Stripes of a bloveli red

color, through the middle of every Leaf, the

reft white, the bottom blow, and the chives black.

CCXC. Memorable. It has a long

Leaf's Flower, of a pale Tanp Leacher color,

precisely marked with red purple, and bright yel-

low with purple chives.

CCXCI. Memorable. It is a Flower of a

middle fire, the Leaves sharp pointed, of a bright

Crimson color, finely spotted, and marked with

small Stripes, and drops of pale yellow: The

bottom and chives Straw color.

CCXCII. Memorable. It is an old

Flower, of a light Scarlet color, and Milk-

white. Sometimes well marked, but the Leaves

are hollow, and at lift ran : the bottom blow, with

black chives.

CCXCIII. Memorable. It is an ordi-

nary low Flower, pale Scarlet, and marked with

pale yellow, and runs as

CCXCIV. Memorable. It has long, nar-

row, sharp pointed Leaves, of a pale Scarlet col-

or, marked with deeper red, and a white, but

unconfant: the bottom blow, and the chives black.

CCXCV. Memorable. It is an ordi-

nary Flower, of a bloveli red color, marked

form: but like General Richard with white: the

bottom and chives pale yellow.

CCXCVI. Marcel de Queule. It is of a

delible color, with many red Spots standing

together on the infide of the Leaves, like unto a

Spig of Barbieries, and sometimes a little stri-

ped with White: the bottom and chives a dark

blow.

CCXCVII. Memorable. It is a large

strong thriving Flower, molt of a Carnation

color, a little Carnation about the edges, and well

feathered with White: the bottom and chives of a

pale yellow with white.

CCXCVIII. Memorable. It is a valua-

ble Flower, the Leaves are sharp pointed, and a lit-

tle twine, finely marked with bright fuch color, deep

Scarlet and pale yellow: the bottom and chives

black. It usuallly purrs forth a Bath or young

Root, between the bottom of the Stalk and lower

Leaf, by which it is easily known.

CCXCIX. Angelica. It is a fair well

colored and marked Tulp, both spotted and stri-

ped with some White.

CCCI. Oriens, or Otio de Mens. It is a

large, tall, old Flower, often containing eight or

more Leaves, of a dull heavy Purple color, lifted

up on the fides, and sometimes feathered through

the Leaves with White: the bottom and chives

are yellow.

CCCI. Orient Virgin. It is a good

Flower, pale Scarlet and pale white, well divi-

ded in small Marks and Scripces: the bottom and

chives both blow.

CCCI. Paragon Brown Purple. It is a

fine Flower, and well marked and differencfed, with

brown purple and white.

CCCV. Paragon Oudinarad. It is almost

in all things like the Pifes Oudinarad, only the co-

ors are brighter, more condenly well placed,

and in some Years will come to well marked, that

few rich Flowers excel it; the bottom and chives

both blow.
Salmon's Herbal.

Lib. I.

CCCIV. 115. Paragon Francusfe. It is a pretty flower, of a good deep carnation color, well marked with long stripes of white; the bottom and chives blew.

CCCIV. 116. Paragon Blankburn. It has a tall stalk and fair flower, with broad leaves, yet sharply defined, of a light carnation color, with some heads of deeper red. Flamed and striped with white; the bottom and chives both blew. It was raised from the Seed of the Pafs Oustourd.

CCCIV. 117. Paragon de Giflon. It is a good flower, of a fine carnation color, deep crimson and pure white, well placed and broken. The bottom and chives are blew.

CCCIV. 118. Paragon Liffin. It is an ordinary flower, a little marbled and striped about the edges, with an Isabella color, and pale yellow, and sometimes over all the flower, it has a greenish dark bottom, and red blow chives.

CCCIV. 119. Paragon Perigon. It is a good flower, Leaves sharp pointed, variably Veined, striped and marked with Isabella, Peach color, and Milk white: bottom blow, chives dark Violet Purple.

CCCIX. 120. Paragon de Caffe. It is like the Jacob reftiff, but a better flower, well striped and marked with the same deep red color, and good white; the bottom and chives yellow.

CCCIX. 121. Parot. It is of several sorts, some all green, unless a little whitish towards the files of the leaves, others have the Leaves half folded, green in the middle, and the files almost white: but there is one Noble kind before, which is called

CCCXI. 122. Parot-Noble. It grows tall and fine, the green Leaves not in the files, the Flower large, and formed something like the Jaffon, only it has Spirons on the files of the Leaves, which are of a dark brown color, and lighter by degrees to the middle, which is of a whiter green color, very flared in Fashion and colors from all others. The bottoms and chives of all the Parots, are of a pale greenish yellow color.

CCCXI. 123. Pafs Oustourd. It is an Old flower of a red reddish color, sometimes well marked with brighter Red and Straw color. It is common and unconfant: the bottom and chives both blew.

CCCXI. 124. Pafs Bellorne. It differs from the Bellone chiefly in its colors, which in this are finer gredeline, some carmation, and much white, well placed and parted: the bottom and chives both blew.

CCCXI. 125. Pafs Rofe. It is a fine round Flower, variably marked upon a pale Rose color, with crimson, and some Veins of Straw color, resembling a well Water'd Tubby: the bottom and chives pale yellow.

CCCXI. 126. Pafs Bell Tone, or Numero una. It is an Old flower, agated and marbled with gredeline and white; but unconfant: the bottom and chives of a dark blow, duffed with yellow.

CCCXI. 127. Pafs Citadell White. It is in all things like the Auge Point Vin, or Pafs Citadel, but that the white in this Flower has the Maftery, and therefore much more esteemed than that.

CCCXI. 128. Pafs Zealton of Paris. It is the best of all the Zealtons. The Flower is fair, of a deep Purple color, very well marked with white: the bottom blow, with dark Purple chives.

CCCXIII. 129. Pearl. It is an Old flower, of a bright carnation color, marked and striped with more or less white. The Leaves of the Flower twine, and stand different from others. The bottom and chives a pale yellow.

CCCXIX. 130. Fellican. When it comes right it is a pretty Flower, of a good carnation color, marked thick with smaller and greater Stripes of white: the bottom and chives of a greenish dark blow color.

CCCX. 131. Pompeza. It is a fair large Flower, conflantly well marked with fine light carnation and pure white: the bottom and chives blew.

CCCXI. 132. President. It is a round Globe'd form'd Flower, marked with purplish red, lighter and fadder yellow: the bottom and chives Violet.

CCCXIX. 133. President Royal. It is much a better Flower than the former, finely marked with crimson and white.

CCCXIX. 134. Prince of Orange. It is of a good Orange color, striped with yellow, of which color the bottom and chives are.

CCCXIV. 135. Prince of Portugal. It is a prodigey from the Fladers Widow, and differs from it only, in that the Leaves of the fat Purple Flower are lifted about the files with white.

CCCXV. 136. Prince's Turgisana. It is the best of all the Spanish Widows. It has thin Leaves well marked with two purples, and much white, which commonly has the Maftery: the bottom and chives are like those of the Fladers Widow.

CCCXVII. 137. Pinto. It is a dark fallen Flower, of a Soowy Orange color, variably marked with darker and lighter yellow, a few greenish bottom and blow chives.

CCCXVII. 138. Paragon Bernbrig, Rande la, or Angelica. It is a large long Leaf'd Flower, of a deep reddish Purple color, flaked and marked with white: the bottom and chives of a dark purple color.

CCCXVIII. 139. Paragon Alette. It is a singular good Flower, compos'd with crimson and white.

CCCXIX. 140. Preflate Brown Purple. It is a fine Flower, of a brown purple color, well marked with white, and notably differing from others.

CCCXXX. 141. Portugal Noble. It is but a small, yet a Noble Flower, finely marked with small Lines of cinnamon color, and pale straw color, with a dark bottom and black chives.

CCCXXXI. 142. Prazon. It is a pretty small Flower, well marked with deeper and lighter crimson and pale yellow: a dark bottom, and Violet purple chives.

CCCXXXII. 143. Professor. The tops of its Leaves are of the color of the Memorable, yellow towards the files, marked and whipt about with a very brown dark Purple. The bottom is yellowish, the chives purple.

CCCXXXIII. 144. Phoenix. It is a fine Flower, ofl colored, raised from Seed, and is of good effect.

CCCXXXIV. 145. Reflignant. It is a large Flower, rich colored, variably spotted and flared with white, which commonly has the Maftery, the bottom and chives are blew.

CCCXXXV. 146. Swifts of Portugal. It is a tall large long Leafed Flower, of a rich crimson color, with some Marks about the edges of the Leaves, of a deep red, flared with great Guards and Lifts of Straw color through every Leaf thereof, with a large round yellow bottom, and Straw colored chives. There are several sorts of Swifts.
Chap. 713. English Herbs.

It is a small flower, with long and very narrow sharp pointed Leaves, at first opening twisted at the ends, which after open and spread flat, is like a Star, with six Points, of a reddish Iabella color, striped towards the bottom with white. The bottom and chives are both pale yellow.

III. Of the SEROTINE:

Late Flowering Tulips.

CCCLIV. Thee are declared in the General Description, so that there is no need of repeating the same things again: and they begin to flower much about the time when the Medal are past. The greatest thing in thee, is the Mixture of their colors, in which there are no such plentiful Varieties as in the two former sorts. The chief of which, (Flowering from the middle of May to the middle of June, and sometimes longer,) are these few following.

First from Mr. PARKINSON.

CCCLV. 1. Rofe intenfior, aut remifior. A Rofe-colored, deeper or paler.

CCCLVI. 2. Rofa vulgatis, aut Saturation. A fainter, or more vivid Rose-colored.

CCCLVII. 3. Rosea rubra, vel nigro, vel nigro Orbe, aurea inclufo. A rose pink, or a dull pink with a black or yellow circle. The bottom, and red, and more deep, like black Blood, with a black or yellow bottom, or black circled with yellow, called the Sane eye.

CCCLVIII. 4. Rofa communis. The common or ordinary Yellow Tulip. A yellow Tulip with red edges.

CCCLIX. 5. Rofa guttata Sanguinea, fundo nigro, vel tofus. A yellow Tulip with red Spots and Veins, the bottom black, or various colored.

Secondly, from Mr. R E A.

CCCLX. 1. Agat Romane. It is an old Flower, most pale Rose-colored, sometimes well marked about the edges with crimson, and striped with white.

CCCLXI. 2. Gefound. It is a low small Flower, of a dark red color, striped and feathered with pale yellow at first, and, after which turns white: the bottom and chives both yellow.

CCCLXII. 3. Marbre Harlot. It is an ordinary Flower, most a Fife color, marked with Iabella, and sometimes a little white: the bottom and chives a dark yellow.

CCCLXIII. 4. Paragon-Malten. It is a bright crimson, and sometimes well marked with white: the bottom and chives both yellow.

CCCLXIV. 5. Pote Madam, yellow Crown, and Crown of France. It is a common Flower, of a good full red color, marked and crowned on the tops of the Leaves with good yellow: the bottom and chives are yellow.

CCCLXV. 6. Prince de la Mare. It is a fine Flower, as rare as the former is common, well marked with a deeper and lighter cinnamon color, and pale yellow; with a black bottom and black chives.
Salmon's Herbal.

Lib. I.

CCCLXVI. 7. Star of Venus. It is a large Flower, of a good caratnion color, marked and veined with pale yellow at half, which after runs white; the bottom and chives both blew.

CCCLXVII. 8. Tenebris. It is a large thick Flower, of a dark, deep red color, like that called De Roy, with small Veins of Peach color, a small pale yellow bottom, and dark brown chives.

CCCLXVIII. 9. Tunica Maritima. It is an inferior kind of the Patra Mdian; or yellow Crown. The Flower is more yellow than red, for which reason some call it the ripe Coat; the bottom and chives are yellow.

CCCLXIX. 10. Zeobion Seratina. It is a weak Stalk'd low Flower, of a deep red color, feathered and marked with some greenline at half, a pale yellow, which after runs white; the bottom and chives are a dark blow.

CCCLXX. The Places. The Tulip is an Alsatian or Turkish Flower, first sent to us from Dalmatia, Constantinople, and other parts of Turkey, and therefore called also Dalmatian Cap, and Turk Cap: In the Woods and Fields of Dalmatia, Cypriades, Bartha, Alpia, also in Macedon, Thessalia and Tripolita, they are said to grow naturally Wild, but with us only in Gardens.

CCCLXXI. The Times. The Precocious Flower with us in February, (as the Winter is mild,) and all March, and sometimes in a warm March or February. The Media Flower all April, and some part of the beginning of May. The Seratina Flower from the middle of May, sometime to the middle of June; but if the Summer be cold, they sometimes Flower a Month longer. However, they are an Ornament to our Gardens for more than three complete Months.

The CULTURE.

CCCLXXII. For the choice of Seed to Sow. Clafines says the White Preaxon gives the greatest Variety of colors, (tarely so from the Red;) but if the White has any mixture of Red or Purple in it, the Variety is more eminent. Next to the White, the Purple is said to be the best, and the next thereto is the Purple with white edges, so to likewise the kind with yellow edges, each of them will bring most of their own colors.

CCCLXXIII. The Seed of the best Media is to be taken from those which are light color'd, rather White than Yellow, and rarest Purple than Red; yeas White not Yellow, and Purple not Red; But of thefe again, the Spotted are the best, and the most Spotted the better. But white, and in all those, respect the ground or bottom of the Flower, (which in a Preaxon cannot be,) for they seldom have any other ground than yellow, which if the Flower be white, or whithil spotted or edged, and flaked, and the bottom blow or purple, (as in the Hotea's, and Ceel of Silver,) is beyond all other the most excellent, and yields the greatest, choicest, and most plentiful Variety. The Seed of meaner Beauties, will yield you a meaner Variety. The Seed of the red or yellow Tulip, or their divers Mixtures, are not worth the Sowing.

CCCLXXIV. The Seed of the Serrata, (which are seldom seen with any special Beautiful Variety of colors) can bring forth no rarities, and for the Reason before specified, little or no diversity at all.

CCCLXXV. Therefore to have Tulip Seed, from whence you may reasonably expect Beauti-
Chap. 713. *English Herbs.*

As many fine Flowers may be yielded from the Seed of those well marked, before mentioned, so much as have a good Collection of *Medica,* or Self-colors, observing what colors are apt to change, and by the bottoms running up into the Leaves, become well marked with several colors; I say by Sowing the Seeds of such, the Procureit may possibly be answerable to expectation: And tho’ at first they may come wholly of one color, yet if they be Orange, Sulphur, Hair, Dyes, Geranium, Violets, Shammy, or any other light or strange color, they are to be esteemed; for in a Year or two, many such have changed into good marked Flowers, and so continued in all their increase.

CCCLXXXIV. The like course is to be taken with Off-sets, to cause them to alter from the Original, as is daily done. For the General Bed, if you come from the Brown answers, the Codo Nuts from the *Zebulum,* and many fine Flowers from the Erablo-van, Tourton, and Wildens.

CCXC. The Seed of the *Procureit* does not thrive and come forward so fast as that of the *Medica* and *Serrata*; nor does it give any Off-sets in its running down, as that of the *Medica* does, which usually leaves a small Root at the Head of the other (which is run down) every Year, and besides as they are more tender, so they require more care and attendance than the *Medica,* and therefore are more to be valued.

CCXCII. And this is a certain and general rule in all *Tulips,* that all the while they bear but one Leaf, they will not bear Flowers, whether they be Seedlings, or the Off-sets of other Roots, or the Roots themselves, which have already borne Flowers; But when they have a second Leaf, breaking out of the first, it is a certain sign that it will then bear a Flower, unless some Cadality or Accident hinder it; as Foul or Rain, to nip or spoil the Bud, or some other unlucky chance befall it. The time of 5, 6, or 7, or more Years, to wait in expectation of Flowers, is a little long indeed; but if you take care to have good Seed from the better sorts of *Tulips,* you will be sufficiently compensated for your patience, from the great abundance of choice Flowers, which they will then produce.

Of the Roots.

**CCXCIII.** When you Set or Plant the Roots of your best bearing *Tulips,* if the Ground is either cold, or lies too open to the cold Northern Air, it will be well to Plant them somewhat deeper in the Earth, by which they will be the better defended, and not so liable to be poisoned by Colds or Frosts; for deep Snows and hard Frosts are apt to pierce the Procureits, and them chiefly, if they be too near the upper Crust of the Ground; and therefore many cover their Ground before Winter, with either froth, or old rotten Dung, which will admirably preserve them. The like you may do with *Seedlings,* to cause them to run on the forward, so it be after the fifth Years Sowing, but not till then.

**CCXCIV.** If you remove the Roots after they have flowered their Fibres, or small Strings, which grow
Salmon's Herbal. Lib. I

grow under the great round Roots, (which is from September, till they be in Flower) it will be very dangerous to them; for by removing them when they have taken full hold in the Earth, you hinder them for flowering that Year, and it would be as the next Year too, and hazard their perishing withal. But after they are risen to Flower, you may safely take them up if you please, and remove them without danger, unless it be a Young bearing Root which in so doing, you will much, under, by reason, bearing new its full Flower. It is yet very tender.

CCXCIV. But all Tulip Roots, when their Stalks and Leaves are dry, may safely be taken out of the Ground, and be to kept, (so they lie in a dry, and not in a moist place) for six Months, without any great harm, and sometimes they have been kept out of the Ground for nine Months, and yet have proved reasonably well, but then you must know, that they have not been Young, but the Older Roots, and have been orderly taken up and preserved. The dryer you keep a Tulip Root the better, so you let it not lie in the Sun or Wind, which may pierce and spoil it.

CCXCV. When the Roots are ready to be taken up, do it in a fair dry Day, and if the Ground is hard or stiff, do it with a long hollow Trowel fit for the purpose, but in light or soft Ground, it may be done with the Hands only.

CCXCVI. Being thus taken up, lay them on Papers on which the Names are written, and place them open upon some Bounted Floor, where they must so remain to dry, about twenty Days. Then take away the dead Fibres, and loose outward Skins, and such Off-sets or young Roots, as will easily part from the old, which done, it will be necessary to wrap up your belt Roots especially, in trefh, well dried Papers, and on the outside to write the Name of the Flower, which may be kept with its Off-set with it, until the middle of August, at what time, the Off-sets are to be fat in a good Bed prepared for that purpose. But the old bearing Roots must be left in the Papers, till the proper time is come for Planting them.

CCXCVII. When you have secured your Roots in Boxes, it will be necessary often to look over them, lest any should be mouldy or grow mossy, as it often happens. Then the Mouldiness or Moisture, is gently to be wiped off, with a dry wooden Cloth, and the Root gently dried before the Fire, and to put up again into fresh Papers. Well, and in the proper time is come for Planting them.

CCXCVIII. Your Roots being thus carefully disposed, it will be time to prepare a place to Plant them in, which for the bell bearing Roots, will be in a Bed, or Beds (according to your Store) which let be about a Yard in breadth, and in length according to your own liking, and as your Ground will permit; which let be Border'd with Rails or Boxes, and till'd two feet deep, with the lightest, frittiest, and frittiest士ed Earth you can get.

CCXCIX. These Beds may contain 5 or 6 Roots in every Row, crofs the breadth of the Bed, which with a Line drawn, may be exactly divided, and the Roots placed accordingly: But before they be Set, the Roots are to be numbered from 1, to 50, 100, 200, &c. more or less, in a Book, with their proper Names to the Numbers, and then to be Planted according to the order of the Numbers in your Book, by which they will be known what they are, both before, and after the time of their bearing.

CCC. In placing these Roots, some set the faddell colors towards the fides, and the lightell in the middle, but a variable mixture is most pleas- ing, not feeing too many daily, or light colors together, tho' different from each other; nor mingle the Flowers with the Media, but placing each for in a particular Bed by it fell.

CCC. When thebe Noble Tulips begin to rise up, they should next be covered the Bed with a this Canvas Tilt, (supposed with a small kind of Frame) so as not to touch the Flowers, which may be put over them in cold Nights, to prevent the North-East Winds or Frosts, from nipping and hurting the Buds, by which the Beauty of the Flower may be spoiled, as also to defend them in the Day-time from Hail, great Rain, and Vertauts heat of the Sun, by which means they will continue longer in Flower.

CCXC. This Tilt or Canvas, may be taken off before the time of flowering in fair Days, that they may now and then be reviewed with the Sun Beams, and also with gentle Showers, and then be covered again in the Night: But when fully blown, let them not have above an Hours Sun in the Morning, and as much in the Evening, if the Seafo be hot, if the Weather is cold, you may permit them a longer Sauning.

CCCII. The more ordinary sorts may be set in Borders, or in spaces in Knots, without taking any account of their Numbers, Names and Places, unless you fo please: And if the Ground is good in which they are set, they may stand two Years without taking up, but not longer, in respect to their Off-sets, which are removed, which if not removed, will make their Flowers to be small and weak, and withal exhaust very much the Nourishment of the Plant. And before they be set again in the same place, the Earth must be changed for that which is new and fresh.

CCCIII. After the Flowers are fallen, break off the Heads or Seed Vellits of every Flower, except of such as you reserve for Seed; so will the Stalks dry down the Rooters, and the Roots will preserve their Strength the better, and be even forthwith thereby.

CCCIV. Some of the late Tulips will sometimes be infected with Diffeats, notwithstanding our greatest Care and Diligence in their Preservation, which happens to some Roots while out of the Ground, and to others after they are Planted. If the mischief is before the Root is Planted, the Root will appear shrivelled or crumpled on the outside, and feel soft and sporgy, which is a sign that it is in a Conformation, or withing condition, which to prevent you must put in a Time, and in the Earth, the Root will now and save, you must mix Wood Soot, dry, mixed, with Sand about it, covering the place with an Earthen Pot, the bottom turn'd upwards, to keep it from Wet, till the Fibres are come forth, which will be by the end of September, or beginning of October, or not at all. These decayed Roots thus managed, (to some of the outward Vellits rot and confurne, the middle and Heart remaining found) will revive again, and in two or three Years bear Flowers as formerly.

CCCV. If the dead after they are Planted, and have put forth Green Leaves, if any of them begin to fade and wither, you must open the Earth to the bottom of the Root to find out the cause, and if the Root is mofit and small, it is pull Cure or help: But if it be any thing hard, it may be covered, by putting to Wood Soot mixt with dry Sand, and covering it as in the former, leaving the place somewhat open, that it may dry downwards the floore. In hot Days, take of the Pot, and take up the Root as soon as the Fibres are
are gone, and keep it in Wood or old Oven, near the Fire: Afterwards for it again, according to the directions in the former Paragraph or Section. By this means many choice Flowers or Roots have been saved, which otherwise had been undoubtedly lost.

CCCVI. Contrariwise, we purposely make some Roots Sick, by taking them up a little before they begin to Flower, and laying them in the Sun, to share their Luxury, and cause them to be better marked the next Year following. This has been often done with the Aga, Rosette, Papus, Cavaliis, Papi Cineris, Papi-Odorata, Tulipans, Witches, and such like ordinary Flowers, by which means some of them will come to be very well marked, so as that they might be taken to be much better Flowers than indeed they are.

CCCVII. When you Plant your best Tulips, you must Yearly make a provision of Manured, sifted, light, sandy Earth, to make new Beds for them, or by taking away that in which they grow, and supply the place with this new provision: For if Tulips be kept twice in the same Earth, they will languish and decay for want of agreeable Neighbourhood. But if you have hereof Ot or Near-Dung mixed with Sand, which has lain on an heap two or three Years: If this Day be Sifted, and in Angouleme well mixed with the Earth of your Bed, and this be any thing good and temperate, it will be sufficient. Be this very means, Mr. Recafsays, that he had for his best Tulips, for twenty Years successively in one Bed, and that they profpered to his Will, and oftentimes beyond his Expectation.

CCCVIII. Some Gardemers give us another kind of Compot, which they make after this manner: Take an hundred Bullets of yellow Sand, fourscore Bullets of red Mould well mellowed, three score Bullets of Kitchen-Garden Earth, which mix altogether with a Shovel, and after a Month lying together, put it in a Scoop, that the Motion may be well made, and thus spread it once a Month, for 12 or 14 Months together, which then keep for use. The more this Earth putteth to the Shoon, the lighter and better it will become, and the more agreeable to your Flowers.

CCCVIX. Before this Compot, or Compound Earth, is laid on the Natural Soil of your Beds, you must consider, that if the Soil be wet or moist, (both which are Enemies to the Tulip,) you must make it dry, or dig the Bed you design, taking out a Foot and half of the Earth, and then fill up again with this Compound Earth, mixed with an equal quantity of Sand; or if the Soil of the Garden be naturally dry, light and sandy, then you may have the former trouble of digging up and removing the Earth, and only cover it with the said prepared Earth, about half a Foot thick.

Of the BULBS, nod young BULB-Roots.

CCCX. Your Beds or Parterries designed, being thus prepared, you may then Plant upon them your Bulbs or Young Roots, as before directed, taking care, that each Bulb or Young Root, be well covered about three Inches deep, with Earth on all sides, which may be done from the middle of October, to the end of December.

CCCXI. As soon as ever they are put into the Ground, you must not neglect to cover them with large Straw, or dried Dung as is before hinted, to secure them from Frosts, and severe cold Weather; but then they must be uncovered again, as soon as the Frost and Cold is gone.

CCCXII. When March is come, and you perceive that they begin to shoot, take care to Water them, and to see that they have sufficient moisture, but how much, or how long you may Water them, is wholly to be left to your own discretion. And if Weeds grow, let them be continually pluckt up, because they will, (if left,) draw the Nutriment from the Roots of your Flowers.

CCCXIII. These Bulbs of the Tulip-Roots, are to remain in the Earth for one Year only, during which time, they must be carefully Cultivated, but at a Years end, they must be removed in the following manner.

CCCXIV. Take a Dib-planting Scoop, which thrill into the Ground at a convenient distance from the Bulb, and a little below their Fibres, by which means, you may be able to take them up safe without Wounding them, or separating the Earth from them, and continue to do so till they are all dis- planted.

CCCXV. The Bulbs being out of the Earth, and made clean from the Earth thicking to them, carry them into an open place for a Whiles, (for these Roots are so tender, that they will not endure the Sun, the least heat being apt to dry them too much,) and be sure that they be not heaped up one upon another; for thereby it may happen, that those underneath may be heated, which would certainly do them harm, because it might give motion to the Sprout.

CCCXVI. When the Season for Planting the Bulbs, or Young Roots is come, you must manage it as is before directed, after having separated the Suckers, which you are to Plant in a Nerlye made of the same Earth, as we have ordered for the Bulb it self, at 3/10, 4/10, and 4/10, after going.

Of the Suckers of a Tulip-BULB.

CCCXVII. The Suckers of the Tulip-Bulbs are Planted chiefly for the increase of the kind, and not so much for Ornament, so that there need not be so much care to fix particular Beds for them, as for their Bulbs; yet they ought to be Planted orderly and in Rows, and at 5 or 6 Inches distance one from another, and 2 Inches deep in the Ground, covering them smoothly with your Hand, after which, you are to take the same care of them as you do of your Bulbs.

CCCXVIII. How long they are to continue in the Ground, is the next Consideration: Some say, two Years, for that day they, the first Year they only sprout, and the second Year they multiply; Others fay three Years, for that the third Year they come to such a Perfection as to produce Flowers, which are to be most Confinant to the Nature and Property of their Plants.

CCCXIX. To prevent their Suckers growing dry, from the time of separating them from their Bulbs, you must put them into Moss, in some open place, till you Plant them again; and so used, they will thrive admirably.
Of the Flowers.

CCCCX. The Tulip whole Cup is leaft Convex, is peduncular to that which is very much Convex, if the Fibrillae in the Cup far more Beautiful than a sharp, the bottom being also proportioned to the top, but the bottom is much more than notion of, because the stripes or Strakes which arise from it, are generally of the finest colors.

CCCCXI. If its Form and Green is of a mild Light green, has a very fine Liptum, and the green appears a little frizzled, or accompanied with small Strakes, if its color or colors are Luftrous, and appear like Silt or, or of a Flame colored, Red upon a White Ground, or is of divers colors with Strakings, or yellow frizzled with grey, such as those are esteemed, and accounted of the better kinds; and so much the more, if the color is not Cellually blended, but its stripes are well separated, looking agreeable to the Eye.

CCCCXII. The color of the chives are not much material, in respect to its Beauty, but a good Tulip ought to have its Thrum or of a brown color, and not yellow: And tho’ it may appear Fine at its first opening, you ought to suspend your Judgment concerning the same, as to its Goodness and Value, till a 3 or 4 day be past, betwixt you can rightly make an Observation: But this is certain, that in a well formed Tulip, the three lower Leaves ought to be longer than the three upper; and this when it opens, betwixt those Leaves turned either inward or outward, so that their Leaves are too small or thin, it is of no account or Value at all.

CCCCXIII. The Longitudes. They are all, as in respect to heat or cold, dried or milled; but as milled are only most in the beginning of the next degree, Aprili, Stromatic, Cubilinct, Angulicinc, and Spann LONGOGENIC.

The upper part.

The Virtues.

CCCCXVII. The Liquid Juice. It may be clarified with Whites of Eggs, or used simply of at Mai, being immediately extracted, Dole from one Quince to three, mix it with a Glass of Rum every Morning taking, and every Night going to Bed. It cools the Worm, and Inflammations of Generation, increases Seed, provokes Luf, and is used to cause Fruitfulness in both Sexes, and cure Impotency in Men.

CCCCXVIII. The Dejection. In Milk, or in Water. It has all the former Virtues, but is much weaker. If it is made in Water, though it be given mixed with an equal quantity of generous Wine, and to taken Morning and Night, to half a Pint of the Decotion or more.

CCCCXIX. The Coaer. The Root is boiled or baked light, then beaten up with Sugar. It is of the fine purpure, Nourishes much, is Refreshing, and is probable for the Cure of a Perfit, or Ulceration of the Laups, and a Pining Consumption. Dole as much as a Large Walnut, Morning, Noon and Night, drinking after it to wash it down, a Glass of Palm-Wine, or Old Malaga, and sometimes for change, a draught of Milk warm from the Cow.

CCCCXX. Sanguis Satyrionis, the Blood of Satyrion. S 4 .aj. makes it after this manner.

ble de Sanguis Satyrionis optimis medicamentis, quos in Abortus marvarum præbent contundendo, donee formam pulpe fornicant: Ad libras quatuor bujas pulpe, adscire medulla pani Seclali, & pris. Vitis, et, ad librum ac. Omnibus utrato pulpe mixto, ut rario utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusque utriusq
Chap. 714. English Herbs.

TULIP BASTARD.

Chap. DCCXIV.

III. The sweet, or Armenian Tulip, much differing from those in the former Chapter, its Root is Bulbous (as other Tulip-Roots are,) and something longer than the Root of the fourth Kind, or yellow Bolonian following. It bears three, (sometimes four,) small, long, and somewhat narrow green Leaves, altogether at one point, or place, the Stalk being Naked without Leaves, and not high. At its top it bears one Flower, which is small, and like to an ordinary Tulip, but something more yellow, tending to an Orange color, with a black bottom.

IV. The second, or greater red Bolonian Tulip, its Root is plainly seen to be differing from all others, for it is longer, and has not so plain an Eminence at the bottom thereof, as the former Tulips have, but more especially, because the top is plentifully sowed with a yellowish Silk-like Wooliness, its outside, or Skin of it also, is of a brighter or paler red, not so coarse to be parted off, and is not under Ground, but down above, in ways, (more especially in a Country Soil and Air, where

The Descriptions.
Salmon's Herbal. Lib. I.

where it will increase abundantly, the not so in our London Air, and Forck Grounds: some like to the yellow Bolontian Tulip, (at Sect. VI.) following. It flowers out of the earth with broad and long Leaves, but neither so broad, nor so white or Neatly a given color, as other Tulips, but more like to the Serrur, or late Flowering Tulips, for that this may safely be denominated by its Leaf, from any other Tulip above Ground, by such as are skill'd in these Flowers. It bears three Leaves upon its Stalk, (very rarey four,) and for the Red, and not so eminent as the Early or Late Red Tulips, but its Leaves are always long, and something narrow, having a large black bottom, made like unto a Choven, and whole point is green color in the middle of the Leaf, higher than in any other Tulip. The bloomer is of a pale red color, nothing so lively as in the former Early or Late Red Tulips, and a white or yellowish (being wholly not so fresh or clean,) at the edges, and not so vivish. The Stalk bears one Flower, which is larger, and more open than the five others, and (being wholly white, or of a deep red color, or efe variously mixt, with a fine reddish Purple,) the bottoms being yellow with Purpleish rings, rips with blackish Venetian. It does right, caltly thrive in this our cold Climate, and prospers not well, unless a great care is taken of it.

X. The eighth, or Candy Tulip. Its Root is small, and something like to the Narbone, or Yellow Tulip, at Sect. XIII. but a little bigger. It bears fair broad Leaves, of a greenish color, and not so vivish. The Stalk bears one Flower, which is larger, and more open than the five others, and is either wholly white, or of a deep red color, or efe variously mixt, with a fine reddish Purple, the bottoms being yellow with Purpleish rings, rips with blackish Venetian. It does right, caltly thrive in this our cold Climate, and prospers not well, unless a great care is taken of it.

XI. The ninth, or Italian Tulip, greater and lifted. Their Roots are like to the yellow Bolontian Tulip, but the Stalks rise not up so high as in that. The Leaves of both sorts are wrinkled in and out at the edges, or made like a Wave of the Sea, being nearer the Ground. The bloomer is a reddish brownish or reddish on the back, and in the middle of the three outward Leaves, the edges appear yellow. Both these Kinds do much resemble the Narbone Tulip, and they differ one from the other in nothing, but that the one is greater and the other leffer.

XII. The tenth, or Portugaluese Tulip, or Dwarf stipul Tulip. The Dwarf Tulip is of the same kind with the green, and ether Italian just before described, and the Nationence, or Dwarf yellow Tulip following, there being no other difference in this from them, but that the bloomer of this has but three red planets, but the other has five.

XIII. The eleventh, or Narbone, or Dwarf yellow Tulip. This is very like to the yellow Bolontian (at Sect. VI. above,) as well in its Root, as in the Leaf and Flowers, although in the color thereof, being yellow. The only difference is, that it is in all respects leffer and lower, and not so apt to bear, nor so easy to increase by the Root.

XIV. The twelfth, or white Dwarf Tulip. Its Root is like the others, its Stalk is longer than other Dwarfs, and the bloomer is also larger, (being of a white color,) than other sorts of white Tulips, but the Leaves thereof are narrower.

XV. The thirteenth, or Perfulen Tulip. Its Root is small, covered with a thick, hard, Blackish Shell or Skin, with a yellowish Wellsidge both at the top and under the Shell. It is a rare Plant, but is thought nearly to agree with the Bolontian and Italian Tulips, in its Root, Leaf and Flower. It rises out of the Ground at first, with one very long and small round flower, which is three or four inches high, does open it self, and flourishes forth another small Leaf (as long almost as the former) breaking out of the one side thereof, and after it is a third, and sometimes, the rarely, a fourth and a fifth, but each shorter than other, which afterwards become of the breadth of the Dwarf yellow Tulip, at Sect. XIII. aforegoing, or something broader, but much longer than any other, and blossoms more hollow, and of the color of the Early Tulips on its inside. The Stalk rises to be a root and a half high sometimes, bearing one Flower of fox long and pointed Leaves, of the form of other small Tulips, not much bigger than the yellow Italian Tulip, but it is wholly hidden on the inside and outside of all its Leaves, having that on the backs of the three outward, from the middle

have their edges for a good breadth, of a whiteish, or whitish yellow color, and in others the Leaves are tittered or part with whitish yellow and green. The Stalk rises up forcibly to the height of a Prince, and bears a blower, not unlike to the Early Tulips, in some of a reddish yellow color, and in others the color of the ground or bottom, and in others of several other colors. The Seed is so like to that of the Prince, but that it is not so well of the flower.
middle towards the edges, there is a flow of a brownish blight, or pale red color, yet deeper in the midst, the edges remaining wholly white. The bottoms of all these Leaves, are of a dark, or Brown Turnep, and the Closes and Tips of a darkish purple Turnep. It seldom bears Seed with it, but when it does, it is small like to the Bohonian or Nardone Tulips, nor is it so plentiful in putting or setting off by the Root as they, and seldom Flowers after the first Year.

XVI. The Places. Their Names flow their Native Countries, being Nurt up with us only in Gardens.

XVII. The Times. They are all Precoces, and Flower here in England, tho' all the time of the Flowering of the Early Tulips.

XVIII. The Qualities, Specification, Preparations and Virtues of these, are the same with those declared at large, in the last foregoing Chapter, to which you are referred.

CHAP. DCCXV.

OF TURNEP Garden.

I. THE Names. It is called in Greek Πεπρωτος: of the Lacedemonians, Twarf; of the Boeotians, Swat; in Latin, Raphum, pl. Rapum: and in English, Turnep, and Turnep.-

II. The Kinds. There are 1. The Garden Kinds, of which in this Chapter. 2. The Wild Kinds, of which in Chap. 716, next following. Of the Garden Kinds there is 1. Rapum rotundum album communis, The common white round Turnep. 2. Rapum rotundum rubrum communis, The common red round Turnep. 3. Rapum longum vulgare, The common long Turnep. 4. Rapum latum, The yellow Turnep.

Turnep Garden round.

The Descriptions.

III. The first, or common white round Turnep. Its Root is round, (sometimes of a Globular, and sometimes of a flatter round Form,) and of a white color both without and within, with a small Pigment like Root at its bottom, or underneath it: The rounder sorts are said to be the stronger or sooner; the flatter kinds the faster or better; but there are very good and short rooted of both sorts. From this Root spring up many large and long, rough, green Leaves, with deep and uneven Gashes on both edges: from among these Leaves, rises up the Stalk, about two Feet high, spread at top into many Branches, bearing thereon yellow blossoms, which turn into long Puds, with blackish round Seed in them.

IV. The second, or common red round Turnep. Its Root is of a fair red color on some parts of the outside, the other parts being white like the former, but of a pure white color throughout within, as the first also it. This in its Leaves, Stalks, Flowers and Seed, is exactly like the first. Described, but its Root is larger. This Matthiasia grows in the Country of Anamia, (where he had seen an infinite number of them,) to such a bulk, as to have weighed Fifty Pounds weight a piece, and some an Hundred Pounds weight to one (which is almost incredible) but we see this kind is apt to grow very big with us in our cold Climates, and therefore possibly it may grow or extend itself to a far greater Magnitude in those warmer Climates, the Soil being also agreeable to its Nature, and facilitating such an extraordinary Production.

V. The third, or common long Turnep. Its Root is round, but not Globular, and long, almost in some like a Cylinder, and in others more peaked or Spuce-like, being of a white color both on the outside and inside. The Leaves, Stalks, Flowers and Seed, are like to those of the first described.

VI. The fourth, or yellow Turnep. Its Root is like to the first common kind, but changes to be more yellow, and in some comes near being of the color of a yellow Carrot; otherwise whilst it is growing, in respect to its Leaves, Stalks, Flowers, and Seed, it is hard to be discried from the first common Garden Kind.

VII. The Places. The Turnep is a Manured Plant, and grows with us only in Gardens, or Fields kept on purpose for the same. Those which grow at Hackney, near London, are less than many others, and are thought to be sweeter than any of the other Kinds which grow in England. They delight in a light and sandy, light, loose Earth, and there grow well.

VIII. The Times. They are Sown in the Spring, as also in the end of August. They Flower and Seed the Second Year after they are Sown. Gerard says, that those which Flower the first Year are a degenerate Kind, which the People about Hampstead in Cheapside, call Mad-neps, from their evil Qualities, in causing a Vertigo and Frenzy, or kind of Madness for some little while. But Parkinson says, that those Mad-neps are a Species of the Purpep, as we have declared in Chap. 544. Sect. 7, along with this Book.

IX. The Qualities. The Roots are hot and moist in the fifth degree, Aperitive, Digestive, Anodyne, Diffusive, Suppurative, Pectoral, Nephritic, Cholletic and Amelopathic. The Seed is hot and dry in the third degree, Aperitive, Alleviative, Digestive, Diuretic, Stomastic, Pecto. 7 N 2 tel.
Salmon's Herbal.

Lib. I.

tal, Nephritic, and Alexipharmick; having much the same Qualities, Specification, Preparations and Virtues of Mustard-Seed, to which we shall refer you.

X. The Specification. It, viz., the Root, removes Obstructions of the Lungs and other Vitious, breeds a laudable Clayle and good J uices, and cures Rheumatism, Gout, and Contusions.

XI. The Preparations. You may have, 1. The Vinear Juice of the Root. 2. A Spirit from the same. 3. A Liquid Juice or Sapa. 4. A Liquid Juice by expreffion from the Baked Roots. 5. A Decolation of the Roots. 6. The Simple Pulp, made by Baking or Boiling. 7. The Expreffed Oil of the Seed.

The Virtues.

XII. The Vinear Juice. It is made of the Expreffed Juice of the raw Root, by being first beaten to a Pulp in a Mill, or otherwise, and then expreffed out after, which in fome it is put in wooden Vats or Vessels, as J uices of Grapes, Apples, Pears, &c. It is a pleasant Liquor, and may be drank as Ale, Beer, Cyder, Perry, Wine, &c. at Meals and other times to quench Thirft. It is Diuretick, Cordial, and strengthens the Stomach and Bowels.

XIII. Spiritus Reparator, The Spirit of Turnep. It is drawn from the aforesaid Liquor, as you draw Spirit of Wine from Wine. It has much of the fame Virtues with Spirit of Wine, and may be drank alone, or with Sugar, as you drink Brandy to warm the Stomach, cheer the Bowels, and revive the Spirits. With it you may make Punch with Water, Lime-J uice and Sugar, as you do with Brandy, with which being drank, will have the fame Effects, and if taken plentifully or frequently, will, about half a Pint at a time, 1. In the Morning fhaling. 2. Half an Hour before Dinner. 3. At four in the Afternoon; and 4. At Bed time, and be continued in the fame manner for 10 or 12 Weeks together, it will Cure a Pining Contemplation. And may be used in Chymical Operations, for making Tinctures, Extracts, Cordial Waters, Spirits, &c.

XIV. The Liquid Juice or Sapa. It is done by Expreffion out of either raw Turneps, or after they are Baked, or Boiled, or in their Skins; and this Juice may be taken Simply as it is expreffed out, or otherwise made into an Effence, or Sapa, and is kept for farther use. These Preparations are all Pectoral, Chyli tick, Nutritive, and relifiers in deep Contemplation.

XV. The Decolation of the Roots. It is good against the Rickets in Children, Gouts, Rheu matifms, Qua ran Argues, Althana's, Coughs, Wheezings, Shortnefs of Breath, Contumions, Incracfe-Seed, expels Sand, Gravel, and Turratous matter in the K eims and Bladder, and provokes Urine, being drank daily as the usual Drink.

XVI. The Simple Pulp of the Root, made by Baking or Boiling. If it is eaten without Vinegar or Salt, only of itelf, or mixed with a little new Cream, or Milk, and some pure fine white Bread, and the Patient continues bifolful to Live of it for 6, 7, or 8 Weeks, eating no other Food, neither Flefh nor Fowl, Pickles, Savices, or Sweet-Meats, during that space of time, and drinking in the mean while only a little Decotion of Turneps, it ef feutially cures a Rheumatift and Gout, as alfo the Scurvy and Contumtion, altho' the Patient is in a very Deplorable Condition, it is also a very good Diet to be observed of such, as have come out of a Salivation, or other Course for the Cure of the foul Diiftice, doing truly much more than could be reasonably expected, in completing the Cures of those Distiffes, beyond many other things of much greater Name.

XVII. The Expreffed Oil from the Seed. Being mixed with Vinear Treacle or Mahrifate, it is singular good against Poifon, and malign and in feuous Diiftices. Gerard fays, that in the Low Countries, as Holland, Zeeland, Flander, &c. it is given to caufe the After-pains of Women in Child ben; and they give it both to kill and expel Worms in Children: And being wafhed with Water, and then anointed upon the Skin, it takes away its Ruggnedness, and makes it soft and smooth.

CHAP. DCCXVI.

Of TURNEP WILD: or, Wild R A P E.

I. THE Names. It is called in Greek Λαυρομένα Dierorifida, and in Latin Lamponia Althana, the Rape of Sylvefire, and Rapiftrum. (Of Syl vefire Dierorifus, and in English Wild Turnep.

II. The Kinds. We have two sorts pretty common with us, viz. 1. Rapum non Buchifanum, Rapum majus Sylvefire, The greater Wild Rape or Turnep; and this is that Rape which yields the Rape-Seed, or Cole-Seed, out of which Oil is drawn in Mills by Expreffion, for many Mechanick uifes. 2. Rapiftrum Sylvefire, and Rapiftrum minus, The latter wild Rape or Turnep.

Turnep Wild.
Chap. 717. English Herbs.

The Descriptions.

III. The first, or greater Wild Turnip. Its Root is long and slender, with some few Fibres adhering to it. Its Leaves and Stalks are very like to those of the Garden long Turnip; but they grow thicker and more plentifully from the Root, and more crumpl'd and crinkled in the middle, and more rough in the buds, and in the Flowers, Pods and Seed, it is much silius, and in the whole in its appearance, differs not much from it: The Seed is called Rape-Seed and Cole-Seed.

IV. The second, or lesser wild Rape, or Turnip. Its Root is also long, and much leafier or slenderer than the former, with some few Fibres arising from it. Its Leaves are smaller at bottom, and not jagged, but a little wavy. It is not so plentiful in Leaves as the former, but growing fewer, they are more spaced upon the Stalks and Branches. They grow upon a very long Florifhing, and the higher they grow, are more deeply curved on the edges, and sometimes as it were a little jagged. The Flowers are yellow, after which come pretty long, but small, and sharp pointed Pods, in which are contained small flat Seed, of a nutbush yellow color.

V. The Places. The first is found wild in many Countries, but for the part which is made of the Seed, we have in England, as also in Flanders, and other the Low Countries, Manure it, and Sow it in Fields, and fill therewith vast Tracts of Land. The second grows wild also in our Country. Farkenfion says, he found it going from Shoresth by Bedalton-Green, to Hackney.

VI. The Times. They flower in May and June, and the Seed is ripe in July or August, at what time they reap their Fields Sown, with which they reap Wheat and other Corn.

VII. The Qualities. The Seed, which is that which is only sold, is hot and dry in the beginning of the second Degree, but the Seed of the latter kind is bitter, and as it grows hot as Mustard-Seed, and of which some make Mustard, or mix it with Mustard-Seed, and then use it for that purpose. It is Alterative, Digestive, Diuretic, and strongly provokes Urine.

VIII. The Specification. It helps the Difficult of the Stomach, (I mean the Seed of the latter kind,) provokes Urine, opens Obstructions of the Reins and Bladder, and gives ease in the Strangury.

IX. The Preparations. Of the Rape-Seed, or Cole-Seed, is made, An Oil, by Expression in a Mill, of the latter kind, An Infusion in Wine. And, a kind of Mustard or Sauce for Meat.

The Virtues.

X. The Exprefsed Oil of the Rape-Seed or Cole-Seed. It is used in Lamps, and therefore called Lamp-Oil, for which purpose, it is much better than Tallow-Oil, which is made out of Whales, because it flinks not like that. It is also for this to make Soap, whipted, instead of Oil Olive. And in divers places in Germany, Flanders, and the Low-Countries, they use it to fry their Fiff in, &c. It is fearfully as all used in Fieck, yet given in Quantities, it opens Obstructions of the Lungs, and makes the Belly soluble, giving eile in the extreme pains of the Choic.

XI. The Infuion of the Seed bruifed, of the latter kind, in White Port Wine. It powerfully pro-

vokes Urine, opens Obstructions of the Urinary Vesicles, and expels Sand, Gravel, and Tarmatif matter lodged in the Reins, Ureteres and Bladder, and for that therfore gives ease in the Strangury. You may infufe 3 Ounces in a Quart of Port-Wine, and after 3 or 4 days Digestion, drink twice or thrice a day, a quarter of a Pint of the clear Wine: If it be freerected with Syrup of Marsh-Mallow, it will be so much the more effectual.

XII. The Mustard or Sauce made of the Seed. It is made as you make Mustard of Mustard-Seed. It strengthens and warms the Stomach, causeth a good Appetite and Digestion, and pretty strongly provokes Urine: But it is not astringent; so pleasant as the Mustard made of Mustard-Seed, because of its bitterness, which it losses not in a long time.

TURBTH, see it in Lib. II. Chap.
TURMERICK, see it in Lib. II. Chap.

C H A P. 1205

OF TURN SOLE.

I. THE Names. It is called in Greek, Φυτονisations, (quom Omnes homines com foli circuitum habent,) or as Μιτατονisations, have it, because it Flowers in the Summer Solstices;) as also Scolymus, Scleropium, (qui foli Phleum Scleropium caudis effe) in Lattine, Heliotropium, Scorpions alium Gefferii, Seligerium, Veraevaria (A tellen- dix verres) and Herba Comeris in English, Tursole.

II. The Kinds. There are several sorts of this Plant, as 1. Heliotropium, Heliotropium majus, Scorpioides album Gefferii, Herba comerii major Lanierii, but most properly Veraevaria, Our com-

mon greater Turn sole, or Watt-Root. 2. Helio-
tropium majus fulcnum Clqui, Podemus & Gefferii, Heliotropium hani, foerum Clqui, Lademamii, Heliotropium minus Jactianum Bleichii, The great creeping Tursole. 3. Heliotropium minus repetus Mayhii, Heliotropium minus fulcnum Quesen Gefferii, Veraevaria altera minor Lademamii, small Tursole. 4. Heliotropium Triuncium Pliniii, but some add unto it minas;) Herba Oitii Comeris, The Dying Tursole. 5. Heliotropium Vindemium Tur-

sole, Flos Solti Nurembergianus, Jurinius Harrius, of which we have already treated, in Chap. 345. aforwaring.

The Descriptions.

III. The first, or our common greater Turnsole. Its Root is small and thin, perishing every Year. It rises up with one upright Stalk, about a Foot or more high, dividing or spreading it self out almost from the bottom, into several smaller Branches, of a hoary color. At each Joint of the Stalk and Branches, grow two small broad Leaves, something like to those of Calaminet, and thinner than the greater Bells, something white or hoary also. At the tops of the Stalks and Branches, grow many small white Flowers, consisting of four, and sometimes of five very small
Salmon's Herbal.

Turnfole Great.

Turnfole Small.

Turnfole Dying.

Small Leaves, set in order one above another, upon a small crooked Spike, they grow pretty thick together in rows, upon one side of the Stalk, which Stalk does bend or turn backwards,almost like a Scorpions Tail (whence came that other Name Scorpiloda,) which opens by degrees, or grows more straight, as the Flowers begin to open, after which, in their places come small corner'd Seed, four for the most part budding together, which shedding it self, rises again the next Spring.

IV. The second, or greater creeping Turnfole. Its Root is small and fibrous, perishing every Winter as the former does. This in the Judgement of Clusius, is in a manner the same with the former.

or greater common Turnfole, because it is so like it in most particulars; but herein it differs, that it has many more, and flenderer Stalks, not standing upright as the former, but a little leaning down to the Ground as it grew. The Stalks and Leaves are lfer, but hoary in like manner. The Flowers are white, and grow upon crooked, spited Stalks, bending like a Scorpions Tail, as the other; and the Seed is smaller, flandering stily, or but two together.

V. The third, or small Turnfole. It has a flender, fibrous, perishing Root, which sends up weak, small, slender Twigs or Branches, growing very low, and lying almost upon the Ground; having thereon many small Leaves like the other in Form, but three times less in Magnitude, neither are the Stalks or Leaves white or hoary as the former, but of a dark green color. The Flowers are much smaller, and yellowish, not growing in long, crooked, or bending Heads like the others, nor at the tops of the Branches, but coming forth at the Joints, upon very small Vointhills, some above the Leaves, and some under them; which afterwards turn into small round Heads or bot-

Flowers, which quickly perish, and fall away without growing any Seed, like herein in the Vicinity, or Palma Christi, called the Great Spurge, &c. in the same manner also, as the Joints with the Leaves, come forth the Root or Berries, three always, or for the most part, set or joined together upon a Voin-

flath,
Chap. 717. English Herbs.

flath, which is sometimes longer, sometimes shorter, as it may happen, which Berrins are of a blackish green color, and of the apfelike within, which is contained Ab colored Seed, which if the leek be suffer'd to grow too warri-ripe, and be dyed in the Sun, will fall out of themselves ap- on the Ground, and become againe in their Natural places the next Year, by which means is eonstantly renewed its self. These Berris when they are at their full Maturity, have within them, that is, between the ownen Skin, and inner Kernel or Seed, a cer- tain Juice, which being rubbed upon Paper or Cloth, at first appears of a feath and lustrous Green color, but presently after changes into a kind of bloodish Purple.

VII. The Places. Thefe all grow in Spain, Italy, France, and other hot Countries, but the first and second thrive very well with us: The third, with Care, is Managed in some of our Gardens: The leat I had growing in one of my Plantations in Carolina, where I found it would grow and thrive as well as in Spain or Italy.

VIII. The Times. They all of them Flower about the Summer Solstice, or when the Sun enters into Cancer in their Native Places, and the two first with us, but the latter scarcely bear any Seed here in England, by reason of the coldness of our Climate.

IX. The Qualities. These Turnfole are all of them hot and dry in the fifth degree, Althentic, Altringen, Caradice, and Alexipharmic.

X. The Specification. They are said to be Spec- cifics against Fluxes of Blood, and of the Belly, Stoning of Scorpios, Bitings of the Ploungum, Poison, Stone or Gravel in the Reins or Bladder, Strangury, provoke the Courts, cause speedy and easy Deliverly to Women in Travell, kill Worms, cure Agues and Fevers, give eafe in the Gout, In- fiamation of the Brain, the Bitings of Serpents, and all other Venemous Creatures; and being rubbed upon Worms, or other like hard Excrences or Kernels, it is said to consume them by little and little, and to take them away, by often using the same.

XI. The Preparation. You may have there- from, 1. The Juice of the Green Herb or Plant. 2. The Simple Deconcentration. 3. The Compound Deconcentration. 4. The Seed. 5. The Calomel. 6. The Turnfole Chars.

The Virtues.

XII. The Juice of the Green Herb or Plant. It is said to purge Choler and Plegm, and given to one or two Spoonfuls in Wine, it is good against the Stoning of Scorpios, the bruised Herb being also applied to the parts hurt. It kills Worms in the Belly, both long and round, and is good, being mixed with a little Salt, against Worms, Warts, and hard Kernels, they being often Basted therewith, and the Green Leaves being bruised, being applied thereto.

XIII. The Simple Deconcentration in Wine. It has all the former Virtues, being given to half a Pint, and it may be given either alone, or mixt with an equal quantity of White Wine.

XIV. The Compound Deconcentration. It is made by selling the Herb with Common-Seed, Hyssop, Cref- ses, and Salt Water in White-Wine. It is good again- st the Stone in the Kidneys, and Bladders, as also against Sand, Gravel, and Tumours matter in those parts; kills Worms of all kinds in the Bow- els, and cures Tertian and Quartan Agues; Doth half a Pint as aforesaid; besides which, it has all the Virtues of the Juice abovementioned. If the Precipit is made of the Dying Turnfole Chars, it is said to be good against all Venemous Creatures, but chiefly against the Biting of the Spider Ploungum, as also the Stoning of Scorpios; the bruised Herb being also applied thereto.

XV. The Seed reduced into Powder. It may be given from a Scroope to two Scroopes more, in any convenient Vehicle at Night going to Bed. It kills Worms in the Stomach and other Bowels; and being taken also every Night constantly, and also 3 Hours before the coming of the First of Ter- tian and Quartan Agues, it is said to cure them.

XVI. The Catalogue of the Green Leaves. It is good against the Stoning of Wapins, Hornets, and Scorpios, the bitings of the Ploungum, Vi- per, and other Serpents, and prevals against the Gout in any part, or any place much pained; as also the Dralfe called Sprits, which is an Infla- mation of the Head, or parts about the Brain, in all these cases it gives eafe after a regular and ad- mirable manner, and being often and continually applied for some time, it perfectly cures them.

XVII. The Turnfole Chars. These are they which are Sold in our Drugglie Shops for Turnfole, being nothing else but old Rags dipped into the Juice of the full ripe Turnfole Berries, of the Fourth Species, that which is commonly called the Dying Turnfole. The Juice of these Berries (without doubt) is Cardial, and cheers all the Spirits Natural, Vital, and Animal, but no other use is made of it, or of these Turnfole Chars, but only to turn White Wines into Clares, or a Clare color, and to color Tarts, Sweet-Meats, Gellies, and other like things into a Glorious red color. But when one confiders, that these Turnfole Chars are old Rags, Shirts, Shirts, Smocks, Drawers, old nally Stockings, coming off from Poor, Many, Leprous, and Scabby Creatures, who have worn them several Weeks, yet Months, and sometimes still they have rooted off from those Webs, Distressed Creatures Backs, and that unwashed, so foul and fally as they are, they are diped into this Glorious and Precious Turnfole Juice, which is diped upon them, it would make not a Nice, but even an Ord- inary and Ruffick Stomach, loath to touch them, much more to abominize the Wine, Tarts, Gel- lies, Etc. which are colored with them; However I leave the matter to every ones Appetite, to dif- pense with it according to their several likenesses. As for my own part, I could never yet bring my Mind to the leal using thereof, for fear the touching of those Filthy Rags or Cloths, without a dermatization and abolition of them in the last degree: But as I find them, so I leave them, and re- mit their use to every ones Discretion, and to gra- tify the Stomachs and Appetites of those who make no scruple of such a kind of Nalishes.
Salmon’s Herbal. Lib. I.

Chap. 560. Atoing-going. The lift, which is that we treat of in this Chapter, is called in Greek us 
without, and in Latin Androfamum, or Androfamum 
from the Greek, and in English, Tuffan, or 
Park-Leaves; because it is so common or familiar in 
Groves, Woods, and Parks, that it grows almost no where else.

II. The Kinds. The most usual with us are, 1. Androfamum vulgar is: Androfamum Canesr or 
Delauney, Gueters, &c. Languenol: Androfamum 
Diploica, Galeri, &c. Plinius, Celsius, &c. Con-
tauria Theophrasti, tho’ in Androfamum denys 
it, and says it is the Cymenam Ilfavitam, Bedigul-
laris, and Coster Dacarmen also say, and that it is 
also called, Herba Siciliana, because they thought 
it grew naturally no where but in Sicily. Andro-
slamum maximum frateforem Bauhini, Androfamum 
maxis Caneror, Our common Tuffan or Park-
Leaves. 3. Androfamum Matthioli, Bachel, Lo-
caste, Cordi, Gfetari, Androfamum minus Can-
eror, 4, magnus Lobeli, & excellentiam ejusdem, 
(because he thought that the former or lift, 
was not worthy of the Name of Androfamum:) 
Pedanec will have it to be Rata Syleneis Diplo-
ica, and therefore calls it Rata Syleneis hyperi-
coleis, because Diplomaria says, that Rata Sy-
cofer was called Hyperico, by some in his time. 
Parkenson takes it to be Hyperico freeland Ira-
gi, and the Androfamum Campolerus of Columba, 
Androfamum alterum folis Hypericolei, quod 
digloraeus Hyperico, the Tuffan or Park-Leaves 
of Matthiolus, sofo Johnes-wort Tufsan. 5. Andro-
slamum alteram apulum Columbas, Androfamam per-
foleum & Sporafum Bauhini, the Tuffan of Naples.

The Descriptions.

III. The first, or our common Tufsan, or Park-
Leaves. Its Root is brownish, something great, 
hard and woody, spreading it self well in the 

Tusfan, or Park-Leaves.

Ground. It rises up with Stalks which are brown-
ish, sliming and round, 1 no square, like those of 
Alceum or Peters-Wort, ered all their whole 
length, rising to be two, and sometimes 3 feet high, 
and spreading out into Branches, even from the 
bottom, but more thinly set, each being further 
and farther, having divers Points, and at each of the 
two large Leaves, spreading but more thinly 
set than of the other sorts, of a dark brownish green 
color on the upper side, and of a yellower green 
derneath, turning reddish towards Autumn, but 
shining on the Branches all the Winter. At the 
tops of the Stalks and Branches, stand larger yel-
low flowers than in Hypericon or Alceum, and 
Heads or Berries with Seed, which is likewise lar-
gcr, which being green at first, and afterwards 
reddish, turn to be of a blackish purple color when 
they are through ripe, with small brownish Seed 
within them, and then yield a reddish Juice, of a 
reasonable good Smell, something Befomes, and of 
an harsh or Stypticke Toffe, as the Leaves and 
Flowers also be, the much left in that Qualification : 
Cereti says, that the Juice perfedto of the Leaves 
is like Claret-Wine, but Parkinson denies it to yield 
a Japer of such a high pure reddish.

IV. The second, or the Tufsan, or Park-Leaves of 
Matthiolus, or Johnes-wort Tufsan, unless you would 
call it Alceum magnus, Great Peters-Wort, because
Chap. 718. **English Herbs.**

Joan, tailor of branches, but otherwise very like to Hypericam or John Wort, but the branches are thinner set with leaves, much looser and greener than those of the former Tuttin, but greater than that of Hypericam. Hypericam perforations of holes at all in them. The flowers are yellow, and greater than they, and so are the Heads or Berries with Seed, but studded with black Streaks on them. The Leaves and Flowers both, doges a red Juice, like to that of Hypericam or John wort, by which it may be plainly known, as also distinguished from our common Tuttin before descirbed. The Sticles dye and perish upon the coming on of Winter.

V. The third, or Tuttin of Naples. Its Root is purple and reddish, which lends forth reddish or brownish Stalks, no much above a foot high, with two crafted Stalkas like Fins all their whole length, it is full of branches, and more bushy than the last, but grows not so tall as it, having two Leaves growing at every Joint, closely jointed thereon to the bottom, that the final Stalks or Branches, seem to run through them, yet are thinner than the last described of Matthiordus, are sharp pointed, of a dusky green color, and finish on the upper side, but white underneath, and hanging many small holes therein, so small as scarcely to be perceived, and for the most part are greater and broader towards the tops, than they are below. The Flowers at the tops of the Branches, are of a purer yellow color, and many more set together than in the others, whose green Heads whereon they stand, have blackish Spots on them, which so oblige when the Heads are full of Seed. Both Leaves and Flowers yield a reddish or bloody Juice (as the others do) being bruised between your Fingers.

VI. The Places. The last grows in many Groves, Woods, boshells, Parks, and Woody-places, and by Hedge-side in many parts of England; as by Rusty in Essex, the Woods of Kent, Hampstead-Wood, and many other places. The second is found growing about Brizzle and Bath, and several other parts of the West-Country. The third is a Native of the Kingdom of Naples, but with us is only found upon Gardens.

VII. The Times. They all Flower later than Hypericam or Ageratum; They all Flower in July or August, the Seed or Berries, in the mean time growing upon them. The first become red in Autumna, at which time their red Wine Juice may be profitably

VIII. The Qualities. Taffin is hot and dry in the first Degree, Adstringent, Althening, Vulcury, and Carbamick.

IX. The Specification. It seems to have all the Virtues of Hypericam and Ageratum. John and Fever-Wort, is good against the Gout and Scirrhus, heals Burnsings by Fire, stops the Bleeding of Wounds, heals Speedily all Simple Wounds, also Ulcers and Eruptions.

X. The Preparations. You may have therefrom, 1. A Liquid Juice or Essence from the Leaves, Flowers and Berries. 2. An Infusion of the same in Water or Wine, done as Tea is made, and to be drank in the same manner. 3. A Powder of the Seed. 4. A Wine Drink. 5. A Balfam or Oil. 6. A Castigation of the fresh Herb.

The Virtues.

XI. The Liquid Juice or Essence. Two or three Spoonsfull of it given in Barbaram, or other Styptick red Wine, stops all sorts of inward Bleeding in the Viscera, whether proceeding from inward Wounds, or opening of the Mouths of the Veins, or any other cause whatsoever, as Spitting and Vomiting of Blood, the Bloody-Flux, Filting of Blood, and the Overthrowing of the Terms in Women, or of the Leeches in Child Bed. It has many other proper and particular uses, and is profitable against Agues and Fevers, and stops all sorts of fluxes of the Bowels; and is of excellent use in curing a Gonorrhoea, universally beingmented.

XII. The Infusion in Water, etc. It is made as Tea, and drunk with a little double refined Sugar, in the same manner. It has all the former Virtues, (but weaker) and graces the Scornish, and all Scotchmen, and all the other Bowels; besides which, it is of good use in stopping Cataracts.

XIII. The Powder of the Seed. It is very Althening, and pureges Choleric and Humors as Thymolites says: And being taken to two Drums in Hony and Water, Mead, or New White-Port Wine, it is a Singular Remedy against the Scirrhus and Gout, and other like Rheumatick pains; being also applied to green Wounds, it presently stops their Bleeding.

XIV. The Wine Drink. Take of the Infusion of the Leaves, Flowers and Berries, some of them, or all of them, in Wine, or in half Water half Wine, a quart: Of the Liquid Juice or Essence, a Pint; of Spirit of Wine a Quart, Honey, enough to give a pleasant Sweetness, mix and disperse it. It is a good Wound Drink, being taken inwardly, (to half a Pint at a time) Morning, Noon, and Night. Outwardly used also as a Lotion, it cleanses Wounds, Ulcers and Eriedals, and induces their Speedy Healing.

XV. The Balsam or Oil. The Oil is made exactly as Oil of Hypericam, in Chap. 459. Sect. 11.

The Balsam, as that at Sect. 616, of the same Chapter. Of thus: Take of the Simple Oil two Pounds, Balsam of Peru a Pound; Ohio Turpentine half a Pound; melch, and mix all very well together, and then add Chymical Oil of Oranges six Ounces: mix them, and continue to stir them till nearly cold. It has all the Virtues of the Simple and Compound Oils, and is excellent for any Pain or Grief proceeding from cold and moisture, Over-turning of the Joints, Weakness of any other parts, Constipations, Burnsings, Constrictures of the Muscles, Nerves and Tendons, or any good Pain, Hurt, or Ulcer, whether inward or outward, few other Medicaments being superior to it. Dose inwardly from a Dram to two Drums, drinking a Glass of Styptick red Wine after it.

XVI. The Castigation of the fresh Leaves. It cures Burnsings and Scaldings, and applied upon fresh made Wounds, it stops their Bleeding, and especially if the Pouder of the dried Herb or Seed be first plentifully sifted upon them, and then it quickly heals them. Gerard says, that being laid upon broken Skins, and Scabby Leers, it cleanses them, as also many other Grievs of like kind.

TWA-BLADE, see Bifoil, Chap. 67. TWO PENNY-GRASS, see Money- Wort, (Chap. 496.)
Valerian Garden, Great.

which flowers, which are sometimes dye'd over
at the edges with a pale purplish color, having
but a weak smell; they being past away, there
follow small brownish white Seed, which is easily
carried away with the Wind. Consequently, there
is a Mountain kind of this Species, found in Savoy,
which is more serviceable than this, smelling not much
different to a full ripe Citron, and is more efficacy
in the producing than that is.

Valerian Garden, Small.

The Descriptions.

III. The stalk, or our Great Garden Valerian, or
Setwall. It has a Root about an inch thick, firm
and greyish, lying for the most part above Ground,
(of which particular, our figure here is defective)
being forth a Shirt under the upper part of the
Leaf, and flowering forth on all sides small
pieces of Roots, which have all of them many long,
and great Sedges and Fibers under them, by which
it is joined to the Earth, and by which it draws its
Nourishment. The Root is of a pleasant flavor.
Smell when it is broken, and smells sweeter and
more strong than either Leaf or Flower, and is
more use in Medicine. From the Heads of these
Roots, rising up many green Leaves, which at first
are something broad and long, without any division
at all in them, or denting on the edges: But they that
rise up afterwards, are more and more divided on
each side, some to the middle side, being in a
manner Winged, or if many Leaves were growing toge-
ther on a middle part, and those growing also in
the Stalk itself, are more divided, but further
towards the top than those which grow below.
The Stalk is about a Yard high or more,
sometimes Branch'd at the top, repeat with small
Chap. 710. English Herbs.

VI. The second, or lesser Garden Valerian. The Roots of this are long and small, and very full of Fibres or white Threads, smelling like to the smalt Wild Valerian. It is in its Growth and Leaves very like unto the last, but much smaller, bearing its Leaves divided much in the same manner; the innermost at bottom of the Stalk being without any division at all in them. The Stalks are not above half the height of the other, bearing small Tufts of white, purplish Fibers.

V. The third, or red Valerian. Its Roots are great, thick, and white, continuing long, and flooting out new Branches every Year. It has several hard, whitish, bristle green Stalks, full of Tuberous or Smelling Roots, at which stand two Leaves one on each side, and now and then some small Leaves from between them, which are somewhat long and narrow, breadth in the middle, small at the inner end, and sharp pointed, of a pale green color, and without any Division or Root on the edges. The Stalks are 3 or 4 feet high, branched at their tops, at the ends of which, come forth many Flowers together, something like to the Flowers of the first, or our great Garden Valerian, but with shorter Necks, of a fine red color, without any of the Valerian Smell. After the Flowers have been blown a good while, they suddenly fall away, and the Seed which is small and naked, with a little Tuft of Down at the top thereof, (whereby it is easily carried away with the Wind,) ripens quickly after.

VI. The fourth, or Greek Valerian. Its Roots consist of a number of small, long, blackish Fibres or Threads, without any of the Valerian Scent. It has many Winged Leaves lying on the Ground, something like to the Wild Valerian, which grows by Ditch fides, but more tender and small; from among which, rise up two or three small, slender, light green Stalks, stout and three Feet high, on which are set at the Joints, such like Leaves as grow below, but smaller: The tops of the Stalks are divided in-

Valerian Greek.

Valerian Rock:

OR,

Annual Small Setwall.

higher Leaves are deeply notched or dented on both edges. The Flowers are small, of a whitish purple color, consisting of five small round pointed Leaves, upon round rough Heads, which when the Flowers are fallen, become Star fashion'd, divided into five parts.

VII. The fifth, or Tuberous Valerian of Candy. The Root in its upper part is roundish, roots and Tuberous, from whence foot forth round about its small long Strings, each of which having at its end, a small length round Tuberous Root, softly to the same, not much unlike to the manner of Filipendula Roots, whose Smell is very much like to that of our first great Garden Valerian, before described. The first Leaves which Spring up from the uppermost great Tubers, lie upon the Ground round about the same, and are green, thick and round, like to the Leaves of Althaeus, and sometimes greater. The next which come after these are longer, and much divided or cut in on the edges, and single, which yet follow, are more and more divided, so that those which grow upon the Stalks, are very like
Salmon's Herbal

XIV. The Preparations. You may make the following.

1. A Liquid Juice or Essence. They warm and comfort the Stomach and Bowels, provoke Urine, and are profitable against the Strangury; are good against Pestilential Pains, and pains of the Repechings, relish Poison, and provoke the Terms in Women.

Dose 2, 4, or 6 Spoonfuls, taken Morning and Night in a Glass of Genuine Wine: it kills Worms in the Stomach and Belly.

XV. A Syrup Decoction is good in fevers, which make urineth plentifully, helps Obliterations of the Stomach and Lungs; is good against the Stingings or Bittings of Poisonous or Venous Creatures, as also the Inflammation of any Pestilential Disease, yes, and the Plague itself.

Matthews says, that the Decoction of the Root of the Leper Venereum, is more potent in relishing Poisons, or Infections of the Lungs, than the greater. In cases of Plague and Infection, it is made in Wine. This is generally called in England, the Poor Man's Remedy, after taking a Great Cord to drink it, and Sweating after it, as also to dispel Wind, and ease the Cholic: drop into the Eyes, it clears the Eye-light.

XVI. The Decoction Compound. Take Roots of Valerian & Oatens, Raisons boiled & Oatens, Liquorice bruised or scooped, 2 Oatens, Anisoids bruised one Ounce, Wine two Quarts; but till a Pint is confounded, strain out and keep it for use, it is good against Affama, Coughs, Cold, Difficulty of Breathing, Hoarseness, Wheezings, and other Difficulties of the Lungs, opening the Pus, and curing an Expiration of the Mollusk matter.

XVII. The Powder of the Root. Galen says, that it is like to Nardus, or Spiceward in quality, and for all the time purges, but much weaker, yet it provokes Urine more plentifully than either the Indian or Syrian Nardus, and then is like unto the Celib Nardus. Plenty says, that the Powder given in Drink, or in the Form of a Simple Decoction in Wine, does help all Obliterations of the Stomach and Lungs, or of any other part, as also pains of the Psoas, Hypochondrons and the like, and it is given in the Colic and Stone, or Strangury, or Obliterations of the Terms; against the Plague, and all sorts of Pestilential Fevers, the Pox, and the Stingings or Bittings of Venous Creatures; and has all the Virtues of the Juice, Essence, and Simple Decoction aforegoing. Dose to one Dram in Wine, or some proper Vehicle.

XVIII. The Balsam. As it is good to cure Wounds, as also old Ulcers, the Seeds being first washed either in the aforenamed Simple Decoction, or the Spirituous Tincture following. It also cures Filthick, it Pouders of Valerian Leaves be mixed with it.

XX. The Cataplasma. It is made of the Green Herb with the Root, by beating in a Mortar. Being applied to the Head, it eases the Head- ache, and the movement Shutting therein,9 Hops Cataracts, and Rheums, or thin Diarrhoea of Humors. It is good to heal Cuts, Wounds or Sores, as also simple Compu-
Chap. 720. English Herbs.

Valeriana, while the two kills greater of the greater Valerian in May. It has all the virtues of the Juice, Essence, and Simple Decoction. Mixt with the Juice of Heliotrope, and so taken, it is more effectual, and is a preservative against the Pesteilence or Plague when that Disease reigns, so also taken, it kills Worms in the Belly, and the same mixture drop into the Eyes, it takes away the dimness of Sight, or any Fever, Hot, Cold, or Film therein. And if therewith green Wounds or old Ulcers be wafht, it induces their speedy healing.

XXI. The Distilled Water from Herb and Root, of the greater Valerian in May. It has all the virtues of the Juice, Essence, and Simple Decoction. Mixt with the Juice of Heliotrope, and so taken, it is more effectual, and is a preservative against the Pestilence or Plague when that Disease reigns, so also taken, it kills Worms in the Belly, and the same mixture drop into the Eyes, it takes away the dimness of Sight, or any Fever, Hot, Cold, or Film therein. And if therewith green Wounds or old Ulcers be wafht, it induces their speedy healing.

XXII. The Spirituous Tincture. It strengthens and fortifies the Stomach, and prevails against the Colic, Palpitation of the Heart, Fainting Fits, Sicknels at Stomach, and the like. Dose half a Spoonful to one Spoonful, in a Glass of Wine.

XXIII. The Aqueous Tincture. It is a Specific against the Plague or Pestilence, and all other malignant Fevers and Diseases; strengthens and fortifies the Stomach, causes a good Appetite and Digestion, and relieves Purges. Dose 3-4 drops or more, in a Glass of Wine, or Vine and Water.

The Descriptions.

I. The first, or greater Wild Valerian. Its Roots are slender, with a Bunch of whitish Threads or Strings, which send forth other Threads of increase; besides which, the inner branches do flow forth Vivid Roots also. It reflex with a Stalk and several Winged Leaves, of which, the end Leaf is the largest, of a Jet green color, with few or almost no Dents on the edges, the Stalk but two such like winged Leaves at every Joint, as green below, but smaller, and at the top branched into Heads or Umbels of small white or Purple Flowers, but deeper than those of the first, or Great Garden Valerian.

IV. The second, or Leafe Wild Valerian. Its Roots are slender, growing a-few, creeping, and full of fine small Threads, having but little Smell. It much resembles the former in its Stalk, winged Leaves, Flowers, and manner and form of growing, but far less. Reflexe, the first Leaves there-

Valerian Wild, Small.

of are singed, whole and undivided, whilst the others which come forth after upon the Stalks, are winged, and exactly like the former, yet much less. The Stalks are not much above a Foot high, on whole tops grow fawny cumbles of Flowers, like the first, of a light whitish purple color.

V. The Places. They both grow in Marshes and wet Meadows, by Rivers and Waters sides, Watery Ditches and Ponds. In many parts of England, but the greater kind for its usefulness, is now brought into Gardens, and well up there, where it flourishes very well, whilst the Leafe will scarcely
Salmon's Herbal. Lib. 1.

The Juice of the Wild Valerian is held by later Herballists, to be good for such as are troubled with Ruptures, or broken Bellies; and such as are afflicted with Cramps and Convulsions, and to cure simple Convulsions occasioned by Falls, Bruises and the like. Dose 3 or 4 Ounces, Morning and Evening, in a Glass of Wine.

Note 1. The Fowler of the Roots of either the greater or lesser kinds. It is given to a Draught at a time in any convenient Vehicle, especially in White Port Wine, it is said to cleanse the Stomach and Bowels of Stints, Acrimonious, and Filthy Humors, by Purging them away both upwards and downwards.

VENUS-BASON, see Teatle, Chap. 686. VENUS-HAIR, see Maiden-Hair, Chap. 489. VENUS-COMB, see Shepherds Needle, Chap. 650. VENUS-LOOKING-Glass, see Corn-Violet, (Chap. 780.)

CHAP. DCCXI.

Of VERVAIN.

I. The Names. It is called in Greek, γενομον, i. e. Ώκεβα Ψεκτρώ, and Verbena, Verbena vulgaris, Verbena officinalis, Verbena recta, Common Male, or upright Vervain. 2. Verbena perverse, Verbena Fimbria, Verbena violeta, Foreign, Female, or bending down Vervain; and this last all Authors call the Female kind. 3. Verbena Persana, Verbena Americana, Verbena Cornelianon, (which I so call, because I found it thrice in some parts of the South Carolina) American, or Peruvian Vervain.

The Descriptions.

III. The first, or our Common Male, or upright Vervain. Its Root is small, long and springy, and of little or no use. It has divers somewhat long and broad Leaves next the Ground, deeply girt towards their bases, the other parts being deeply dent'd about the edges, and some of them only deeply dented, or cut all alike, of a blackish green color, on the underfile, and greyish underneath. The Stalk is square, and spread out into divers Branches, rising up about 2 Foot high, (especially

if you account thereunto, the long Spikes of Flowers at the tops,) which are set on all sides thereof, one above another, and sometimes two or three together, being small and gaping, of a purplish blue color, with white internuts; after which, come small round Seed, in small and somewhat long Heads.

IV. The second, or Foreign Female, or bending down Vervain. The Root is altogether like the former, perishing after Seed time: it has divers smaller and weaker square Stalks, leaning or bending down towards the Ground, and some of them almost lying thence, not bending so upright as the former, spread out into many more smaller Branches; and having such like Leaves growing on them at the several Joints, but much smaller, and more divided or cut in, making them seem to be so many Leaves set on both sides the middle Rib, of a greyish green above, and more grey underneath. The flowers grow in the same manner as the others, in small long Spikes, being of a deeper blue color than the other, otherwise in form not unlike. The Seed which follows is like it also, and of its own accord, ripes itself of its own Sowing.

V. The third, or American, or Peruvian Vervain. This in its Roots, Stalks, Leaves, Flowers, and manner of growing, is much like unto the last, but grows greater, and abounds green in winter, as well as summer, in its own Native Place of Growth; but with us, it will not abide our cold Winters, but perishes by the Unnatural heats and Froidness of our Climate.

VI. The Places. The first grows Wild generally throughout all England, by Hedges and High ways, in Borders of Fields and other waste Grounds. The second is no wild Plant with us, but is Nud & up in Gardens. The third is Native of America, as in Persia and Carolina, in the South of which, I found it in three several parts.

VII. The
VII. The Timur. The fifth Flowers about July, and the Seed is ripe in some small time after: The second will not endure a Winters Blast before it Seeds with us; and therefore seldom flowering before Winter, it scarcely brings its Seed to perfection here. The third Flowers in America in July and August.

VIII. The Cudlew. Vervain is hot in the first degree, and dry in the second. Materia Medica, alter the Horehound, Ancylo, Drurick, and Valleracy, Pulmonick, Nephrick, Anthricick, and Alexipharmick.

IX. The Specification. It is good against Althemia, Coughs, Cold, Wheezings, Heartaches, Biting, and Stingings of Serpents, mad Dogs, Hornets, Scorpions, and other Venomous Creatures: It prevails against the yellow Jaundice, Dropfy, Gout, Strangury, Obstructions of the Stomach and Bladder, the Colick, and all other inward Pains and Torment of the Bowels. It kills Worms in Stomach and Belly, prevails against Tetter and Quars Agues, all sorts of mall Dilies, and the Plague or Pelli
tence it self. It stops Breeding whether inward or outward, confolates and heals Green Wounds as all Old Ulcers and Fistula’s, whether in the Mother, Child, Teeths, Nails, Legs, or other parts of the Body. It abates inflammations, takes away Deformities of the Skin, cleanses and clears the Eye-light.

X. The Preparations. You may make thereof.
1. A Liquid Juice. 2. An Essence. 3. A De
guid Juice of the American.

The Virtues.

XI. The Liquid Juice. It is drying, bitter and binding, an opener of Obstructions, cleansing and healing: It cures the yellow Jaundice, Dropfy and Gout, opens Obstructions of the Lungs, Liver, Spleen, Neves, Kidneys and Bladder, gives ease in the Cick, and all inward Pains and Torments whatsoever. It is good against the Biting and Stings of Vipers, and other Serpents, mad Dogs, Horse, Scorpions, Tarantulas, and other Venomous Creatures: It prevails against the Plague or Pellience, and all other sorts of Dilies, cures Tumours, and all sorts of Quars Agues, and kills and expels Worms out of the Stomach and Belly, causes a good color in the Face, is effectual against the Dilies of the Stomach and Lungs, as Painting, Sweating, Leaching, ware of Appetite, Indigesti
coughs, Colds, Althema’s, Wheezings, Rheums of Breath, difficulty of Breathing, and other like Dilies of the like Parts. Dose 2 Ountes, more or less, Morning and Night, in White Port or Lisbon Wine, or Hony Water.

XII. The Essence. It has all the former Virtues, and more especially to all the same purpozes and inventions; both which, it is good against the Dropfy, as also against the Stone, Gravel, Sand and Tartarus Muscles in the Reins and Bladder, cleanseth them of all sorts of vicious matter which may stick in the Parts. It confolates and heals all simple green Wounds and Ulcers, Fistula’s, and other like Sores in the Mouth, Throat, Scerets, Legs, and other parts, they being without there

The Virtues.

XII. The Essence. It has all the former Virtues, and more especially to all the same purposes and inventions; both which, it is good against the Dropfy, as also against the Stone, Gravel, Sand and Tartarus Muscles in the Reins and Bladder, cleanseth them of all sorts of vicious matter which may stick in the Parts. It confolates and heals all simple green Wounds and Ulcers, Fistula’s, and other like Sores in the Mouth, Throat, Scerets, Legs, and other parts, they being without there
this very thing being given to many others, who complained in like manner, they were all brought before, by voicing their Worms more or less, and some by voiding Routs or Balls of Hair, and other Heterogenous things. It is held to be no less effectual against all manner of Poison, as also the Bittings of Serpents, and other Venomous Creatures. Many other great things Monardus speaks hereby, which such as plique, may have recourse to the Author for the same.

CHAP. DCCXII.

Of Vetches not bitter.

I.

THE Name. The Vetch is called in Greek "πηκτών," "πηκτεῖον," "πηκτέον," in English, the Vetch or Tare. By we make a distinction, for all the Species are called Vetches, yet the Manured kinds are called Vetches, and of these, both the Manured and Wild sorts of them, we have here treated in Chap. 682. and 689. altogiving the others kind commonly called Vetcher, relate to be treated of in this, and the following Chapters.

II. The Kinds. Of these sorts of Vetches, we make two principal Species, viz. 1. The Vetches not bitter, of which we treat in this present place.

The Bitter Vetches, of which we shall discourse in the Chapter next ensuing.

Vetch Milk Baflard.

and Branches, many set together, which are small and short, of a dead purplish color, turning Wan with Rambing, and change into small, black, and almoll round pointed Cod, in which are contained 4 or 5 small blackish Grains or Puffe.

VI. The third, or the true great Hatcher Vetch, or Sickle-wort. Its Root is tender, purifying every Year. It grows not above a Foot high, with slender winged Leaves growing on its Stalk, which are so weak, as not to stand upright. Each of the Leaves is small, not very long, and round at the end. At the top are many small yellow flowers. (Matthioli says reddish, in which he was mistaken:) After which, come as many long, flat, thin, reddish, small crooked pointed Cod, containing flat and reddish Grains; so being in them, that they may be discerned from the Cod, the whole Cod being compos'd in Form to a Hatcher.

VII. The fourth, or Iffer Hatcher Vetch. Its Root is like the former, and perishes Tearly with us. In form and manner of growing, it is much like to the former, but something lefier, yet not much lower, if it grows in any good Ground. The Flowers grow many together, of a pale yellow color, and after them come small crooked Cod, bended almost together, or much like to a Horse-Shoe, in which are pale brown Grains, not fully round, but figure and lefier.

Vetch Hatcher Greater. or, Sickle-Wort Greater.

VIII. The fifth, or greater Horse-Shoe Vetch. Its Root is tender, 3 or 4 inches long, with several Fibres or Strings adjoining, white and hard, and lives many Years. It has divers small winged Leaves, set on small wood Stalks, leaning, or rather lying upon the Ground, each Leaf being small, flat, a little length, almost round pointed, of a whitish green color. At the joints with the Leaves, come forth long Flowers, viz. one at a place, on a very short footstalk, being small and yellow, after which, follow a long flat Cod, a little bowed, and cut or divided on the Concave or inner edge, into 2, 3, or 6 divisions, each being cut in round, something like the Letter C. or like an Horse-Shoe, whence it took its Name; in which he so many Grains, as there are spaces between the Ovals or Cats, which are small, length and crooked.

IX. The sixth, or Iffer Horse-Shooe Vetch. This in its Roots, Stalks, Branches, Leaves, Flowers, Cod, and manner of growing, is very like to the former or greater kind, but lefier by the half, the Stalks being not about three or four inches long, and lying close upon the Ground, and in of a little whiter color than it.

X. The seventh, or greater Bird's-Foot Vetch. It has a long, tender, stringy Root, running deep into the Earth. It is a small Vetch, (tho' greater than the last) not growing above a Span, or 6 or 9 Inches high, with many Branches spread on the Ground, set with many Wings of small Leaves, in manner of the last Vetches, but much smaller. The Flowers grow upon the Branches, many small ones set in a Leaf or Head together, of a pale yellow color, which afterwards turn into so many small pointed Cod, well refeshing the Claws of a small Bird, (whence...
the Name, in which are contained many small round Grains.

XI. The third, or leaff Birds Foot Vetch. This in its Roots, Stalks, Leaves, Flowers, Cod, and manner of growing, is like the former, but leaff in all its parts, and growing with its Branches and Leaves in a more bafmond manner, in which it is all the difference.

XII. The ninth, or Knotted Birds Foot Vetch. This has in its Roots many small white Nodules or kernels, among its Fibers, otherwise in its Stalks, Winged Leaves, Flowers, Cod, and manner of growing, it is like to the greater Birds Foot, seeming that the Flowers are of a pale yellow red color, the Cod is divided by Faints, and the whole Plant something larger.

XIII. The tenth, or our common Kidney Vetch. Its Root is long, blueish on the outside, white within, parted many times into 2 or 4 or more long parts, with some Fibers adhering to them. It is a small Plant, scarcely growing to be a Foot high, bearing many Winged Leaves coming from the Root, which are something small, long, soft, softy, pointed, given on the upperside, and mostly underneath, not always fat orderly one against another, but confusionly, the greatest and longest being at the end.

Vetch Kidney, Common

which some wantonly have compared to Lentil-Leaves, but bigger; among the Leaves rise up Joh Stalks, divided into Branches, with the like Winged Leaves on them. At their tops grow Tails of many small yellowish fivest Flowers, sometimes of a white, or pale purple, not much whiter, as Cornflowers, even to the Tails of the Meadow-Trefoil, standing in white hairy Heads. After the Flowers are past, there come in those Heads or Pots, small, round, flatish Grains, very like to those of the Meadow-Trefoil, but a little redder, and usuably but one in a Cod.

XIV. The eleventh, or Star Codded Vetch. Its Root is small, fliender, and yellowish, running deep into the Ground. It grows to be about 6 Inches, or it may be 8 to 10 Inches high, with upright Stalks, on which are set many Winged Leaves, containing of many very small Leaves, like unto those of the Birds Foot. From the joints of the Stalks with the Leaves, come two Tails of small pale yellow Flowers, upon a small prickly fiddle Footstalk, which turn into 6 or 6 small, long, crooked pointed Cod, standing one against another, like unto a Star, from whence came the Name, but not jointed as the Birds-foot are, having within them small brownish Seed, of the Tails of other Pufets, but a little clumsy withal.

XV. The twelfth, or Liquorice like Vetch. Its Root is thick and long, dividing it self into two or three very long Strings, running very deep into the Ground, as deep even as Liquorice Root) srotts in Tails like to Liquorice, which dies out, but abides long, forming four new Branches every Year in the Spring. From whence rise up many weak, round, hard Stalks, standing on the Ground, branched upwards, for something thick with Winged Leaves, made of many leafy ones, set by couples upon a middle Rib, much like to those of the great Wild Tare, in Chap. 63. Soft. &c. growing, and one lower, and pointed also at the end. The Flowers come forth at the joints, many together, standing upon a long Footstalk, of a black white color, tending to yellow, which turn into crooked Cod, containing two rows of Grains, cornered, greyness, and of the Tails of other Pufets.

XVI. The thirteenth, or another Liquorice like Vetch. Its Root is like the former, thick, and every year spreading, and running deep into the Ground, and srotts in Tails as the former, abiding many Years, and according to Thallus, is very like to the True Liquorice. It has much like Stalks and Winged Leaves as the Jst, but not spreading so far, nor leaning so much down, nor are the Winged Leaves so large, but of a darker green, on the upperside, and gray underneath. The Flowers are of a Purplish color. The Cod are brownish, long, and round, and the Grains within them more round than the former.

XVII. The Places. The first grows in divers Corn-Fields in Kent, as about Dartford, where Gerard says he had found it. The second is to be found in Gardens with us. The third and fourth grow also in our Gardens. The fifth and sixth are Natural to the British Climates, being often found upon dry Heaths, as beyond Dorset and Somerset in Kent, and several other places. The seventh, eighth and ninth, grow also with us on Heaths, and open Unfitted places, in many parts of England. The tenth and eleventh, as also the fourteenth, are found likewise in many places of this Land: Gerard says, he found them all three growing upon Hampsfleed-Heath, near London, right against the Bray, going from London, near to a said Prit, and that they grow upon Black-Heath, in the Highway leading from Greenwich to Chocenden, within half a Mile of the Town. The twelfth Gerard says, he found growing in Great Saffris, in the Kings much withal, as you go from Saffris, to Berney Church, about six Places from the end of the Town, and in many other places of the same Country; and in Effes, about Wannoon, and in the Towns called Clare and
The Virtues.

XXII. The Purselled Puffe of the yellow Wild Vetch. So eaten it is Attrigent and stops Fluxes of the Belly, but is harder of Digestion than Lentils.

XXIII. The Palatge of the same. It is made by boiling of them in Water, till their Grains are broken, after the manner of Lentils. So eaten, it stops Fluxes both of Stomach and Bowels. It is useful, it is binding as the Lentil, and is used to be eaten as Lentils, but dries more powerfully, and heals moderately, which Affringtgent quality doth new in this place.

XXIV. The Decolation of the Root of the Milk Vetch in Wine. It is Affringtgent, and Galeys says, it stops Fluxes, and provokes Urine, and is profitably used against the fouetness of the Gums, (that is the Scurry in the Mouth) as Plynys says.

XXV. The Vender of the Root of the same. Stewed upon running Sores or Ulcers, or cut into them, it dries them up and heals them. It is good also to stop the Bleeding of Wounds.

XXVI. The Vender or Meat of the Pule of the same. Being dried in an Oven, and cut into Wounds and Ulcers, it drys and heals them.

XXVII. The Vender or Meat of the Pule of the Birds Foot Vetch, or Horse-Shoe Vetch. It is Stomatik, strengthens the Viscera, expels Poifons, and opens Obstrudies of the Bowels; and is good against the Bitings and Stingings of Venomous Creatures, as Mathioloys says, and being taken with Honey as a Bois, it crueth the expectation of tough and thin Flegm, kills Womans and healeth upon Ulcers it cleanseth them, and make into an Ointment with Honey, it heals Ulcers, and takes away Freckles, and other Deformities of the Skin. Doth inwardly, one Dram, Morning and Evening, in Wine, Honey, &c.

XXVIII. The Decolation of the same in Wine, as also of the Stalks and Leaves of the green Herbs. It has all the Virtues of the former Pouter, besides which, it opens Obstrudies of the Stomach, Liver, Spleen, Mesenteries, Reins, and other Bowels; strengthens the Stomach, expels Poifon, kills Woman in the Belly, and is used as a Wound drink.

XXIX. The Decolation of the Pule and Herb of the Birds Foot Vetch. It is a little drying and binding, and is used in Wound Drinks, and being a good Vacularly, is used outwardly for the same purpose. And Langdolfe says, that the Knotted Birds Foot is Found by experience, to break the Stone in the Stones and expel it, and that it wonderfully helps Ruptures inwardly taken, and outwardly applied.

XXX. The Decolation of the Pule and Herb of the Kidney Vetch. It is used as a Wound Drink, to induce the healing of Wounds, and also outwardly to wash them therewith for the same purpose.
XXXI. The Juice of the same Herb. It is useful (mixed with a little Wine) in the same manner as the Decoction, and, for the same purpuses, in curing Wounds, Ulcers, running Sores, and the Gout.

XXXII. The Cataplasm of the same. Mixt with Powder of Tobacco, it is good to cleanse and heal old running Sores and Ulcers; and applied to the Joints afflicted with the Gout, it eases the pain.

XXXIII. The Decoction of the Root of the Liquorice Pervivc i,Wine. It is good against Asthmas, Coughs, Colds, Cataracts, Disordered, Obstructions of the Stomach and Lungs, and other like Difficulties of those parts; and has all the Virtues of the true Liquorice, but not altogether so powerful, but opens all Obstructions of the Bowels, and cures the Colick.

XXXIV. The Powder of the same. It has all the Virtues of the former Decoction, and being made into an Electuary with Honey, powerfuly opens Obstructions of the Lungs, and cures all Difficulties of that Part, and outwardly applied, heals Wounds and Ulcers.

XXXV. The volatile Salt, made from the Pulpex of all the Vetches. It is made as that of Bees, in Chap. 55. Self. 16. foregoing, and has all the same Virtues, being good against Palpex, Cramps, Convulsions, Appendices, Epilepsies, Gouts, Rheumatism, Cols, and other Difficulties of the Head, Brain, Nerves, Viscera and Womb. Dose from 6 Grains to 1/2, in any proper Vehicle.

By an Over sight, these two following Cures being left out in their proper places, we thought good to add them here, rather than they should be left.

Great Wild Hedge Tare; or,

Bitter VETCH.

Belonging to CHAP. 683. SECT. 8.

CHAP. DCXXXII.

Of VETCH Bitter: or,

OROBUS.

1. The Names. It is called in Arabick, Herbam, vel Herba, also Kesfente, or Kesfene; in Greek, υβρατς, υβρατον; in Hebrews, בּרִבָּת, or בּרִבָּת, and in Latin, herba, & Orobus; and in English, Orobis also, and Bitter Vetch.

2. The Kinds. There are first, Orobis Hortensis, Garden Orobis, which is 1. Orobis vulgaris, Ervasum Matthioli, Medeas, Orobis receptus; Hortisorum; Our common Garden Orobis, or bitter Vetch; 2. Orobis Creaticus, Matthioli; Orobis or bitter Vetch of Candy. Secondly, Orobis Sylvestris, Wild Orobis, viz. 3. Ervasum Sylvestre Dodeaei, Ervasum Sylvestre Herboriourum Labiis, and Catarrhose Grefrics, Lugdunensis & Damasceni, in his French Herbal; also Lathyrus Sylvestris minor Binamum, tho' it has no Clapers at all, as all his
Chap. 723. English Herbs.

his other Lathyr's have, whereby he breaks his own order of treating of their Plans, in which he determined to treat of all such Pulses as had Cliffs together, whereas this has none; and such as had none, by themselves; Crimson Flower'd Orobus, or Grains Leaf'd Orobus. 4. Orobus Sylvestris, Northenly; Orobus Excurrentis, by Orobus Semine, oblonga Triangula Balsini, Cler Orobus and Thes- phrastii Lobeli, Corned or French Orobus. Third-

IV. The second, or Orobus, or bitter Vetch of Candy. This is its Root, Stalks, Branches, Winged Leaves, Flowers and Grain, as also in its man-

V. The third, or Crimson Flower'd Orobus, or Grains Leaf'd bitter Vetch. Its Root is long and slender, with some Fibres adhering to it, which perishes with us in Winter. This Wild Orobus or Puffe, ripes up with several Branches, near two Feet high, especially if it grows in any Kervil Soil,

The Descriptions.

III. The first, or our common Garden Orobus, or Bitter Vetch. Its Root is small, and perishes every Year. It is a small Puffe, shooting forth divers weak slender Branches, leaning to the Earth, and scarcely rising above a foot high, before on all sides with many winged Leaves, each of which small ones are very small, and set on a middle Rib, a little

Vetch Bitter, Common.

Orobus Verus.

which are beset anewly, with many long and nar-
round long Gods, no bigger than the Tag of a Point, branched out on 3 or 4 parts, in which the Grain is contained, which is almost half round, small, and of a pale color, and bitter in Taste.

long, narrow, and sharp pointed, set one against an-
other as other Vetches, Sicer, etc. The Flowers are small and whitish, (the same may say Pur-

Vetch GrasScarlet.

At the top of the Stalks and Branches, from pre-

the Joints with the Leaves. After which, some small

long, and almost round Gods, containing within them several hard blackish Grains.

VI. The fourth, or corned, or French Orobus. Its Root is long, slender, and fibrous, which sends up a weak or leaning hallow Stalk, half a Yard high, set at the Joints with many Winged Leaves, having other small Leaves, long, narrow, and sharp pointed,
Salmon's Herbal. Lib. I.

set opposite to each other, on a middle Rib, after the manner of those of Lemnula: as the joints towards the top, come forth long Footstalks, with many Footers on them, set close together, which afterwards give long, round, bunched out Cods, slender in between each Grain, which is twice as large as those of the first Orobus, not so round, but a little curved, of a pale or yellowish color, differing little from them but in their so much rounder, and dark appearance.

VII. The fifth, or broad Leaf'd greater, or purple Wood Orobus. Its Root is long, black, and hard, bunching forth in some places, with four fork'd long Strings and Fibres attached to it, and endures many Years. It grows not much above a foot high, having many figure Stalks, helped along. The Leaves are Viscous, the smaller leaves set yet by another on each side of the middle Rib, six, eight, or ten in number, very much larger than any of the other Orobus's, being 2 or 3 inches long, and on both or two broad, and short pointed, with 2 or 3 Nerves running along them. The Flowers grow at the top, many together, one above another, as it were in a Spike or Bough, much larger than those of the Vetch, and of a fine whitish Purple color, which when they begin to fade, will change a little, and become more pale, after which, some small, long, slender, brown Cods, with long round, and sometimes lengthen round Grains within them, vary'd color'd.

VIII. The sixth, or narrow Leaf'd, or smaller Wood Orobus. In Root consists of 5 or 6 long, slender, tuberous Cods, not much unlike to those of the Alfhol'd or Penny, but slender, blackish on the outside and white within. Its flower, brought

crafted Stalks, about a foot high. The Leaves stand by couples, being long and narrow. The Flowers grow on long Footstalks, of a pure white color, and the Cods which follow, are long and black, with somewhat large black Grains within them. The Figure here given, is defective, the Cutter having been sparing in his Labor, in not adding to it its Vixous long Cods before named.

IX. The Plants. The two first grow only with us in Gardens, the third grows Wild in fields, about Hedges and Boifhes, and has been found about Higlgate and Pateras-Church, near London. The fourth grows Wild about Norborne in France, and is Nurft up with us in Gardens. The fifth and sixth grow in shady places, as Woods and Forests.

X. The Times. The first four Flowers in June, July, and August, and their Seed is ripe in about a Month after their Flowering time: the two last about the end of April, or in May, and their Seed is ripe in June.

XI. The Qualities. Of all these, the first or Common Orobus is only used in Physick, and of that Plant, the Grain chiefly. It is hot in the fifth degree, and dry in the second, Aperitive, Abfolute, Diuretic and Vomitif, Pectoral, a little Cardiatic, and also Aperitive.

XII. The Specification. It opens Obftuflions of the Vifera, cleanses the Bowels and Lungs of thick Humors, provokes Urine, gives ease in the Strangury, purges the Bowels downwards; diffolves the Tunics of the Spleen, cleanses and heals fmall Ulcers, is good against the Biting of Serpents and mad Dogs, gives ease in a Tentemus; and is faid to relieve in Conuftrations, it also breaks Carbuncles, and cures the Skin of Determinations.

XIII. The Preparations. Of the Grain there is made, 1. A Strong Decoction in Winer or Water. 2. A Meal; 3. A Vifage; 4. A Cataplasm of the green Cods, Stalks and all. The Virtues.

XIV. The Strong Decoction of the Grain, in Wine or Water. By its Bitterness it clears, and opens the Obftuflions of the Vifera, chiefly of the Lungs, Liver, Spleen, Stomach, Mënuftry, Keirs and Infections, cleansing those parts of purulent, thick, and mazulous Humors which affect them. Floy Lye, it is fad in the Emperor Augufus's Epitaphs, that he was Cured by Eurydice, viz. this Orobus, whose Grief was supposed to be tough, purulent matter infifting the Lungs, and not liable to be expel'd. It gently purges the Bowels downwards, and being taken Every Morning, it eafes the Spleen, and opens its Obftuflions, mollifies the hardnefs of the Keirs, and is good against the Bitings of Serpents, mad Dogs, and other Venemous Creatures, being taken mixed with Wine or Vinaigr, and to affi it provokes Urine, gives ease in the Strangury, and cures the Tentemus, if the Patient be not reduced thereby to a deep Conuftration, but an incipient Conuftration, whether Pining, or Phthisic, it Cures by taking away the Obftuflions which hinder the Nutriment from going to the reftorative parts of the Body, and by healing the Ulcers of the Lungs easily begi'n. Obscurly it heals Wounds, old Scars, and burning Ulcers by vifaging them therewith, whether in the Month, Secrets, or other parts.

XV. The Meal. It is made (without steeping the Grain in Winer to take out its Bitterness, as some do) by parching it till its Hall's break, then grinding it, and fifting it through a fine Sift.
Chap. 724. English Herbs. 1223

Drain of it taken inwardly, mixed with Honey every Morning, gently purges, provokes Urine, and kills Worms in the Belly, and without gives a good color in the Face. It has indeed all the Virtues of the former Decocition, but it is said that if it is taken too large a Doze, it causes the Head- aches, and to make Bloody Urine, so powerful a Diuretic it is. Mixed with Money as astringent, it cleanses, dyes, and heals old running Sores, and foul filthy Ulcers, Fissula's, Cankers, &c. whether in the Mouth, Throat, Soree, or any other parts; fends hurt Tumors in Women's Breast, and draws out the Poison from the Bitings of Serpents, mad Dogs, &c. being applied; It is also fald to cure the Ick, break Aphtasias, open Carbuncles, &c. if made into a Cataplasm with Wine, and laid thereon.

XVI. The Pottage. The Grains is fift steeped in Water till its Brine is gone, then parched till the Brine break, and after made into Meal as before. This made into Pottage with Water, or Milk, or Water and Milk, is said to be eaten (mostly in hot climates) it Nourishes much, and reforms in Contumacies. If the Pottage is made with the former Bitter Meal, and applied to the Skin, it is said to take away freckles, and all other External Affections thereof, melting it oftentimes with the aforefaid Treacle.

XVII. The Carapage of the Green Ceds. Applied to the Hair, (as also their Juice) it caueth it to become of a black color.

CHAP. DCXXIV. Of the VINE.

II. The Kinds. They are to be considér'd, either as to the Country, or the Species of the Grapes. As to the Countries, those which are chiefly known to us, are 1. Our English Vines. 2. Rhinthis, or German. 3. Vigna, or Italian. 4. Spurina. 5. Tho. of the Countries. 6. Portugal. 7. Tho. of the Alberdes. 8. Tho. of Florida. 9. As to the Species of the Grapes, there are, 1. Muscatel White, whence comes our Rhinthis Wine. 2. The French White, whence French White Wines. 3. French Red, whence French Clarets. 4. The White Portugal, whence White Port-O-Port and White Lisbon Wines. 5. The Red Portugal, whence Red Port-O-Port Wines. 6. The Malaga Grape, whence our Malagac Rallions and Wine. 7. The Greek Black Grape, which gives a very fweet Buckthorn Wine. 8. The White Muscadine Grape, which is a very great Grape, sweet and firm, from some of which Buckthors, (as Parkin's Eyea) have been weighed Six Pounds, and some of the Grapes half an Ounce. 9. The red Muscadin, which is as large as the White, and differs chiefly in color, from these two half come the Muscatel Wines. 10. The White Frontinach Grape, which is of a very sweet and delicate Taffes, and smells like Musch, whence the pleasant Frontinach Wine. 11. The Tost Grape, which is black, which yields the Tost Tafles, or a very sweet Taffes, and black color, or very deep red, with which they color other Wines. 12. The Aliant

Grape, whence our Aliant Wine, which is ot to deep a red, that no other is thought to be compurable to it, and therefore is called Spaniards Blood. 13. The Barbor Grape, whence our Barbor Wine, of to deep a red, that it is commonly called Black-Wine. 14. The Sherry Grape, whence our Sherry Wine. 15. The Canary Grape, whence our Canary and Pale Wines. 16. The White Madera Grape, whence our White Madera Wine. 17. The Red Madera Grape, whence our Red Madera Wine. 18. The Domíño Grape, thought to be the use Zince Pliny, lib. 14, cap. 3, which he makes to be Phinis Alexandrinus, describing it by those very words which Theophrastus does, but is a kind of Raisin-Grape. 19. The Raisen of the Sun Grape, which is a very large Grape, and confits of very great Clusters, of a reddish color when it is ripe with us, but in its Native Country, which is very hot, it is commonly covered with a notable Breech. 20. The Stonefish Grape, which is a Raisin of the Sun Grape, and grows near Asia in Putezioni, as Caesar says, yielding a red Wine of a very pleasens Tafle. 21. The Carolina, or Frucruin Wine. 22. The Cannabis, or Fair Wine, which is a fair large white Grape, of a Fox-like Smell, and a firm Subftance, which when fully ripe, is a very pleasing Grape, very much gratifying the Palate. 23. The Corinna, or Syrian Red Grape, which is a small Grape, and yields a very deep Blood red Wine. I remember that when I was in Carolina, one Guerra a Frenchman, made in one Year about two Hundred of it, (from Vines which grew Wild in the Woods,) which was not fo fuddently Sweet as Tent, but when I drank of it at his House, I then thought it to be the pleasantest Wine I ever drank in my whole Life: It was very fine, not of foil thick a Body as Tent, but of a profound Red, flaming every thing of so perfect, a Crimson color, as not easily to be obliterated, tho' upon the fpue. Those are the chief of those Vines of Grapes, which we thought good to take notice of in this Work; and which are most known amongst us: We own there are a Bait number more, and possibly a great many which never yet came to our Knowledge, which if we could Name and enumerare them all, would be as little use to the Phyfician, as they are of profit to us who never live or heard of them for that reafon, we omit any further Defcriptions concerning the fame.

The Descriptions.

IV. The great diversity of Vines, is equal to that of the Grapes, to many of whole great Numbers, we can give no Names. John Tradescant faid, that he had 20 sorts growing with him, which he never knew how, or what to call them, but foing that in their Branches, Leaves, manner and form of all Grapes, there are many Varieties seen to be but one and the fame, we shall give here an account of them all, their great differences being chiefly in the several Forms, Colors, Tiffs, and Magnitude of the Grapes. The Root is woody, not very great or thick, but rough and long, ending our many Branches, which spread lat about and deep. Being Maturated, and where it has grown a long time, it comes to have a pretty great Boughs, or Stem, spreading out its branches every way (if it be suffered) almost without end or measure, infmall as some Vines growing in Woods, and near to very tall Trees, of about our hundred Foot heighth, which have been to have climbe up to the highest parts of those Trees, and to have spread themselves out over...
Vine Garden.

of the young Branches, and sometimes from the Body of the elder Branches, break out on every side, broad green Leaves, cut in on the edges into (for the most part) five divisions, and visible toothed or dent'd about. Right against the Leaf, and limnige at the further end of the Branches, come forth long, twining Tendrils or Clusters, winding themselves about any thing which stands next them. At the bottom of these Leaves, come forth Clusters of small greenish yellow Flowers, and after them the Grapes growing in Clusters in the same manner, but in various Forms, Sizes and Magnitudes, having as many different Colours and Tastes; for some Branches are white, some open, some exceeding long, with Branches adjoining, some more compact without Branches spreading from them; Some Grapes are round, some oval, some long, some a little corner'd, as it were square: Some Grapes are very great, some in a mean, some lefer, and some very small, (as the small Curants which the Grocers sell, of which we shall speak in the Second Book of this Work next following.) Again, some Grapes are white, some red, others blue, others black, and some again are party-colored. And as to their Tastes, some are absolutely sweet, some of a coarse
OBSERVATIONS.

IX. 1. If you would make a Vineyard in our cold and moist Climate, chuse a whole EVE, dry, and warm place of Ground, shelter'd with a Hill from the North-West, North, and North-East Winds, and open to the South-East, South, and South-West Sun, let the Earth be well dig'd, deep, broken small, and cleared from the Roots of Weeds in Summer-time, before Michaelmas; then in fair open Weather in December, plant your Rooted Vines, of three or four Years old, in even frail Banks, about 6 Feet and a half, very shallow, yet so that their Roots be covered; and between every Rank of Vines, let there be a Path of 4 Feet broad, that you may easily pass between the Banks.

X. The first Year after this Planting, do not prune them too much, but let a Skea close by each Root, of about 4 Feet high, to which softly tie the strongest Shoot, and let the other Branches fall down as they will, and in April following, or beginning of May, just as they bud forth Leaves, bow the tops of each Vine Arch-wise to the next Skea, and there tie them; it may not fly away, and from this bowed Branch, will come out New Shoots, which will produce Grapes which will hang down to the Earth, and rofe will be the finest which will be made upon the Ground.

XI. 2. This is all which is to be done to them until Pruning time, which is from the latter end of January, till the latter end of February, and then you must cut away this Branch which was tied the last Year to the Skea, and Arch'd down, even as low as the lowest Eye, but one or two at the most; and then tie up another of the strongest Branches from the Stock, instead of the former, Pruning away all the other Branches within an eye or two of their bottoms, for the lower Branches you leave to the Root, the more Grapes you will have the Year following.

XII. 3. The Ground in your Vineyard must be dug up every Year, tho' not deep, both between each Vine, and also the Paths between each Rank; and first Mould out of the Paths, is to be thrown to their Roots, and so laid smooth again, and clear from Weeds every Spring; the Weeds in Summer must be Mowed up often, for the biter the Earth is kept, the better will your Vines thrive, and the larger and better Grapes will be your Grapes; but the Earth about the Vine-Roots must not be flirmed in Summer, nor in their time of Bearing.

XIII. 4. The Elder the Vineyard grows, the deeper it should be dug, and turned up yearly, and some very old rotten Dung or Alhes should then in February or March, yearly, or every other Year, be mixt with the Natural Earth, but too much Dung, (especially if it be new) is not good, and Alhes are much better than Dung. The Elder your Vines are, if they be Healthy and Sound, the larger and better Grapes will they bring forth; but when you find them to decay, you must for young ones.

XIV. 5. To increase your Stock, or Hve of Vines, you must either lay new Branches in the Earth, or else plant Cuttings, both ways they will be apt to take Root, and in a Year or two, will be ready to Transplant, and dispose as you have occasion, and whilst they stand unrooted, these new Plants must be yearly Pruned at the same time with the Stocks, viz. thru' the whole Month of February, and after the same manner.

XV. 6. And therefore to get new Roots either to Plant your Vineyard at first, or to supply the Stocks as they decay, you must take them from those produced by the former method of Laying or Cuttings, which were partly rooted in Earth, that they might take Root in Winter, which in about two or three Years time will be well rooted, so as they may be removed. Or you may take Suckers from the old Vines or Stocks, which may answcr the end full as well.

XVI. 8. But if you will raise a Nursery from the Cuttings of Vine Branches, let them be the Cuttings of that Years growth, which Plant in a Nursery a-part, of good rich Mould: any Cuttings almost will grow, but the largest and strongest Branches of that Year afford the best; those Cuttings must be about a Root, or Root and half long, consisting of four or five Joints or Eyes at most, whereon two must be thrust into the Earth, and one or two left above Ground: those Cuttings must stand in the Nurseries 3 or 4 Years to get good Roots, and then they may be Planted in the Vineyard. The Cuttings from Branches which have bore the same Year, and were not much shaded from the Sun are left.

XVII. 9. Vines proper left in a dry, gravelly, or Bones Earth, Clay, or any stiff or wet Soil, is disagreeable to their Nature, and a rich black hum'd Earth, will cause them to grow too much into Wood, and to bear but few Grapes, and those commonly Marlbe, that is flat, or ill shaped, and not well cal'd. Generally all Vines affli'd an Eastly or Southly Soil, and proper not upon a Soil or North Wall; and they ought to be defended with high Hills or Trees, from cold North-West, North, and North-East Winds.

XVIII. 10. Every Winter the Earth about the Roots must be opened, and some good old well rooted Dung or Alhes must be added to the Earth, and well mixt therewith, (as is before advis'd) and is applied to the Roots of the Vines, which being Planted under good Walls, and well spred, and Nailed thereto, will bear in most Years good store of Grapes. The time of Pruning them, we have told you before, but some begin that work at the latter end of December, for the new Shoots only bear Grapes, therefore in Cutting of the Branches, an eye or two must be left to be top shoot, as again, for if you cut close to the old Wood, few or no Branches from thence will proc: So that in Cutting or Pruning of Vines, the rules for Pruning other Fruit Trees must be followed: as those to be cut off close to a Bud, but Vines must be cut about the middle, between two Buds.

XIX. 11. A Fertile Soil is fitt for some Vines, niz. such as bring forth Fruitful and fat Vines, which is every black Earth, that is not very close nor chummy as Floricanus fays: Colomeilla advices to have regard to the kind or nature of the Vine, to plant it in a Soil agreeable to the Earth of the Country where it was a Native. A poor and lean Vine may be Planted in a Fat and Fruitful Soil that is of its own Nature, but yet not too Fat. A Fertile and Fruitful Vine may be Planted in a leaner or more Steril Ground. A large and spreading Vine, may be Planted in a more close and compact Earth. A Vine of few Branches, may be Planted in a more fertile but Fruitful Soil. But fays Colomeilla, the Vine delights not to grow in a Soil too much Dung'd, let the Dung be of what kind forever. But Mould mixt with some Shavings of Horn, being disbursed about the Roots, will Encrease the Vine to become very Fruitful.

XX. 12. A late French Author fays, that tho' some are of Opinion that Vines should be Planted in February, or earlier, yet those fays are respectively Pruned in March, and that if a Vine be not
Salmon's Herbal. Lib. 1.

not Pruned, the Grapes will not be large nor well talled, and behides, that it will not be of any long Life. But if all the Branches are to be cut off: That the beet Branches flooring out the largest Stems, are to be cut off at 4 Eyes, and the other Branches lower, or beneath them, to 2 Eyes, or such, as leaving an Inch of Wood is to be left above the Eye, at the upper end of the Branch: That the Cut must be made floping on the contrary side to the Eye, for fear of prejudicing it, for when the Sun is in motion, the Vine weeps very much: But if the Slope were on the Eye side, it would in a manner be drowned by the Tears: And that the Vine be diff-badded and tied up in May, June and July, that the Grapes may thrive, and grow perfectly ripe. That the lower Branches are Pruned to 4 Eyes, that they may give us two or three good Branches, which may be cut to be Pruned the Year following, whereby you may re-tract the Branch before Pruned to 4 Eyes, with all the roll flooring from it. That the 2 new Branches springing from the said lower Branch, are to be so Pruned, that 4 Eyes may be left to the highest Branch thence, and 2 Eyes only to the lower of the Same. But if the first said lower Branch gives but one Branch, that is then to be Pruned to 4 Eyes; If it gives no Branch, then you go up to the upper Branch which has 4 Eyes left, which is the 3 and 4 Branch, you must cut off the two higher Branches, and Prune the two lower, leaving 4 Eyes to the higher of the two, and two Eyes to the lower.

But since we scarcely ever Plant Vineyards in England, but place our Vines against Walls, you must dig a Trench about a Foot and half broad, and prepare your Layers or Cuttings, where you have planted your Eyes, and cut off a small part of the Fibres, and lay your Layers in the Trench 2 Feet in breadth, that the Lattice may the sooner be formed, after which, lay on some Dung, till the Trench be quite filled up, to will the Vines floor out admirably: If the Earth be hot, Cow-dung is the most proper, but if that can not be had, then take Horse-Dung which is well and perfectly rotten, and discharged of its heat: But in a wet and cold Ground, Horse-dung with a Tilt, especially in the Night, from Sun-fet, till the Sun is nearly an Hour high, and if it is a Frosty Season, all the day long.

16. Besides the Vines we have enumer-ated, there are more than an hundred sorts of others, to which we can give no Names, and many of which are very good kinds; but we in this place are to consider which of them will grow best with us, and which are the best, which are 1. The Clutter Grape, or small Black Grape, which is first ripe with us, which are thick set on the Bunches, and when ripe, black and well tailed. 2. The White Muskadan Grape, which has large Bunches, and has great Grapes, sweet and good, and ripening well most Years; it is said, that it is as large as the White, but requires the most Sunny places, because it ripens not here so well as the former. 2. The Bronniskipe Grape, which is white, sweet, and Muskadan, requires to have cold Seasons, come not to perfection here. 3. The Border of the Sun Grape, which is large, red and good, and in a warm place ripens wonderfully well. 4. The Purty Vine, or New England, or Canada Grape, which is a White Grape, ripens with the late, and but thinly set on the Bunches. To these we may add, 7. The Barter Grape, which is the largest Grape we have, but are very low, and ripen not with us, except by accident, as having an extrem hot Season. The Bunches are great, and the Grapes large and white, whereby they make an admirable show on a Wall. Our chief use of this Grape, is to make Verjuice of it, which is very excellent. If by chance in a very hot Year, it comes to ripen-ness, the Grapes are said to be pleasant. There are many other sorts of good Grapes, which possibly may grow admirably well in our Country, concerning which you may consult the Vinearces.

XXV. 17. The juice of the Grapes is, the Greeks call Υψισ, the Latines, Oenbacium, and Argilgia: but we in English, Perjuice. The Perjuice of all Grapes is divided into White, Red, Rose, or Violets, and of these there is much, many, and varieties in use.

XVII. 14. Our Vines in England, begin to put fruit about the end of April, and are in Flower about the latter end of June, not very long after it will be good to flop the Branch some distance from the Flowers, that the Grapes coming on, may have the more Nourishment, and the Sun not drawn away from them, or Planted on other useless parts.

XVIII. 15. In the end of August, cut away such Branches and Leaves as keep the Sun from the Grapes, so will they ripen the better, and some early kinds will be thoroughly ripe in September, others in October, but it often happens, that such as are late ripe, are spoiled by Frods, unless they be defended with a Tilt, especially in the Night, from Sun-set, till the Sun is nearly an Hour high, and if it is a Frosty Season, all the day long.

16. Besides the Vines we have enumer-ated, there are more than an hundred sorts of others, to which we can give no Names, and many of which are very good kinds; but we in this place are to consider which of them will grow best with us, and which are the best, which are 1. The Clutter Grape, or small Black Grape, which is first ripe with us, which are thick set on the Bunches, and when ripe, black and well tailed. 2. The White Muskadan Grape, which has large Bunches, and has great Grapes, sweet and good, and ripening well most Years; it is said, that it is as large as the White, but requires the most Sunny places, because it ripens not here so well as the former. 2. The Bronniskipe Grape, which is white, sweet, and Muskadan, requires to have cold Seasons, come not to perfection here. 3. The Border of the Sun Grape, which is large, red and good, and in a warm place ripens wonderfully well. 4. The Purty Vine, or New England, or Canada Grape, which is a White Grape, ripens with the late, and but thinly set on the Bunches. To these we may add, 7. The Barter Grape, which is the largest Grape we have, but are very low, and ripen not with us, except by accident, as having an extrem hot Season. The Bunches are great, and the Grapes large and white, whereby they make an admirable show on a Wall. Our chief use of this Grape, is to make Verjuice of it, which is very excellent. If by chance in a very hot Year, it comes to ripen-ness, the Grapes are said to be pleasant. There are many other sorts of good Grapes, which possibly may grow admirably well in our Country, concerning which you may consult the Vinearces.
The Virtues.

XXXIX. The Juice of the Leaves and Twigs. It is Cooling, Drying, Altingent and Healing, Mixt with Honey, it makes a good Lotion for a sore Mouth or Throat, or Sores in the Privy parts, to wash, gargle, and bathe therewith, it also stops Vomiting, Fluxes, Spitting of Blood, and Women's Confits.

XXX. The Decotion of the same. If a little Rock Alum be dissolved in it, and it be then scoured with Honey, it has all the former Virtues of the Juice, but drunk (without the mixture of the Alum and Honey) it is of good use against the Pains.

XXXI. The Tears of the Vine. These are dropplings of the Branches of the Vine, when cut out of due time, or too late in the Spring, dried, it is good either to dissolve a good Bone in the Reins or Bladder, or to expel and drive out Sand, Turbouas mast, Gravel, and small stones out of those parts; and possibly it may be more effectual in this case. It can be taken the same with Honey, for that Honey has not only a power of Dissolving and Cleaning, but also of making the Passages smooth and slippery.

XXXII. The Juice made of the Aperitives of Vine Branches. It is very effectual against the Gravel and Stone in the Reins, being drank either simply or with white Port Wine. The Lye mixed with a little Vinegar, being drank in a Bath, allays Inflammations and pains, and cures Warts of the Arms or Fundament, eases the Pains thereof, and dissolves the Piles, and other Turmons. The did Lye is good to wash places that are burnt with Fire, and mixt with Vine and Vinegar, It is good against the swelling of the Spleen, and helps Frettings and Gillings in any place. And mixed with Wine, it is good against Antwine Fire.

XXXIII. The Aperitives of Vine Branches. Made into an Ointment with Hogs Lard, it is good against hard Turmons, cleanses Piles' and hollow Ulcers, and heals them; helps Pains, Cramps, and stinking of the Nerves. If they are mixed with Oil, and applied, it dissolves Simple Contusions, cures the Bitings of Mad Dogs, and the Wounds of Scorpions; And made into a Compound with Vine and Vinegar, and applied, it cures, or washes Wens, and other Excrescences of the Body.

XXXIV. The Ointment of the Aperitives. Take well Calcul'd Vine Afper 8 Ounces, Sal Nitre in fine Powder 3 Ounces, Tobacco in fine Powder half an Ounce, Golden Colored Palm Oil, (one Old or in 2ttering 12 Ounces), Oil of Rhodium 3 Drums: The Palm Oil being melted in the heat of a Bath, put in the other Ingredients, and mix them well together. It differently dissolves and dissolves even Callous-hardnecles, clefts pricks in the Nerves and Joints, and is profitable against Gouts, Sciatica's, Simple Contusions, old Sores, Ulcers, Piles, Tumors, Ring-Worms, Herpes, Impetigo, Worms in the Face and Skin, and other like rebellious Maladies.

XXXV. The Lotion or Wash. Take the Juice of the Leaves 5 Ounces, Red Port Wine to cover; Honey 4 Ounces, mixe and make a Lotion. It is good to Wash and Gargle, and heal Sores and Ulcers in the Moutth and Throats, and also to cleanse and heal Ulcers in other parts. Put into the Eyes, it stops Dullness, clears the Sight, and heals Sores and Ulcers therein.

XXXVI. The Oils. The first gathered full ripe grapes being eaten, Breasthe the Stomach, refresh the Vital Powers, causes a good Appetite, and cool in Fevers. Those of a Blood-red Juice, are good to stop Spitting of Blood, and other inward Bleeding, because of their good heat, but almost all sorts of Grapes, if eaten in too great a plenty, are apt to cause Fluxes, and to do other Preciparions to the Body, not easily to be recovered, whereas moderately eaten, they are otherwise a singular advantage to it.

XXXVII. The Perjuice. It is a Juice pressed out of any unripe Grapes, but more especially out of that kind of Grapes which will not ripen with us, being a very fair large Grape, and making very large Bunches. It is called Omphtiacum, also Saccharous Omphtiacum. It is a pleasing food for man Juice, fit to be used in Broths, Meats and Sauces, to acuate and strengthen the Appetite, also to refit Vomiting, and to refresh and accelerate theainting Spirits. Made into a Syrup with White Sugar, it is very grateful to the Stomach, quenches Thirst, and extinguishes the heat of Fevers. Mixt with Honey, and used as a Lotion or Gargle, it cures Sores and Ulcers in the Mouth, and Throat, Etc.

XXXVIII. The Must, or New Wine. It is pleasing to the Palate, but nor so wholesome as that which has Age upon it, and is very fine. Several sorts of Must are apt, that are made to the Body, but particularly Nou cany, creates Oldflations.
in the reins, and many times caues a Strangury, or a kind of Hoppage and heat of Urine: But accord- ing to the Variety of Grapes, and the Climates and Winds, in which they grow, such are the Quali- ties of the Mutf, some are laxative, some Coarctm, some Papers, Etc., and according to those Qualities or Properties, varieties of Preparations, are made of them. 

XXXIX. Red, or Sap, Syrup of Muff, or New Wine. Take Wine newly pressed from ripe Grapes, White or Red, but it over a gentle Fire, or rather in Balneo, to the thickth of Honey. It is of use for Quinsy and ill Stomachs, for Paintings, vomitings, and want of Appetite; it is alfo good for Sores and Ulcers in the Lungs, Mouth and Throat, becaufe it is not only Afflbitive and Healing, but alfo repelis the Furf of Humors, having a Syrupick quality in it, (but is more led Syrupick, according to the kind and Qualities of the Grapes it is pressed from,) you may take it Morn. or Noon, and Night, as much as a Walnut at a time, alone by it, for to strengthen the Stom- ach, provok Appetite, Etc. This you are alfo to Note, That in what Medicall Author it are not reafoned, that, or any other Wine, her firmly Writen, without any relation of what it shou’d be made, that this Red or Sap, is the thing which is always intended. 

XL. Wine Vermomned or Peromced. All Wines whatsoever, to strengthen the Stomach, clear the Heart, revive the Spirits, and exaltifie whole Nature: Strong Wines strengthen most, but many of them are heady, and being drunk in too great a measure, are not only a drowame on the Blood and Spirits, and caufe Fevers. Weak Wines cleanse much, and that by Urine, but being too plentifully drank, are apt to caufe Rheumattifs, Gouts, Etc. The middle fort of Wines (between fine and coarse) are wholesome, and fittted for our Bodies. All forts of French Wines are either Coars, Rheumattifs, Sand, Gravel, Stone, and Terreous Humors in the Urinary parts. All Syrupick Red Wines, as Armagnac, Gurche, Etc., fpare the great Flux of Urine, and are preva- lent against a Splenite. Choice Camary, as Palm Wine, Modena Wine Red and White, Red and Port Wines, and Lisbon Wines, Red and White Fort Wines, and fuch other like Strong and Generous Wines, are great Cordials, and ought to be chosen when used in Cordial Compositions, because they add Life and Spirit to the Medicament, and make it more Gratific to the Stomach and other Bodies.

XLI. Brandy, or Common Spirit of Wine. It in made of vell Veronica, and sometimes of Privet’s Wines, in a Copper Vessel Tem’d within, with its Head and Refrigeratory, or Warm, dressing it off fo long, till it becomes of fuch a Constitution as to be but jaff Proof, which may be again refitted in Balneo, if you fo pleafe. This Spirit being old, when the Fire is as it were out of it, it much bet- ter than when new drawn, and then a fhall Drum being taken of it now and then by it left, (or mixed with white Sugar, or Lane Syrup, as fome will have it) is a angular Cordial, a ftrenthenor of the Stomach, a Reviver of the Spirits, a chearor of the Heart, an evoker of Natural heat, and a cauder of Digestion; warming of the Body, and a quicknor of the Blood; and the Blood, growing, and becoming ripe, of it, is Blackberry, or Brambleberry Brandy, Mal- berry Brandy, Raspberry Brandy, Medulla Cherry- brandy, Black Cherry brandy, Etc., and with it fereval Tinctures are drawn out of particular Simples, as from Catechu, Cochinelle, Saffron, Etc. much better than can be done with the leaft recti- fied Spirit of Wine.

XLLI. Spiritus Vini, Spirit of Wine. It is made from Brandy, by Diffillation in a Copper Kefel, where the Head Turn’d within, joined to the proper Vessel and Refrigerato, or Warm, while the Work till the fabulous and fineft parts are ſent, which you may know by the fagge, from which it may be feared times refitted in Balneo, drawing, off the bulk, and leaving parts, till the Spirit is high, and no Humidity remain which will change: Where Noise, that the Office of the Still being covered with a four fold thin Paper, or thick Cloth, the Spirituous parts will only penetrate, and the Watery tarry back again. It is a Regular Meffinga- rum to make Extravag, Tinctures and Elixirs with, and performs many other Admirable things in Chymistry, as all Learned Physicians abundantly know.

XIII. Philosophical Spirit of Wine. Take Pure Fowers of Salt Armoniac, or Sal Armoniac other Sublimes from common Salt, or Oiyes, affay thence the best Alchohol of Spirit of Wine, or Spirit of Wine perfectly designated, or thus Di- ftilled from Salt of Tartar till it is free from Alcohol, as much as to cover top it 3 0 5 Aletrs, being in a Flag Red clofe, deep with Wine, let it stand only in a Blood warm Night, 13 or 30 Days, that the Spirit of Wine may fully unbind, and be impregnated with the heat or Sorph of the Salt Armoniac, to wit, make his Fiberous Passion or Salt, which keep for life. But Kirkington advi’d, after this, to Distil off the Spirit from the remaining Salt, Celebrating and Distilling off the Spirit three times. This Philosophical Spirit of Wine, is a Meffingrum to draw from it the best Simple rectified Spirit, for extracting all Sorts of Vegetable or Mineral Tinctures, making of Elixirs, Perfumes, Etc. One of its uses is to extract a Bloodred Tincture from the Ghia of Antimonials and from other Mineral and Metallic Bodies. It is not much unlike, and possibly not inferior to that of Buff Polymines, mentioned in our Pharm. loco. in v. cap. 9. fiell 22. having indeed all those Virtues. It is properbly used in Rheumattifs, Gout, Stone, Jaundice, Dropie, and all inward Obstructions: They that pledge to use it may possibly give it Thanks, for it penetrates the Secret use of this moti Excellent Spirit, some few Drops (from 15, to 30 or 40,) may be given in a Glas of Generous Wine.

XIV. Raisons or Dryed Grapes. They are Grateful to the Stomach, strengthen the Bowels, good against Coughs, Colds, Catarrh, Althma’s, Wheezings, and refriue in Contumacions, being often eaten alone, or every Morn and Night with choice Old Chaffre Choce, and White Ship- fynke, by which way of eating them, they flop old and inveterate Fluxes of the Bowels, and For- tifies as it were the whole Body: The Daunfion- Raisons have a little Turfules in them, and are very pleasing to the Stomach: The Malaga Raisons are alio of singular good use, but the Raisons of the Sun exceed all others for all the purpojes already mentioned.

XV. Honey of Raisons. Med Paflinatum. Take Raisons of the Sun horned, and bruised in a Marble Altar, 2 Pounds; warm Water 6 Pounds; infult 24 Hours, then boil or Balneo to the Con- tamnation of the bulk, and press out the Liquor strongly, with which Clarify Honey a Pound and a half, boil to its due Confinacy: If instead of the Water, you take Camary, Moro, or Tent, the Medicine will be the better: It is a choice thing against Althma’s, Colds, Coughs, Catarrhs, Contumacions, Hoarfltes, Wheezings, and other like Diffickes of the Breth and Lungs, Etc.
Englijh into Now Pound a repeat. Precious, thus, which is peculiar for Children against Convulsions, the Falling Sicknes, Chins, and the Riches.

XVII. Decotion of Grape, or Raison Stones. It is good to help Fluxes of Blood in any part, as Bleeding at Nose, Spitting and Vomiting Blood, inward Bleedings, Bloody Flux, and Pilling of Blood. It hops all sorts of Fluxes of the Belly, strengthens the Stomach, and prevails against a Diabetes.

XVIII. The Poudre of the Grape or Raison Stones. It has all the former Virtues, and may be given from half a Drachm to a Dram in a little Honey of Raison, and then washed down with a Draught of the Decotion of the Stones. The Poudre outwardly applied, is a good Specynck in healing the outward

XVIII. Acetum, Vinegar. How our Distillers make Vinegar, we have taught at large in our Drona Medicin, bid. 1. cap. 24. fcel. 50. to that it is only to repeat that again here. But for such as cannot go that way to work, for want of Necessaries, it may be done another way, after the following manner. Make a Poffe of Tea, Milk, and White Wine, adding to every Pound and half thereof, half an Ounce of dryed Salt, reduced in a very hot Mortar to a fine Pouder, let all be brought very well together, and let in Digestion 24 Hours, then make it all out into little Loaves, which Bake in an Oven with a soft heat; take those Loaves and steep them in the strongest Wine Fumgar, (in every Gallon of which, 4 Quarts or more of fine Powdered Salt is added,) with which make a Poffe again, and make into little Loaves, and Bake as before. This Work so often repeat, till the Loaves will be no more disfigured in the Fumgar, or rather receive no more Acidity from it, which done, put a sufficient quantity of this Brine, into 4, 5, or 6 Gallons, or what Quantity you please of Strong Wines, (especially if you like to use it thus from the beginning to grow acid,) and it will in a very short time be converted into good Fumgar. Vinegar if it is good, and very acute or sharp, is an excellent Stomachick, and takes away all flux of Blood, an ingredient in the most excellent Sallves. It is a most singular thing to quench Thrift, abre the heat of the most violent Fevers, relit Poisins, and is generally an ingredient in most Liquid Compoteionts against the Spotted Fever, Malign Fevers, Measles, Small Pox, and the Plague or Peltulance it self; and all sorts of Contagious Infections, and Phletham Discomfits. It is Specynck, and good to stop all sorts of Fluxes of Blood, whether inward or outward.

XIX. Spirit of Vinegar. Spiritus Acetii, Acetum Distillatum, a. Tabi of the hot Wine Preparatur, put it into a Glass Still, and with a gentle Vine in Balancen Mixtus, or in Asbes, drub off the Winy without Taffe, which will be nearer a quarter part than is generally received, and force over the Spirit. If the Spirit is for Physical use, you must take heed of Buming, lest your Preparatian smell of the same. If it is for a Metalline use, drub off the Winy at the first Distill violently, and till a red Spirit ascends, and all be come over.

II. Or thus, according to Clowfus. Take 6 Quarts of Vinegar, and Distill in a leuakwe Balancio M. till but one Quart remain, then in Sand or after, draw off the remainder to dryness, celebrating two or three times upon the flames. Ill. Or thus, which is yet stronger. Inflate Vinegar in the thickest part of a Flask, and set it to Crystalize, which Crystalize past, by distilling them in a Grain of the Vinegar, and Crystaline again; take thofe Crystalles, and make them into talls with Bake, and then drive the Spirit thus a Retours, which after retijke, so will it be very airy and Crystalline. IV. Spiritus Aceti Senseturi. Take Essences of Distilled Vinegar, Caline them dry, and add the same Spirit of Vinegar, and draw it off again in Sand, Celebrating so often till all its common or fast Salt affected with the Spirit, This is Radical or Alcoholic Vinegar. V. Or thus. Take Essences or Loose of Vinegar, Distill in a Vesselly with its Refrigeration, so will you have a Ewy Spirit, which will distill off Metals Stones and Minerals. VI. Spiritus Aceti Terematicius. It is made of Vinegar and Tarantino, Distilling them in a Retours, then separating the Oil and Spirit from the Tumgt, or Water. VII. Dr. Ambrose's Spirit of Vinegar, with which he made his Aurum Potabile. Get three or four Gills Still, which will hold a Gallon or two quarts, and man the Balancim of the strongest Red Wine Fumgar. (Fumgar of White Wine or Vines, will be too weak) made of Red Wine, or of Canery, or Malaccher. Put the Fumgar into the Stills, and for the inspina of the Balancum will hold, (which Balancum ought to be two Feet and a half Square, to hold many Gasses) take a Pint of this which runs first, and put it away as weak, and not fit for use, then Distill the rest to dryness, With the Still with a little of the Vines or first running; Distill again, and put away the first Pint, this Work repeat for four or five times, of a Gallon of Fumgar, you will have three Pints of Spirit, and of your six Gallons nearly to Pints. If your Spirit is yet too weak, you must Distill it oftener, this Spirit keep in a Glass close stop with a Glass Stopple. For a Quart of this Merchium, Bishop Bullon gave Dr. Anthony Thirty Shillinges. VIII. Radical, Spirit of Vinesgar, according to Margraves. Take Spirit of Fumgar, or the former Radicated Fumgar, and Distill it from Sal Armoniac, so will it be much more potent. Spirit of Vinegar attains, besides, difficulties, reflexes, cools, and has all the Properties of Vinegar, but more quickly and strongly. It is used as a Marningium, to perform Chemical Extractions with. The Terebinthinated or Radical Fumgar, is for the distillation of Stones of all sorts, chiefly of Gems, and stones of which Corals and Hartnan make much mention; and it is used by Parasites against Difficulties of the Stone, by giving it in a proper or Sphefick Vehicle. Those Authors say, that it will deflute Stones and other Stones, without any Previous Calculation, and is also profitable for many other uses. Now if it has a Power of Distinguing hard Substances without Calculation, it must certainly have much more power to do the same, after such a Preparatory Operation of the Fire. Dr. Ambrose Spirit of Vinegar, may without doubt have all the time Virtues and uses with other Spirits, but what he applied it to, was chiefly to make his Mercium, with which he prepared his Aurum Potabile, that Medicine to much Fam'd throughout almost the whole World.

L. Wine Artificial. Take Malaga Raisons freed from their Stalls, at hundred Weights, take Rainwater 30 Gallons, put the boiling Water, with the above Raisions, driving them well together, which let stand 48 Hours or more, till the Water has drawn forth all the Succuments and Strength of the Raisins; then draw off the Water from the fruit into a wooden
1230

Salmon's Herbal. Lib. I.

Wishes fail, where let it stand till it begins to ferment, Barrell it up, keeping it upon the Lees till the fermentation is over, and the Wine is absolutely done, when then if you do please, be Barrell up. This is not inferior to any foreign Wine, and much more pleasant, drinking a great deal more Acute and Bitter. It has the Virtues of other strong Wines, and may be drank entirely as other Wines. Try you please to alter its White or Pale color, and make it of a Red color, by putting it into Alkanet-Roots, which will give it a glorious Red, and thereby make it much more taking to some sort of People. When Hippocras or Scotch is Cheap, or at the ordinary Price, this Wine will (your Labour being fixt aside) freely stand you in Three Pence a Quart.

L. Hippocras, or Spiced Wine, Pinna Hippocrasia. 1. Dr. Bates Hippocras. Take Ginger, Cloves, of each one Ounce, Cinnamon, Nutmegs, of each one Quarter, Spanish Wine or Canary, six Quarts, double refined Sugar 3 Pounds and a half, mix with New Molasses 1 Quart and half a Pint, let them stand 24 Hours, then strain off, to which add one Lemon thinly sliced, and two larger Sprigs of Rosemary, often putting it-themselves to the Hippocras's Stew, till it becomes clear, in Languages or Paintings. II. The common Hippocras of the Shops. Take Ginger 1 Drapar, Cloves, Nutmegs, of each 2 Drapers, more two Scraps, White Pepper, Cardamom of each a Scraper, Cassia 3 Drapers, North Molasses Seed, one Ounce; Canary, or White Lisbon, or pure Red Port Wine 6 Quarts: Let all the Ingredients be bruised, and put into a thin Milk Cloth bag, with a Stone in it, then let it stand, and let all infuse for a Quarter of a Year, then draw it off, and bottle it up. Where Note, that some have the Spices in the Wine, which they forever mixt with Double Refined Sugar, and then let it pass through a Hippocras bag. Bottling it up afterwards: But if you would have this, or any other Liquor purely clear, you must use a Triple Hippocras Bag, made of White Cotton or Muslin, in the other Places pay the first Bag Mill Fold in the second, and what passes the second, mill fold in the third and half: You must order them so, that the Point or Corner of the one may hang in the Mouth of the other, and the end of the third and half, in the Mouth of the Cap or Vessel to receive the Wine.

III. Hippocras, Extempores. Hippocras made in an Instant. Take white Peppar a Dram, Closer 1 Ounce, Nutmegs, Vine, Ginger, of each two Ounces, Cinnamon & Cloves, Spirit of Wine three Pints: the Ingredients being all sufficiently bruised, mix with the Spirit, and digest 14 days close stop in a cold place, finding the Peppar twice a day, then pour out the Tincture very hard: To the Magma or Excess, affix fresh Spirit of Wine a Pint and a half, mix, digest, and allow as before for 14 other days, then pour out the Tincture very hard, put this latter Tincture to the former, mix them, and let them fester for a or 3 days, then decant the clear, and turn it three Brown Power, which keep for use. Tincture of your intended Wine you will make your Hippocras in the Heart, of the aforesaid Tincture three large Spoonfuls, more or less, (as you would have it in Strength) mix them together, and you will have good Hippocras in a Moment. Where Noces are very fine, and Wine be of so fine a flavour, it ought to be aforesaid Diluted with Double Refined Sugar, by which it will be made more grateful to the Palate, and then letting it stand till it is Pure, you may be BOTTLE UP, Dr. Bassays, that if you add White Pepper half a Dram, to his Recipe, it will make the Composition more

Grateful to the Stomach; and for such as love Perfumes, he says you may add half an Ounce of Must Seed. All these several Preparations are very Cordial, strengthen and fortify the Head, Stomach and Bowels, in Strength to any foreign Wine, and much more pleasant, drinking a great deal more Acute and Bitter. It has the Virtues of other strong Wines, and may be drank entirely as other Wines. Try you please to alter its White or Pale color, and make it of a Red color, by putting it into Alkanet-Roots, which will give it a glorious Red, and thereby make it much more taking to some sort of People. When Hippocras or Scotch is Cheap, or at the ordinary Price, this Wine will (your Labour being fixt aside) freely stand you in Three Pence a Quart.
ing, dry in the Sun, or in a gentle Sun heat. Dioff it, and form it with the afore-referred Spirit, or with other well Refined Spirit of Wine, making it moderately waft. Let the whole Atfafs dry of it, as you dry it before; then weigh it, and boil it in the Earthen Vase, put it in a large Reverberatory Vase, fitted and well Luted to a large Recipient. Dry it with a gentle fire, increasing it 9 degrees for about 12 Hours, till the fife comes to the utmost violence: After which, the Vesfels being cold, unlace them, and you will have in the Receiver, the Volatile Salt of Tartar, mixed with the Oily parts, and much Veflem. Empty both together into a large Mafvafs, with a long Neck, which place in a Sun heat, covering it with its Head, well luted to a Receiver. Dry it with a moderate Vefle, as in the Refolution of other Volatile Solids, so will the Volatile Salt of Tartar affend Vefle, and stick to the inlike of the Head, in a White and Cryftalline form, which gathers with what Deterfary and Spodd you make, but will be perfectly separated from the Oily parts, which will affend next to this Volatile Salt. Where Note, that the Refined Spirit of Wine is not absolutely necessary in this Work, but is of no fecond importance; for embracing some part of the Acid of the Lees, and taking it along with it in its Diffillation, it fpees the Volatile Salt, fo as that you will have it in greater quantity, than when you effende it. Operations, the acid Substance of the Juice of the Grape, unites it felf with a great part of the Volatile Salt, to make the Computation of the Tartar. Whence it is, that Tartar yields not to fo much Volatile Salt as the Mafs Lees at the bottom of the Cask do, which mightily abound in a Volatile Salt, and a Subftantia Spirit. And hence it is, that the Volatile Salt of Tartar is more efteem'd, and more plentifully drawn from the Lees, than from the more Solid, and Stone Tartar. The Virtues. This Volatile Salt of Tartar is fame to purifie the whole Mafs of Blood, both by Sweat and Urine, and sometimes by Stool, whereby the Mafs of Putrefactive Humors and Maff is carried off. It is good againft the Paffie, Apofteps, Epiileps, Leaffes, and other Scares of Head, Brain and Nerves; fefits all Intermitting Fevers, chiefly Tartan and Quaranons, opens all Obftufions of Stomach, Liver, Spleen, Sandwich, Gall, Reins and other Vafe in the Body, and frees, Stool, Scurvy, and other ftabborn Difeafes. Dofe from 1 Ounces to a Scrapie, in any fift Vehicle. A Cryftalifm of Wine Lees. It is made by mixing them with Bif Rye Flour or Meal, till thoy come to a Con- fiffinly. Being applied, it is accounted an excellent thing to cafe the pains of the Gout. 

LV. Tartar or Arfcl. It is that hard part of the Lees of Wine, which floating it fell to the fides of the Cask, flicks to the fame, and becomes hard almost like a Stone. That which is taken from Rheum, and other White Wines, is the best to be prepared into Medicines: But the Red Tartar, which proceeds from Red Wine, as it yields nothing near fo much Salt, fo it is much inferior to the former, but flawless well enough for Dryers, in fixing their Colors, and for Gold-Smuits to boi their Silver in to whiten it. The White Tartar is many times given unprepared, being reduced into a Fine and Subtle Powder, from a Drains to half an Ounce, for purgative, purging hot Water-Grind. It purges the Bowels, and cleans them, as well the Urinary parts, of Slimy and Watery Humors, and is profitable againftr Cancer, Bladder-Bladder, and Womb, &c. But this Oude unprepared Tur- 

tar is feldom given, for that the Purified Tartar, alfo the Cream of Tartar, is common enough to be had, and at an cafe price; but the Tartar is thus made. Take pure white Cryftalline Tartar to Pounds, beat it into fine Powder, and divide it in 6 Gallons of boiling Spirit, and divide the boiling till it is divided; then prefently take a Vintner's Brain hot thro' an Hippocastan Bag: The Brained Liquor continually fir round with a Wooden Sticks, till it is cold, then let it refl, and in 3 or 4 hours after, the pure fine Tartar will fall to the bottom of the Velfel, in form of an impalpable and flowing White Powder, which is Tartar Purified, and is equal with either Cream or Cryftals of Tartar. The Virtues, Dofe and Ufe is as the former, and the fame with Cream or Cryftals of Tartar next fequencing. See our Spliffam, or Druggift-Shop, lib. 2, cap. 10. 

LV. Cream and Cryftals of Tartar. Diflute what quantity of White Tartar you pleafe, in a large quantity of boiling Water, which done, put it thro' an Hippocastan Bag, into a large Earthen Vefle, or Bell-Glafs underneith: Exafperate about half an hour, and let it cryftallize for 2 or 3 days, (faying what forms a top, as well as the Cryftals,) Evaporate again half an hour, and let it cryftallize, doing this fo long till you have gotten all the Tartar. What forms on the top is called Cremor Tartari, The Cream of Tartar, and that which fhoots on the fides and bottom, is called Crystals of Tartar. Where Note, that in diluving and boiling the Tartar in the Water, it ought to be done rather in an Earthen Pot, than in an Iron one, left it should draw a Tincture from the Iron. The Virtues of both these Preparations are one and the fame, and the fame with the Purified Tartar in the formerfeben, being Aperitive, Purgative, good for Cachexical, Hydrophobic and Affhmatick Paraffon, and excellent againft Tartan and Quar- 

an Agues. The Dofe is from 2 Drains to half an Ounce, more or lefs, which being reduced to very few Powder, ought to be given in the Vehicle boling hot, that it may diloue therein, and not fall to the bottom. 

LV. Tartar Emerfick. Take Cream or Cryftals of Tartar in fine Powder, or Crude Metallorum in Sabil Powder, of each a Quaunts, mix them, and divide in boiling Water, then filter, and evaporate to Dryfamity. It is the bift of all Emerficks, Operating with much Gentleness to the Paffe, Funging both upwards and downwards, and may be given from ye, ½ to ye, viij. It may be given in hot Water-Graud, or in fome Conkre or Elefury, or the Puft of a rounded Apple, walking it down with a little warm Polife-Drink, or Water-Graud. It is good againft Frenzy, Mafaels, Cures, Le- 

thargy, Epiileps, Verigo, Melancholy, Sicknefs and Wind in the Stomach, palts of the Sides, Jaundice, Dropleps, Gout, Rheum,fpasms, Pains and Malign Fevers, Tartan and Quaranon Agues; in- 

veterate Obftufions of Liver, Spleen, Reins, Womb and Meffentery, and is prefervative againft a Diffen- 

fery, and the malignity of the Plague or Pellunge, if it felf. Emerfick Tartar may be made by feral other Prefcrifons, as you may fee more at large in our Spliffam, or Druggift-Shop, lib. 2, cap. 10. fello, 15. & 16. and in Our Pharm. Beteone, lib. 2, cap. 10. fello, 48. to which we refer you. 

LVII. Spirit of Tartar. Take White Tartar in Powder as much as you pleafe, in half a large Earthen Retort Laid all over, so large as that it may not till it above half 3 parts full, which place in a fife Vase of Recruration: Make bo a gentle fire, which continues for till nearly all the Egum is come off: Then change the Receiver, and
Preparation against Hyperchondriack Differences and Melancholy, as also against Vapors, and Hyperick Fits. Dose one Dranm, more or less, in Cajan, or Caynary mixt with Guimmon-Water. See more hereof in my Pharmacopoeia Batacon, lib. 1. cap. 2. § 12.

LX. Sal Tartari : Salt of Tartar Pure. It is made of White Tartar being Calcined in a Naked Fire, in a Reverberatory, or other Furnace of Calcination; after which, the Salt is Extruded with fair Water by Exilatation, Filtration and Difcrination, after the manner of making all other fixed Salts. Or you may prepare it from the Caps Mortuum, remaining after the Evaporation of the former Spirit and Oil of Tartar, after it has been again Calcined to Whiteness, by the former manner of Exilatation, Filtration and Difcrination. This Salt is an admirable thing against the Stone, Sand, Gravel, and turraceous matter in the Kneis and Bladder; it opens all Obstrutions of the Vesica, provokes Urine powerfully, and is an excellent thing against the Scurvy, Droopis, Jaundice, and Gout, and outwardly prevents all Scurf; provokes Morbid Condyleries in the Stomach and other Bodies; and is an immediate thing against Heart-burning.

Dose from half a Scruple to a Scraple, in Ale, Beer, Water, or White Wine, &c.

LXI. Sal Tartari um Novo, Salt of Tartar with Nitre. Take Creda white Tartar, Sal Natrum, of each (in Pouder) equal parts; mix, and in a Crucible Calcin'd to Whiteness, by fifting the flame with a red hot Iron, till the Nitre is wholly conflumed, which is known by the casting of the Eruption and Burning. Thus the Tartar being Calcin'd at white Stones, fift the fame in Weight with the Tartar at first, by which it appears, that the Tartar is nearly Pure. If you mix this Salt with an equal Quantity of Salt, and Calcin'd again, you will take away the nauseous Lixiviotae of the Salt, by which it will become not only more pleasant, but also in a great measure refit the Intimination of the Air, to that it will not so easily melt or dissolve. It is Diuretic, a Famous Opener of Obstrutions, and has all the Virtues of the former pure Salt. It takes away looppages of the Lungs, Stomach, and Bowels, provokes the Terms, and is prevalent against Athanas's, Coughs, Colds, Consump'tions, Pleuritics, Cachexies, Droopis, Jaundice, &c. Dose from half a Dram to a Dram, in Ale, Beer, Broth, Wine, &c. See our Pharm. Condiments, lib. 3, cap. 11. feil. 59. And our Pharm. Batacon, lib. 1. cap. 10. feil. 42.

LXII. Oleum Tartari per deliquium : Oil of Tartar by Distillation. Put pure Salt of Tartar upon a Polipe Marble, which place flowing in a Cellar, over an Earthen Glass'd Pot or Fun, or broad Glass Pefl, in a muffl Cellar, so will the Salt difolve into an Oil, and fall down into the Receiver. Or put it into a Hippococca Bag, which hang up in a muffl Cellar, with a Glass, or Earthen Glass'd Receiver under it, to receive the dropping Oil, which filter and evaporate to a Conflitution, But if you would have immediately Oil of Tartar per deliquium, then put one Ounce of pure fine white Salt of Tartar, into 100 Ounces of Water, and it will all dissolve into Liquor, which if you pleafe, you may filter thro' Bronze Paper, and keep for use. It has all the Virtues of the Salt, and may be given from half a Dram to a Dram, in any proper Liquor.

LXIII. Sal Tartari Folliatum : Folliated Salt of Tartar. Take Pure Salt of Tartar as much as you pleafe.
Larger and more numerous, gathering together not much unlike a Bunch of Grapes, and not the Fire exceed in heat such as is commonly used for Fermentations, still burning in more Powder of Crude Tartar, not too much at a time, till the Fluidation should run over the files of the Filter. If you see the Evaporation ceases, you may cease to stir in any more Powder of Tartar. Put this whole matter into a very large Iron Pot, with a very long Neck, which cover with its Head and Receiver. Last week the Funnelers, and Distill in a Sand heat, with a very gentle fire, (applying continually cold water on the Head, to keep a little the boiling of the matter) at last augment the fire, so will the Volatile Salt ascend. The Distilled Liquor retails again, as much as is fit for the Separation of the Salt, which will be here in White sift and Perfury. This Evaporation is made by the aid of the Fermentation, made by mixing of Crude Tartar with the fixed Salt of Tartar, whereby a perfect Separation of the Salt is made, (as well from the Cilex as Crude parts) and to Volatiliz'd, that after Diffusion there is not to be found in the Feces any Salt at all, either Volatile or Fixed. But there is another Operation, which is this Volatile Salt of Tartar, from the pure fixed Salt thus: Take pure fine Salt of Tartar 3 Pounds, of the black distilled Oil of Tartar a Pound, mix them well together, and put them into a large Bottle, which stop very close, and place it in a gentle Sand heat for 6 Months, then open the Bottle, and mix thereto a large Receiver well Luted, and place it in a Sand heat. Distill with a great Deal Fire, so will a great Quantity of Volatile Salt come forth, swelling like urine, but white and Crystaline, of a very penetrating Smell, with a Liquor afo, which contains in it a small Quantity of the same Salt and a little Oil, almost as penetrating as the white Crystaline Salt. In this Preparation, by reason of the long Digestion, there is a secret Fermentation between the Distilled Oil and the Fixed Salt, and both the said Oil contains much Volatile Salt, yet the Volatile Salt here ascending, proceeds chiefly from the fixed Salt of Tartar, and is fit, which in this Operation quitting its Gaine, immediately becomes Volatile, and manifests it self with all the Properties and Qualities of a Volatile Salt. The reason is, that the fixed Salt of Tartar here ascending, is in a very great Quantity, and much more than the weight of the Oil; and the Feces remaining (which are only a black Oily Coal) weigh very much less than the Volatile Salt which is made use of. The Virtues, Uses and Doles of this Volatile Salt, prepared by either of these ways, are fully and exactly the same, with Volatile Salt extracted from the Lees of Wine, at Self Lill, afo foregoing.

LXVII. Liquor of Tartar. Take Calcin'd Tartar, and Common Salt, of each a Pound, fair Water 2 Quarts, mix, and digest in a gentle Sand heat for a Week, stirring it every day, strain, and add thereunto pure White Tartar in fine Powder, a Pound; digest in a moderate Sand heat for a Month, then strain out there a hippocrepis Bag, and afterwards stir the strained out Liquor there a brown Paper, and keep it for use. It will gently purge the Belly of Vomit and Watery Hypersalivation; and from one Spoonful to two, (more or less) in Blood, Gruel, or Rheum of Wine and Mead. It exceedingly opens all Obstructions of Liver, Spleen, McLeine, Knees and Worm, provides Urine, and cleanses the Urinary parts; is good against Melancholy, the Scoury, Dropsie, Jaundice, Gout, Obstructions of the Terms, Vapors and Giddiness of the Head, Green Sickness, &c.

Chap. DCCXV.

Of Violets

Garden and Wild.

I. THE Name. It is called in Arabic, Sr
megge, Sornefge, and Benefigel: in Greek, 
ελης, in Latin, Viol, and in English Violet.

II. The Kinds. We have first, 
νάξιον, Viol Parvula DEFOTOAON: its 
flowers, vel small, Viol nigra THEOPHRAST: 
Viol Hortensis, and Viol 
la Matrina, Viol parvula, Garden or March Vio-

lets. 2. Viol Matrina vel purpurea flore Multi-
pliato, Double March Violets. 3. Viol suruella 
parvula, Viol Arborcororis Matthioli, Viol 
la Matrina, Viol purpurata, Garden or March Vio-

lets. 4. Viol Matrina vel purpurea flore Multi-
pliato, Double March Violets. 5. Viol suruella 
parvula, Viol Arborcororis Matthioli, Viol 
la Matrina, Viol purpurata, Garden or March Vio-

lets. 6. Viol Matrina vel purpurea flore Multi-
pliato, Double March Violets. 7. Viol suruella 
parvula, Viol Arborcororis Matthioli, Viol 
la Matrina, Viol purpurata, Garden or March Vio-

lets.
Violet Wild Common.

which have the Smell of the Garden Kind, but much weaker, and some of them have almost no Smell at all. Of the Wild Kind, there is the Purple sort, and the whitish white. I am apt to believe, that the Garden kind is only this Wild kind Transplanted into Gardens, where having a better Soil to grow in, it becomes more perfell in its Color and Smell.

VI. The fourth, or Upright Wild Violet. is not confifts of Strings, which abide not after March gone, but prefers six Species by Seeming it fell every Year. It grows to be about a Foot high or more, with hard upright Stalks, which yet bend down again their tops, having two Leaves somewhat round, set at each Joint, but longer, and more divided about the edges than those of the Garden kind; at which Joints, with the Leaves on both sides of the Stalks, comes forth a larger Flower, and more spread open than that, being more like a Hearts-eafe, or Panley, but of a pale purplish color, which as Matthiolus says, is almost as sweet as the Garden Violet; but as Lobel says, is without any Smell at all. After the Flowers are puffed, follow the Seed Vessels, (which are longer than those either of Violets or Hearts-eafe) in which is contained as small Seed as that of Hearts-eafe, but white.

VII. The fifth, or Wild Jagged Violet, or Carollinaan Violet. It has a spreading shrews Root, and rise up with Stalks about a Foot or more high, but so weak as that they can scarcely keep themselves upright, but bend towards the Ground, unless they have some Strakes, Bights, or other matter to lean against. There first Spring from the Root several Leaves, upon a pretty long Footstalk, which are long, and cut in on the edges on both sides, in several Divisions, which Some will have to re-

ssemble the longer sort of Crowfoot Leaves, either an Amomum Leaf, but those which I first and gather with my own Hands, are jagged, and border more like a Venetian Leaf, for shining side the color. Between these Leaves rise up several small Stalks, with the Leaves, but longer upon them, which grow lower and lower up to their tops, which have Flowers upon them, of a pale Purple color, very like in form to our common Garden kinds, but not so deep flushed, but some of them of a pale Purple, and some of a whitish yellow, and some of these last with a little reddishness towards the bottom of their Leaves; some of these Flowers had a very faint or Languid Smell of our common Garden Violets, and others had no Smell at all: The Stalks bore also round Heads or Seed Vessels, (which contained the Seed) like to the Seed Vessels of Violets.

VIII. The Flowers. The first and second grow in Gardens; the third Wild in Field and Hedges, under Hedge Sides; the fourth grows wild in warm Climates, as Spain, Italy, Greece, Asia, &c. but with us in Gardens; the fifth grows Wild in several parts of America. I found it particularly in South Carolina, in the Woods not far from Charity Town.

IX. The Times. They all Flower in March, and if the Season is mild, sometimes earlier. The Double Violets Flower later than the Single, and hold their Flowers longer; and some of them have been observed to Flower again in Autumn, if the Weather be temperate and mild.

X. Observat. The Culture of the Single Garden Violets, is what every body knows, which delight in Earthly places, and Stock as are most exposed to the Sun. The Double Violets grows in any Sort of Ground, upon the edges of Borders in Gardens, when it blooms, its Flower is very agreeable to both Eye and Smell: To make it thrive, it ought to be Replanted every three Years, and to keep clear from Weeds, which is all the trouble it requires.

XI. The Qualities. Garden Violets while fresh and green, are cold and moist in the first degree, Aperient, and gently Alitrefive, or opening the Bowels by Purging.

XII. The Specification. Violets cool the heat of Fevers, allay Inflammations in the Throat and Lungs, are proventible in the beginning of a Quinte and Pleurisy, and are said to help the Falling-Sickness in Children.

The Virtues.

XIV. The Virtues. 1. Of the Leaves. It cools any heat or diffemperature of the Body, whether inward or outward; shares Inflammations in the Eyes, alfo in the Womb, and in the Fundament, by being used as a Topick. And being drank to 2, 3, or 4 Ounces, it gently opens and purges the Bowels, and is good against Quinsies and Pleurises.

2. Juice of the flowers. It has the former Virtues, and is good against the Pleurisy and Obstructions of the Lungs, hot and sharp Rheums, hourneys and wheezing.

S 2 XV. The
Salmon's Herbal.  

LIB. I.

Of VIOLETS. Corn and Dames.

I. T H E N A M E S . Tho' these are properly no Violers, nor in the leaf of kin to them, yet since Cuthon has obtained that they should be so called, we were obliged to rank them in order in the Alphabet, and in this place where you now find them. The fifth I suppose was unknown to the Ancient Greeks and Latins, and therefore we have no Greek, or ancient Latin Name for them. This fift is called in Latine, Viola arvenfis, Viola Segetum major, Viola Segetum minor, Ombrefcia & Compmula arvenfis Lugumufi, the greater Corn Violet. 2. Viola arvensis minor, Viola Segetum minor, the leffer Corn Violet. 3. Of the second or Dames-Violet, we have 1. Hesperis vulgaris, free Viola Matronalis commune, Viola Hyemalis, Damascena & Muscibelli; in English, Common Single Flowered Dames-Violets, Queens Ginflower, and Winter Ginflower. 2. Hesperis Pannonicia, Viola Matronalis Pannonica; Hungarian Dames Violet. 3. Hesperis, free Viola Matronalis flore albo pleno, Viola alba Tragi, Perfora Hyemalis, supposed to be the Lucanism Finger, Viola Matronalis flore pleno Domeni & Lugumufi, Viola Damascena flore pleno Lobelfi, Viola Hyemalis flore albo pleno, Viola Hyemalis flore albo pleno, White double Dames Violets, 4. Hesperis flore pleno Purpurante, Viola Matronalis flore pleno Purpurante, Double Purple Dames Violets.

The Descriptions.

First, Of the COrn-VIOLETS.

IV. The fift, or Viola Segetum major, Viola pentagonia major, Speculum Veneris major, The Greater Corn Violet. Its Root is small, fibrous and Annual, which sends forth several fnder, weak, trailing Stalks lying on the Ground, divided and subdivided from every Joint into Branches, so plentifully, that one Plant growing in a good Garden, would hardly be covered by a Half Boid Half Measure: the Branches are thick yet without or- der, with small and somewhat long Leaves, slightly dent'd, or rather waved on the edges; at every Leaf from the middle of the Stalk up- wards, comes forth a fower, of the bignefs of a Two-Pence, fo (that four hundred Flowers, almost, will be seen open at once, which is indeed a Noble Sight.)
Violet Corn Greater.

bottom, with a white Pointed in the middle, closing up every Night, and opening in the Day time only, the Seed is small and yellow, and contained in small long Heads.

V. The second, or Viola Septem minor, Speculum Venetum minor, Codded or small Corn Violet. Its Root is small and Annual, also not much unlike the former, which tends up Stalks more upright, like unto the little Cantory, with stiffer and fewer Branches, more burtb or rough also in handling. The Leaves are like unto the former, but something less. At every Joint almost, come forth two or three Flowers, standing at the ends of long Stems, like unto Lysimachia Silicopila, of the same fashion and color as the former, but so small as the Eye of a little Bird, never rising above the Head it stands in, and not but in the best of the day to be seen, unless then only lets it self open. The Seed is small and yellow also as the former.

VI. The Places. It first grows in Corn-fields, between Greenfield and Dartford in Kent, as also in the Corn-fields about Liffy, a Town in the furthermost parts of Hartsfordshire, towards Bedford, and for its pleasant Aspec, is also brought into, and Planted in Gardens. This second is found about Hatfield, in Hartsfordshire, and in several other places of this Land. Parkin for says, it is much more frequent than the other.

VII. The Time. They both Flower in June and July, even to the end of August, the Seed ripening in the mean time.

Secondly, Of the DAMES-VIOLETS.

VIII. The first, or Common Single Flowered Dames Violet. Its Root is wholly composed of Strings or Fibres, which alike many Years, sending up fresh Stalks every Year, the Leaves shedding all the Winter. Its Leaves are broader, greener, and sharper pointed than the Stock Gilliflowers, and a little indented about the edges. The Stalks grow to the about two Feet high, bearing many green Leaves upon them, smaller than those at the bottom, and branched at the top, bearing many Flowers, in fashion much like to those of Stock Gilliflowers, consisting of four Leaves in like manner, but not so large, of a faint purplish color in face, and in others white, having a pretty Scent, Smell, especially towards Night, (whence came as it is supposed, the Name Heptalis,) but in the Day time little or none at all. After the Flowers are past, come small, long, and round Pods, in which are contained two rows of small and long black Seed.

IX. The second, or Hungarian Dames Violets. Its Root is Fibrous, and its Leaves very like the former, but smoother and thicker, and not at all cut in or indented about the edges. The Flowers are like the former also, but of a dull pale color, turning themselves, and seldom bring plain open, having many Purple Veins and Streaks, running thro' the Leaves of the Flowers, of little or no Smell in the Day time, but of a very sweet Scent in the Evening and Morning. The Seed is like also, but a little browner.

X. The third, or Double White Dames Violets. It grows not so great in any part thereof, nor so high as the Single does, except in the Flowers, which
Salmon's Herbal. Lib. 1.

which being very thick of Leaves, of a pure white color, and many standing in a Cluster, sweeter also than the Garden Single Kind, and longerish, closer, is to be had in some gardens. Its Leaves are something longer, and of a fresher green color, little or nothing fáiltful about the edges, and more tender, but its branches are more plentiful, and more easily to be Planted again, than those of the Single Kind, but grow no Seed, as many other Double Flower'd Plants do in like manner. It is also more tender to be kept in Winter time than the Single Kind.

X. The fourth, or Double Purple Dames Violets. These differ little or nothing from the former, saving in the color of the Flowers, which in this is of a pure pale Purlple color, and not past out so double as they, nor so many clustering together.

XII. The Places. They all grow in Gardens for Ornament like in a great measure, and the two Double Kinds in many Gardens in the West parts of England.

XIII. The Times. They all Flower in May, June, and July chiefly, and the White Double abides longest in Flower, if it grows not too much in the Sun.

XIV. As to the Qualities, Specification, Preparations and Virtues of these Cow and Dandy Vipers, there are totally different, nor have we learnt anything of them by Experience: yet we did not think it fit that they should want a place in this Our Herbal, since the most General Plants, and all Lowers of Flowers, for their Beauty sake, allow them a room in their Gardens.

CHAP. DCCXXVII.

Of Vipers Grafs.

I. THE Names. It has no Arabic nor Greek Names that we know of, nor any Ancient Latin Name, being a Plant of modern Invention, and therefore is called by our modern Physicains, Serpentaria, Viperaura, Viperis, (from its Virtues in curing the Biting of that Serpent) and Scorzonera, (from the Spaniards, being equivalent to Viperaura) and in English Vipers Grafs, and also Scrozoners.

II. The Kinds. Author make 7, 8 or 9 kinds, but most of them being perfect Strangers to us, and not to be seen in England in Ages, we shall only discourse here of such as are Planted and Nurs'd up in our Gardens, which are the four following, viz. 1. Scrozonera, feu Viperaura, Hispanica major, The Greater Spanish Vipers Grafs, 2. Scrozonera minor Punonisca purpurea, Hungarian Purple Flower'd Vipers Grafs, 3. Scrozonera major Punonisca latifolia, The Greater Hungarian broad Leaved Vipers Grafs, 4. Scrozonera minor radice tuberofa Hispanica, The small Spanish Vipers Grafs with a Tuberofe Root.

The Description.

III. The first, or Greater Spanish Vipers Grafs. Its Root is long, thick and round, brittle and black, with a certain root like在家 on the outside, but very white within, yielding when broken, a Milky Li-
Chap. 727. English Herbs. 1239

The Virtues.

XII. The Boiled, Roasted, or Baked Roots. They are sweet in taste, almost like a Partake, and may be eaten in the same manner, without doubt they cheer the Heart, strengthen the Animal Spirit, and relieve in Consumptions.

XIII. The Liquid Juice. According to Monsard, it is a good Cordial and Counter-Poison, and does not, or can cure the Biting of the Vipers, but of any other Poisonous Creatures; it is good

against Burning and Contagious Fevers, and induces Sweating, thereby expelling thro' the Pores, Pestilential Infection. It is good against Pains and Tremblings of the Heart, Hypochondriac Melancholy, and Swooning Fits. It opens Obstructions of Liver, Spleen, Miferer and Womb, provokes the Converse, is good against Hypertick Fits, and other Disturbances of the Womb, and revives against the Head-ache, Vertigo, and other Distresses of the Head and Brain, strengthening after an admirable manner, the Animal and Vital Powers. This Juice may be taken not only from the Roots, but also from the Leaves and the whole Plant.

XIV. The Ophthalamic, Tincture of the Clarified Juice a Foot, Clarified Honey two Ounces, mix and mix together. Dropped into the eyes, it is good against Inflammation and Blood-shot, takes away Clouds, Spots and Blemishes in them, and heals them if Sore or Ulcerated, strengthening the Sight withal.

XV. The Condited or Preferred Root. They are pleasant to be eaten as a Sweet Meat, not inferior to Fering Roots, and may have in some small measure the Virtues of the Liquid Juice.

XVI. The Distilled Water. Authors ascribe the Virtues of the Liquid Juice, but I am confident it is nothing so strong or effectual, but they give it against hot, burning and malign Levers, and the Infection of the Plague, and all sorts of Contagious, Inebriate and Pestilential Distresses, Paintings, Swoonings, and other Palfins of the Heart.

CHAP. DCCXXVIII.

Of the VIRGINIA Creeper:

OR,

CLIMER.

I. THE Name. It is a Plant ofoyal Invention, being brought to us from Virginia, and there parts of the West-Indees, and there it grows women in fact, yielding but little Milk when it is broken, and abides the Winter almost as well as any of the former. It has divers Leaves very small and narrow, lying on the Ground, some Roots growing small Leaves, and others crumpled or scrunched about the edges. The Stalk or Stalks are very small, scarcely rising half a Foot high, bearing a long, small, feily Blosomed, with a small and single pale yellow Flower, in which grow smaller black Seeds, and enclosed in a leaf about than in any of the others.

VIII. The Places. The Native places of these Plants, are declared in their Titles or Names, but now they are made Free Denizens of our Country, and are found murr up, and growing in many of our Gardens.

X. The Specifics. They are temperate in respect of heat or cold, dryness or moisture, Cordial or Cardialick, and Aphrodisiac, and relishes of Poyon.

XII. The Preparations. 1. The Boiled, Roasted, or Baked Roots. 2. The Liquid Juice. 3. An Ophthalamic. 4. A Cordial or Preference. 5. A Distilled Water.

The Descriptions.

III. The Riff, or Hedera Quinqufolia Virginiana, Five Leaved Creeper. Its Root spreads here and there under the Ground, not very deep: It is a slender Vine, low, or Plants, till and climbing, and rises out of the Earth with several Stems, none much bigger than a Man's Thumbe, but many lefts. From whence it grows forth many long wood Branches, not able to stand upright, unless they be fastened, yet planted next a Well or high Poles, Poles, Trees or the like, the Branches at several distances from the Leaves, will grow forth small Heart Vines, not twining themselves about any thing, but ending in four, five, six, or more
Salmon's Herbal. Lib. 1.

CHAP. DCCXIX.

OF VIRGINIA Silk-Grafs.

I. THE NAMES. It is a Plant of Novel Invention, and therefore no Primary Greek or Latin Names can be given for it, but only such as have been ascribed to it by Modern Authors, by whom it is called Periploë Virginiana, and in English Virginia Silk, and Silk Grafs.

II. The KINDS. Mr. Rea gives us the Description of but one Sort, but Parkin'son of two, viz.

1. Periploë retina, and major Virginiana, The Greater Virginia Silk-Graft. 2. Periploë Virginiana minor, The Lesser Virginia Silk-Graft. Gerard will have it to be a kind of Apfeolus or Sowerns-nerve, but then he might have called it Apfeolus Larix, because this Milk has a Milky Juice, whereas the true Apfeolus has no such thing. Alpinus de Plant. Egypt. cap. 55, has a Plant called Biedelfcr, Homemor Bulsin, in T. S. 1. t. 4. 10. t. 5. 4. 17. 8. 17. has Chalmo, in the same Book another Plant, which he calls Aegypnon Syruphus, Pulvisculum & Aegyp- cium: These, some will have to be this Silk-Graft, but this they cannot be, because this Milk contains a true Vatex or Shroud, whereas this is not, but loofes its Leaves and Stalks, they dying down to the Ground every Year. Again, the Milk of those Plants is Caduciv, as Alpinus and Rea say, whereas the Milk of our Virginia Silk-Grafs is not. Alto the Cods of those of Alpinus, Bollin, and Chalmo, are nearly flat, whereas those of our Silk Grafs are crooked, almost like Hooks, and yet they grow perfectly upright.

The Descriptions.

III. Mr. Rea's Description, which I take to be of the Greater kind, is this. Virginia Silk is a Plant more resplendent for being a Stranger, than for the Beauty of its Flowers: Its Root is big, long and white, running for under Ground, and jorning up again in many places, and rises up with one or more round Stalks, almost four feet high, set at several Joints with two long, broad, wavy, round pointed green Leaves. At the top of the Stalk, out of a Spany Hilt, comes forth a great Leaf of Flowers, to the number of thirty or forty, hanging down on long Foot-stalks, each flower consisting of five small hollow Leaves, of a pale purplish color, neither fair nor pleasant. After they are pale, come long crooked Cods, bending upright, containing flat brown Seeds, wrapped within a great deal of fine soft whitish brown Silk. This I take to be Parkin'son's Greater Virginia Silk.

IV. The Sort, or Parkin'son's Greater Virginia Silk-Grafs. Its Root is long and white, of the hig- nes of a Mans thumb, running under Ground ve- ry fair, and shooting up in divers places, the Heads being set full of small white Grammes or Knots, yielding forth many Branches or Stalks, if it binds any time in a place. It rises up with one or more strong and round Stalks, 3 or 4 feet high, on which are set at the several Joints, two fair long and broad Leaves, round pointed, with many Veins therein, growing close to the Stem, without any Foot-stalk. At the tops of the Stalks, and some- times at the Joints with the Leaves, comes forth a great
Chap. 729. English Herbs.

great Bath of Flowers, out of a thin Skin, to the number of 20, sometimes of 30 or 40, every one upon a long Postdok, hanging down their Heads for the most part, especially those that are outward, each hanging within a Hat of green Leaves turned to the Stakeward, like to the Virginia Lycanthea Flower, and each of them consisteth of three small Leaves, of a pale Purplish color on the upper side and of a pale yellowish Perule underneath, both sides of each Leaf being as it were folded together, making them seem hollow and pointed, with a few short Centers in the middle: After which, come long and crooked Cods, standing upright and sharp pointed, in which are contained flat brownish Seed, disorderedly lying within a great deal of husk, left and whitish brown Silk, very like unto Cods, Seed, and Silk of Alliceps or Swallow-wort, but that the Cods are greater, more crooked, and harder also in the outward Shell. This is Beautiful a Plant, (as Parkinost calls it) even the whole Plant, Leaves and Stalks being broken, yields a pale Milk.

V. The second, or Periplaca Virginiana minor, five Aposcyrum Virginianum minus, or offer Virginia Silk-Grass. This creep not with its Roots in the Ground, like the former, but from many long Fibres shoot forth a round brown Stalk about half a Yard high, having at each Joint a pair of long narrow Leaves, and at top such a large Flag of Flowers as in the Reel, but of a deeper Purplish color, which have a certain crimsonness in them, that do retain Flies, or other little things which happen to fall thereon; after which, come long and Fair Cods, (not crowded like the Greater sort) with flat brown Seed lying therein, in a white kind of Silk or Down, like unto Alliceps or Swallow-wort: This yields a Milkly Sap or Juice like the other, which some think to be dangerous, the Experience has declared no such thing; and therefore must be left to a further Scrutiny, by Tryals hereafter to be made.

VI. The Places. They both are Natives of Virginia, and other places of the West-Indies, where they grow abundantly. They have been often raised by Seeds which have come from hence, and also from the Stalks left in the Ground each Winter, yet the Root is of long continuance, and will fend forth new at the Spring, especially if the place where it grows be covered with Horse-Dung in the Winter, to defend it from the Frosts.

VII. The Times. They Flower in July, but not every Year, and their Silk and Seeds are ripe in August, but it scarcely ever brings forth its Cods with us, by reason of the coldness of our Climate.

VIII. Observat. Gerard says, (of the larger Species) that the Cods are filled full of a most pure Silk, of a changy white color, among which Silk is the Seed. Thee Cods are not only full of Silk, but every Nerve or Sinue, wherewith the Leaves are Ribbed, are likewise most pure Silk; as also the Stalks, Stems, Salticks, or Branches, which come from them, even as Flax or Hemp from their Stalks. 'Tis admirable to think, how God has blest both Countries with a Substantial matter (which they daily tread under Foot) by which they may be both well and Huamously Cloathed, and which is sufficient to Apparel or Cloath all the Countries, if carefully Manured and Manufacured. But Parkinost says concerning it, That he knows there is another Plant growing in Virginia, called Silk-Grass, which is much differeth.

IX. As to its Qualities, Specification, Preparations and Virtues, Authors have said nothing, nor do we say anything concerning the same. The Natives make Ropes and Cods of it, but nothing else, being much stronger than either Hemp or Silk, but was it Manufacured as it might be, it would make Super fine Cloathing of all sorts, much exceeding any thing made of Flax, Hemp, or Cotton, and possibly much inferior (if any thing at all) to what is made of the Linen and Belt Silk.

VIRGINIA BOWER, see Ladies Bower, Chap. 420.

CHAP. DCCXXX.

OF WAKE-ROBIN:

or,

Cuckow-Point.

I. THE Name. It is called in Arabick *

and Sarsi, in Greek * and in Latin *

Arum: some call it Pero Pilita, from the Form of its Leaf, and some from the Figure of its Pede, in the middle of the Hold, call it Sacritaria Fruits, and Canis Prisop: some call it Dagonetia minor, and Sarptosteria minor, but we in English call it Wake-Robin and Cuckow-Point, or Sturch-Worts.

II. The Kinds. There are many Species of it, but only two which are frequent with us, viz. 1. Arum vulgare non Maculatum, Our common Wake-Robin without Spots. 2. Arum vulgare Maculatum, Our Common Spotted Wake-Robin. Some will have Araurus, or Friers-Cools, to be a kind of Wake-Robin, and call it Hooded Wake-Robin, but of this we have already treated in its proper place.

The Descriptions.

III. The first, or Common Wake-Robin without Spots. Its Root is Tuberos, and about the big- nes of a Walnut Green and all, if it grows in good Ground, is brown within, and white within, very Succulent, with some Fibrous additions to it. If chowed between the Teeth, it has a vehement Heat, and Burning Sharpness with it, almost beyond expression, so that if a bit of it, not so big as a small Bean, should be Chewed in the Mouth but for a Minute, it would so inflame the MOUTH, Tongue and Throat, that probably the Inflammation would scarcely be alleged in 24 Hours; and I have known some who out of Wantonness, have Chewed it, who have, by reason of its Violence been in danger of their Lives, nor in more than a Weeks time could recover themselves: And this is manifest by daily Experience, that the dried Root (be it as hot as Pepper) is void of all these Dangerous Accidents. Its Juice, or any Powder, has a very Strange Commixture with all other Linen or any other thing on which it is laid, no left them Starchy, and in former days, when the 7
Salmons Herbal. Lib. 1.

Wake-Robin not Spotted; Or Greater.

and long, broad at the bottom near the stalk, and forked like unto a Wild Sorrel Leaf, but ending in a Point, without Dent or Cut on the edge, of a fatal green color, each standing upon a thick round stalk, of an Hand Breadth or more. Among which, (after they have been up two or three Months, and begin to settle,) rises up a bare Naked round white green stalk, something spotted and barked with Purple, like the Stalk of Dragons, which grows somewhat higher than the leaves; at the upper whereof stands a long hollow Hops or Husk, close at the bottom, but open from the middle upwards, ending in a Point: In the middle of which, grows a small long Felle or Pointel, smaller at the bottom than at the top, of a dark Purples color, as the Hops or Husk is on the inside, the green without, which after it has so remained for some time, the Hops or Husk decays with its Felle, and the end or bottom thereof grows to be a small long Bunche of Berries, green at the first, and each of them when they are ripe, of a yellowish red color, of the beauteous of a Hulse-

Wake-Robin Spotted, or lesser.

The Nut Kernel, which abides thereon almost till Winter. In the time when this Plant bears its Berries, its Root (which is Tuberos and somewhat long, not growing down right, but for the most part lying along; its Leaves growing forth as its bigger end,) is somewhat flourished and

To the

1. The
IV. The Black, or Spotted Wake-Robin. This in its Root, Stalks, Leaves, Col. Fruit and manner of growing, differs nothing from the former, only that both Roots and Leaves are more violently fibrous, and the Leaf or Leaves more tough and biting, and somewhat harder in feeling, sharper pointed, and have some blackish Spots thereon, like the Spotted Agrimont, which is the most part, aside in the Summer longer green than those of the Red do.

VI. The Times. The Leaves appear presently after Winter, early in the Spring, and continue but to the middle of Summer, or some small time longer. The Pelle flows it fell out of its Hose or Husk in June, appearing before the Leaves fall away, whilst they are yet in Withering; and when they are gone, the Bunch or Cluster of Berries, viz. its Fruit, becomes ripe towards the end of July, or in August.

VII. The Qualities. It is hot and dry in the fourth degree, Aperitive, Alleviative, Diuretich and Laxative, Cold, and Hydropic, Anti-athmatick, Emmenogogick, and Alexipharmick.

VIII. The Specification. It is prevalent against Afflicts, Coughs, Colds, Obstructions of Lungs, Lachrymation, Mouths and Wounds, provokes the Vomits and After-birth, is good against Diffary and Strangury, gives ease in the Piles, and is a potent remedy against the Plague, Pestilence, and Poxen.

The Virtues.

X. The Green Leaves. Being bruised and laid upon any place pained with Sciatica or Gout, it draweth out the Morbid matter, and eases the pain: And applied to the Bitings of Mad Dogs, Vipers, or Plague Snakes, it draweth out the Poison and Malignity, and secretes the Patient from Danger.

XI. The Juice of the Herb or Berries. Taken to the quantity of a Spoonfull in any fit Vehicle, it provokes against all Poison and Plague, and if a little Vinagier or Juice of Limes be added to it, it somewhat allays the sharp biting Taffe thereof.

The Juice of the Berries given in White Wine, provokes the Vomits in Women, provokes Urine, and provokes against Diffary and Strangury, brings away the After-birth, and cleanseth particularly after Child bearing; and taken with Sheeps Milk, it healeth inflammate Ulcers of the Bowels.

XII. The Juice of the Root. It has all the Virtues of the Leaf of the Herb, but is much stronger, and therefore must be given with Caution, mixt with some other proper Vehicle, it cleanseth all manner oforton fibrous Ulcers in what part of the Body fovere, and heals the flaming Ulcers in the Nobs, callfed Occans, and the Palseies.

XIII. The Decotion of the Herb, Root or Berries, in Water. It has all the Virtues of the Juices, but very much stronger, it may be taken to half a Pint at a time. Drops into the Eye, it cleanseth them from any Film or Skim, Clouds, Milfs, or other things which obstruct the Sight, it is good against an inflammation of the Eye, helps their watering and redness, and when he chance they become black and blue.

XIV. The Milk. It is made by boiling the Root therein: It has all the Virtues of Juice and Decotion, and is good to heal internal Ulcers, 3. or 4 Spoonfulls or more.

XV. The Powder of Roots, Berries or Leautes. Taken to a Dram, it is a most perfect and certain remedy against the Plague, Poison, and the bites of Serpents or Mad Dogs: The same taken mixed with Clarified Honey, or Sugar, (in form of an Eleedary) is admirably good against Afflicts, Coughs, Colds, Hoarfrost, Wheezing, and hoarse-

Of WALL-FLOWERS

Single and Double.

I. The Names. This Plant is called by the Arabians Keiri, or Cheeri: in Greek, Anaxia argentea; in Latin, Leucium Luteum; and in English Wall-Fower.

III. Of the Double kind, we have, 1. Keiri, five, Leucium Luteum flores plenos vulgaris, Our Common Double Wall-Flower. 2. Keiri, five, Leucium Luteum flores plenos alterius, Pale Double Wall-Flower. 3. Keiri, five, Leucium Luteum majus flores plenos, Sanguinea, The Double Wall-Flower.
Salmon's Herbal. Lib. I

The Descriptions.

IV. The first, or our Common Single Wall-Flower. Its Root is white, hard, and flourous, has several small, narrow, long, and dark green Leaves, set without order, upon round, robustish woody Stalks,

Wall-Flower Single, Common.

which bear at the tops many Single yellow Flowers one above another, each of them having four Leaves apiece, and a very sweet Smell: After which, come long Pods, containing reddish Seed.

V. The second, or Great Single Wall-Flower. Its Root is like the former, and will perish in Winter, if not defended from hard Frost. Its Leaves as well as Flowers, are much larger than the former. The Leaves are of a duller, and of a shiner green color, and the Flowers of a very deep Gold yellow color, and commonly as broad as a Half Crown piece of Silver. The Spike or top of Flowers is also much longer, and it abides much longer in flowering, and is much flowerer in its Scent or Smell. The Pods for Seed are thicker and shorter, with a small point at the end. This Plant is flower in spreading at self out into Branches, and more tender to be preserved, and is increased by Planting its Branches, being slips off.

VI. The third, or White Single Wall-Flower. It has a Root like the former, and its Leaves are as green as the Great kind, but nothing so large. The Flowers stand at the top, but not in so long a Spike, but rather in a Tost, and each Flower is composed of 4 Leaves, of a white color, not much larger than the Common Kind, but of a weaker Smell. The Pods are not so great as those of the former greater one. This is more easy to be propagated or increased, but requires some care in defending it from the Cold of Winter.

Wall-Flower Single, Great.

Belonging to Sect. V.

Wall-Flower Double Common.

VII. The first of the Double Kind, or Our Common Double Wall-Flower. This in its Roots, Leaves and Stalks, are very like unto the first.
Chap. 731. English Herbs.

1245

Single Kind, stating that the Leaves hereof are not of so deep a green color. The Flowers stand at the top of the Stalks, one above another, as it were a Spike, which Flower by degrees, the lowest first, and so upwards, by which means it is a long time in flowering, the Flowers being very Double, of a Gold yellow color, and very sweet.

VIII. The second, or Pale Double Wall-Flower. Its Flowers in this kind not Spike Fashion as the former, but more open spread, and do all of them blow open all at one time, and not by degrees as the others do. They are of a paler yellow color, and differ in nothing else, being that the green Leaves hereof are also of a paler green.

IX. The third, or Double reddish yellow Wall-Flower. Its Leaves are green, and almost as large as the Great Single Yellow kind, or fall as big as the Leaves of the White Wall-Flower. The Flowers are not much larger than the ordinary, but are of a darker yellow color than the Great Single kind, and of a more brownish or red color on the underfides of the Leaves, being as it were stripp'd.

X. The fourth, or Greatly Double-yellow Wall-Flower. Its Leaves are green as and a large, if larger than the Great Single kind. The Flowers are also of the same deep Gold yellow color, but much larger than any of the former Double kinds, and as sweet in flavoring to, as of those.

XI. The Places. The first grows upon old Stone and Brick-Walls, and sides of very old Stone-Buildings, in many places through the whole Kingdom, but has of late been brought into, and Planted in Gardens, where the other fix kinds are also kept and nurtur'd.

XII. The Times. All the Single Kinds do flower often in the end of Autumn, and if the Winter is mild, all the Winter long, but especially in the Months of February, March and April, even till the heat of the Spring stops them. The Double Kinds Flower sometimes very early, and sometimes very late in the Year, but do not continue flowering in that manner the Year throughout.

OBSERVATIONS.

XIII. 1. As to the Single Flowers. Their Seed should be Sown in September, in the Earth just as you find it, without any previous Preparation; for it is the Nature of this Flower to grow upon Walls, and even amongst Rubbish.

XIV. 2. When they are Cultivated, more Cargo is to be taken of them, that they may serve as Ornaments in a Garden, for Borders of Bolls and Places, where they look very agreeable.

XV. 3. Having managed them as do Flowers for Transplantation, as soon as you think them strong enough to change their places, put them in one that agrees with them, and Water them daily, to facilitate their taking Root.

XVI. 4. Be also very mindful to clear them of Weeds in this, as well as the Double Flower, being Vivacious Plants, they will then grow to your satisfaction; the rest of their Culture is to be done as in the Double Flowers.

XVII. 5. If you want the Double Flowers you must be more careful, and it is to be multiplied by Layers, or by Slips: If by Layers, chase the root, and lay them in the Earth, and that they may not rise too fast, drive a Hook down upon them, and let the Earth upon your Layers, be at the same Ground in which they are laid.

XVIII. 6. Then Water them daily, that they may the better take Root, and sooner fill up themselves in the Earth, and let them be laid as soon as they have left their Flowers, viz. in the end of May, or beginning of June, and leave them till September or October, at which time take them up, and put them either in Open Ground, or in Pots.

XIX. 7. If you place them in Borders of Pots, &c. the Garden Earth will do well enough; but in Pots, take two thirds of Sifted Kitchen-Garden Earth, and one third of Mould, with which (being mixed) fill your Pots, putting your Layers into it according to Art.

XX. 8. And since those Flowers are apt to be injured by Cold, you must House your Pots in time, left the Earth should freeze and break your Pots, and so hurt your Plants; But as for those in the Open Grounds, you have no further care to take of them, for they will always bear the Weather.

XXI. 9. If you multiply them by Slips, let them not be kept dry, that they may be Nourished so as to extend their Fibrous Roots, and about to attract the nourishing Sap, or Juice of the Earth.

XXII. 10. Let your Slips be well choos'd, and put into Pots or Pans filled with Sifted Garden-Earth, with some Mould thinly spread upon it, in to which let your Slips half their length, put the Earth gently down upon them with your hand, to help to fill them the former. Water them, and put them in a shady place till they begin to spring, after which, remove them into the Sun.

XXIII. 11. Let them be Planted at the same time you do the Layers, and when they have taken good Root, let them be Transplanted into the places you design for them, not forgetting to Water and Weed them, as often as occasion requires it.

XXIV. The Qualities. They are hot and dry in the fixt degree, Amblerive, Refervative, Valumary, of thin parts, Neurotic, Hyllewick, and Enmensagogick.

XXV. The Specification. They heal Wounds, provoke the Terms, expel the Dead Child, and are good against Agues, Apoplexies and Palies.

The Virtues.

XXVII. The Juice from the Heads of Flowers. It provokes the Terms in Women, expels the Dead Child, and forces away the After-birth; it opens Obstructions of Liver, Splen and Reins; cleanses the Stomach, Bowels and Worms, and is good against Vapors, Paralytick and Apoplexick Fits. Dose 3 or 4 Spoonfuls in Wine, or the Distill'd Water, or other fit Vehicle; mixt with Spirit of Wine, it cleanses Wounds and Ulcers, and heals them.

XXVIII. The Decotion of the Heads of Flowers in Wine. If it be made strong, it has all the former Virtues of the Juice, and therefore ought not to be taken of Women with Child, for fear of cutting Mid-Carriage. Dose half a Pint at a time. If strengthed the whole Body, or any Member of it grown
Salmos's Herbal. Lib. I.

1246

Salmon's Herbal. Lib. I.

grown looie and weak, by raisin of Paralytick and Convulsive Diftemper.

XXX. The Decoction of the Roots in Vinegar.
Being taken inwardly in the Diluted Water, and also outwardly applied, it fortifies the inwards of the Liver, Spleen, Melentery, and Womb.

XXX. The Gargarsion. Take of the Juice 6 Ounces, of the Diluted Water 3 Ounces, Root-Album 3 Drams, Spirit of Wine 1 Ounce and half, Honey 2 Drams, mix and dilute it. It cleanses and heals Ulcers and Sores of the Mouth, Gums and Throat, and other parts of the Body, the parts being daily Gargarized or waffled therewith warm.

XXXI. The Diluted Water. Take of the Juice 4 Ounces, Spirit of Wine or Brandy, 2 Ounces, Honey an Ounce and half, strong Tincture of Alces Succurina, half an Ounce, mix and dilute. Drop into the Eyes it cleanses them from Clouds, Milfs, and other things which obfuscate the Sight; heals Sores and Ulcers in the Eyes, strengthens them, and stops a Flux of Rheum falling into them.

XXXII. The Powder of the Seed. It may be given to a Dram in any proper Vehicle. It has all the Virtues of the Juice and Decoction, and may be used Morning and Night, as long as need requires. It has been given with Success against the Rickets in Children.

XXXIII. The Oil of the Flowers. It is Diffusive and Apodynt, gives cafe in pains of the Face, Reins, Joints, Nerves, &c. and is a very good thing against the Gout.

XXXIV. The Bath. It is made of the whole Plant when in Flower, boil'd in fair Water with a proper quantity of Genus Soup. It is good for Women to Sit in, who have a Loppage of their Cercys, or are not well cleansed after Deliv'ry, because it induces the Terms, and cleanses the Womb of partur Stomas.

XXXV. The Cataplasm. It is made of the Heads of Flowers beaten in a Mortar, adding some Salt. Round hard on the Wrists, it is used as a Remedy to cure Agues. But it is made by boiling the same in Vinegar with the addition of Barley Flowers, and then appliy'd warm to places pained with the Gout, it gives case in the pain, diffuses the Tumor, eases the Diffuse, and admirably strengthens the Parts.

XXXVI. The Diluted Water from the Heads of Flowers. It has the Virtues of the Juice and Decoction, but nothing near to officianio's mixeth with a quarter part of Spirit of Wine, and dilut'd with white Sugar, it is laid to cleanse the Blood, comfort the inward part, cafe pain, and cause Clearness.

XXXVII. The Confluent of the Flowers. It is given to the quantity of a large Chechut or Wallnut, Morning, Noon and Night, against Convulsive and Paralytick Diftempers, and Weakness of the Melentery, Womb, and other Bowels.

Succory Wartwort.

Belonging to Chap. 674, Sect. 5.

Of WHEAT, Buck and Cow.

I. THE Names. The first of these is generally taken to be the Komos Thipeflahi, which Gana Translates Trinum, but some put a difference between this Eryxism and the other, calling this Eryxism Cereale. It is also called in Greek by some Tegywrus, in Latin Fagurrium, and by Matthew and Lucas Habin, Fronmentum Saracenticum: Dodinens calls it Fagoypyrum, Togoypyrum and Tragancticum: Trogzos calls it Oyznum Veterus, but Caffow and Tahanamontius, Oyznum Cereale, and in English Buck-Wheat.

II. The Kinds. This Plant is Singularis sui Generis, and therefore not being manifold, can admit but of one Denomination.

The Descriptions.

III. The Root of Buck-Wheat is small and thready, and rises up with several round, hollow, brittle, reddish Stalks, a yard or more high, set with divers Leaves, each by it self on a Foot-stalk, which is broad and round, and bifurcated at the bottom, small and pointed at the end, somewhat resembling an Ivy-Leaf, but softer in handling. At the tops of the Stalks some forth several Clusters of small White Flowers, which turn into small Triangular blackish Seed, (serving to the same use of other Estable Grains) not much unlike.

WALL-FENNY-WORT, for Navel-wort, Cr. WALL-RIF, see Maiden-Hair White, Chap. WALL-TURNSOLE, see Tomfole, Chap. 717. (Sect. 5.) WALL-WORT, see Sucory Buffard, Chap. 674.

The Catt of the following Plant was exalted in that its proper place, and therefore so thought good to place it here, rather than to leave it out.
Wheat Buck.

which is spread out into many Arms or Branches, on which do grow smooth and soft Leaves, in shape like to Ivy-Leaves, or one of the Bindweed's,
or not much unlike to Ball, (advance Tabernarianum's Name of Oenoma Cereale). The Flowers are small, white, and clustered together in one or more Tafts or Umbels, tightly shut over here and there with a light Carnation color. The Seed is of a dark blackish color, and Triangular, like the Seed of Black Rindweed, which is used (in places where it grows plentifully) in times of Scarcity to make Bread of, or to be mixed with other Cereals for that purpose.

V. The Places. It is thought to be first brought out of Africa, but now is generally Sown in most of our Northern Countries, where for the Life and Profit is made of it, whole Fields are Sown therewith. It prospers well in any Ground, be it never so dry or barren, and is many times Sown, to serve as it were instead of a Dunging. It quickly comes up, and is soon ripe, and is very common about Nuremberg in Champagne, where they Sow it as well for Food for their Cattle and Poultry, as for the Use of making Bread afterward. It grows likewise in Lancashire, and in some of the Southern parts of England, in Essex, Kent and Middlesex.

VI. The Times. It is Sown in April, and beginning of May, and will be ripe in August following.

VII. The Qualities. It is hot and dry in the first degree, Aciduliferous and Nutritious, but Nourishes less than Wheat, Rye, Oats or Barley; but more than Miller or Panick. And Bread which is made of the Meal thereof, is safe of Digestion, and soon passes through the Stomach and Belly, for which reason, it becomes very cleansing to the Bowels.

VIII. The Specification. It keeps the Body open, and prevents the growing too Flabby or Fat, but is a little Flatulent or Windy.

IX. The Preparations. The Meal of it for Mans use, is by the Country People in Germany, Italy, and some other places, made into Bread, Cakes, Puddings and the like, which are pleasant enough to eat.

The Virtues.

X. Bread, Cakes, Puddings &c. made herof, make those People very Strong, and able for Labour, who daily feed on them. The Poultage thereof provokes Urine, increases Milk, locoorn the Belly, and being eaten mixed with Wine (as you do Dimonemery,) it is good against Melancholy. The whole Grain, as also the Meal, is used generally to Fatten Cattle and Poultry of all sorts, and it is observed, that they are quickly made Fat therewith, and to Fat, that if they be not Kill'd in a short time after, they will Dye of themselves, being Sufocated therewith.

Of COW-WHEAT.

XI. The Name. It is called in Greek Κανελλόν, in Latin Crassagumin, (Triculum nigrum) for Theophrastus, lib. 6. cap. 5. and Dioscorides, lib. 4. cap. 17. in Latin Triculum Fuscum, in Belon: Crassagumin Lebelii: Meliogynum Camerarii, Russelis & Thalii: Milium Sylvaticum Tragii, and in English Cow-Wheat.

XII. The Kinde. There are many kinds of this Plant, but most of them are absolutely Stranglers with us, so that we shall only take notice of two the most common, viz. 1. Crassagumin vulgare Lebelii,
Salmon's Herbal. Lib. 1.

The Descriptions.

XIII. The first, or our Common Cow-Wheat, has a Root composed of small Threads, which sends up an hairy square Stalk, branched almost from the bottom, half a Yard high or more, very weak and slender, and furnished by the Buffes among which it grows, having two long and narrow Leaves set at each Joint, broadest next to the Stalk, a little dent'd sometimes about the edges, and pretty sharp pointed at the end, somewhat rough also on the under side, if it be drawn downwards. The tops of the Stalks and Branches are set with Tufts of Leaves and Flowers together, which being green, are separated, two Flowers only standing at a Joint, with the like Leaves set with them, but shorter and smaller. The Flowers are long, round and white, opening open at the end, almost like those of a Dead Nettle, and stand all looking one way, of a pale yellow color and white together, but grow yellower as time, yet in some of a bluish or purplish color, either deeper or paler, each standing in a small green Husk, wherein after wards, grow round Cups or Vesicles, containing brownish Seed, not much unlike to Wheat.

Wheat Cow.

XIV. The second, or Party-colored, or Blew Cow-Wheat. This grows like the former, but the Stalk is more reddish, and so are the Leaves also, and more finely dented upwards, where the Spikes or Tufts of Flowers, are in some of a reddish or bluish color before they spread open, and then show the Flowers to be of a yellowish Purple, sometimes about the Mouth or Gaping place, and the other parts of a Purplish red: but in some others they are Blew, or of a Purplish Blown.

XV. The Pl剧场. They grow amongst Buffes, Beaks and the like, upon Barren Heaths, as at Hampstead near London, also in Pettif Pustures, Buffly Copes, and low Woods, and such like places in many parts of this Land. But the first of them Gerard says, grows upon Hampstead Heath, among the Juniper Buffes and Bullberry Buffes, in all parts of the said Heath, and in every part of England he found it where he travelled.

XVI. The Times. They Flower from the beginning of May, till June and July, and their Seed ripens in July and August.

XVII. The Qualities. They, viz. the Grains, are hot and dry in the first of second degree, of thin and fulful parts, and abound with a great quantity of Volatile Salt. They are Hydrick, Spermogenetic, and excite to Venery.

The Virtues.

XVIII. Authors have said little or nothing of their Virtues, but some small matter of their Uses, as that the Seed being taken inwardly, will affect the Head and Brain, as Darad will, troubling them, and causing a kind of Drunkenness, Vertigo, of Giddiness. The Seed in fine Powder, being given to half a Dram or more, for some space of time, in strong Broth or Wine, is said to provoke Luft.

XIX. As Cow Wheat generally in all places where they grow among Corn thieve, so if they be not Weeded out, but suffer'd to grow till the Corn is Reaped, their Seed mixes with the Wheat in Threshing, whereby when Ground, the Meal is brownish or darker colored, and in the Bread which is made thereof, will be blacker than the otherwise it would be.

CHAP. DCXXXIII.

Of WHEAT Common; Red, White, Grey.
Wheat Naked without Beard or Awns. 2. Triticum album, Triticum arisitata alba, Silage, White Wheat; and this is also wheat, viz. Triticum album Arisita Munitum vel Arisita Spicata, White Wheat with Bearded Ears, or Ears with Awns, or Triticum album maticum, Silage, vel Triticum album Spica mutata, or White Wheat without Beard or Awns, and the white Wheats some think to be as fine a Grain as the former, and some will have them to be the finest and best Wheat of all, without doubt, the difference in Goodness between them is to little as not to be discerned. 3. Triticum Griseum, vel Cinerum, Triticum Griseum arisitata mutatum, and this is that which I take to be the Zees, or Zee_Zee of the Ancients, which they called Spelta or Spelt-Corn; and Ador, also Ador, which the Ancient Romans made to be a kind of For, or Bread-Corn, being a coarser fort of Wheat; This with us, is generally through the Nation called Gray Wheat, and is a very good and profitable sort of Grain, tho' not so absolutely fine and choice as the former Red and White Wheats.

To these let me add, 4. Triticum Spica mutiformic, Triticum ramitum, the Branched, or manifold Eared Wheat, which Tuberemontana calls Triticum Tiphum Spita mutiformic, which for all that I know may be a Species of the Titha, or Titha Circuits, of Dodonea, their Descriptions are so nearly alike.

The Descriptions.

III. The first, or Red Wheat, Its Root is very Fibrous, and towards its Head as it was jointed.

Wheat Red or White, Bearded.

or Husks, which when it is cleansed from them, is of a firm compatt Substance, which of a Dye reddish color, and the whole Ear is of a kind of reddish color when it is perfectly ripe, which is either Bearded with Awns, or not Bearded, but plain and smooth, that being all the difference, which yet makes no Difference in the Goodness of the Corn.

IV. The second, or White Wheat. This in its Roots, Leaves, Stalks, Ears, Flowers, Corn, Magnitude, and manner of growing, differs nothing from the former or Red Wheat, but only in the color, the Stalks and Ears being white, and the Grain or Corn of a clear yellowish white color. This is also twofold, viz. either Bearded with Awns, or plain and smooth without Awns, in the manner as the Red Kind. Some, and the Generality of Farmers, maintain the Red Wheat to be the finest and best Wheat, and to make the Sweetest and Whiteest Bread. While others again maintain this White Wheat to be the choicest of all, and to make truly the best and Whiteest Bread. I indeed know them both very well, and have eaten Bread, Cakes, and other things made of the fine Flour of them both, yet I must say, by all that I could observe, that I could find no difference between the Sweetest, Whitecest and Goodnest of the one and the other, but that to me, the one appeared as good as the other, and without

from whence rise 3, 4, 6, or more or less Stalks, with fair long and green Grosf-like Leaves, and as the Stalks grow up higher, at every Joint ear: Leaf, and at the fourth Joint usually comes forth the long Ear, or Sprayed Head, one on a Stalk, without any branches, which while the Head begins upright, blooming small yellow Aglets, which when it is ripe, a little bows down or bends its Head, by reason of its weight, which is fit with two durable rows of Grain or Corn, within several other sorts
Wheat White Bearded.

Wheat Gray, or Greek Wheat.

Wheat Gray; Zea, or Spelt Corn.

Salmon's Herbal.

Lib. I.

Wheat White Bearded.

and of a brown color; and the Head or Ear hereof, is much larger, of a brown color also, with four Sides or Roots of Grains or Corn, so that it seems to be four square, which is contained in double brown Husks, all which are Armed with Awns, so that the whole makes a large Bearded Ear, and

Wheat Gray, or Greek Wheat.

the color of the Grain within, is almost of the color of the Red Wheat, but much paler, the Corn is itself being much of the same fashion, but plumper, or fuller and larger. The Meal or Flour of this, makes admirable good White Bread, Cakes, &c. but it is scarcely so White as the others, nor yet so Sweet.

VI. The fourth, or Branched, or manifold Eared Wheat. This in its external form of Roots, Leaves and Stalks, is much like the Red Wheat, differing that the Stalk seems to be shorter, and the Ear in color, with its Husks or Chaff, Awns and Grain within it, is exactly like to the Ear of the Red Wheat, differing that the Ear of this has several other smaller Ears, as 2, 4, 6, or more, growing out of the sides thereof. This seems to be a Species of Dodonatus's Tipha, or Triticum Tiphsium, which by the Description thereof, can be no other than our Bearded Red Wheat. It is thus Described. Tipha rises up with a single and slender Stalk or Straw, the Ear is long and round, Bearded with long, hard, sharp Awns, somewhat closely set together, and the Grain is small and light, but hard, and of a redder color than other Wheat, enclosed in divers Chaffy Husks. This seems to me to be Our Red Wheat before Described.

VII. Some may Objeck against me, That Our Grey Wheat is not, nor can be the Zea, or Spelta, of the Ancient Greeks and Romans, because they, that Zea, Spelta, or Greek Wheat, had its Ear Naked, without Beard or Awns, in proof of which, they bring the Testimonies of Camera-
The Virtues.

XIII. Pollen & Siligo, Meal and Esmes. Theo Siligo be the Name of the finest and best Wheat, and of the White Wheat in particular, yet Siligo with them old also signify the purest and finest Wheat-Flower. These are of use to make Bread, Cakes, Puddings, Pultage, Pancake, Flummery, Starch, Leaven, Wafers, Cely, Catapla, &c. Outwardly applied to Simple Wounds newly made, in a large quantity, it profly stops the Flux of Blood, and a Spoonful of them mixed with a Grains of Fair Water, and swallowd down, is good against Heart-burnings, and Acidities of the Stomach.

XIV. Pultage. It is called Alice, ab Alend, from Nourishing, and fo all Latin Authors have Translated Chondria, which is taken to be the most excellent Pultage used in tho' Ancient times: if made of Milk only, or Milk and Water, it is properly a thick Milk; if of Water only, it is Pultage. It is good to strengthen the Stomach and Bowels; it nourishes very well, and stops Fluxes of the Sex, and Spills of the Ancients. I can find no other Grains in the World to which it will, or can agree. As for Cerearmen and Trasger, their Zea or Spelta, can be none of this, if Doctor andSchole at Bury, No such strong nor tall Stalks, nor yet so much growing from one and the fame Root: And as the Stalks of theirs are low, and fewer, so the Kernels are smaller, and not orderly set in Rows; by all which it is evident, that they had no true Knowledge of Zea, or Greek Wheat, which is without doubt what we call Grey Wheat here in England.

XV. The Places. All these Grains are not only Sown almost in all Counties through all the Islands of Great Britain, but also in most parts of the Habitable World. 'Tis true, that not long since they were Strangers in America, but since our English have Planted and Inhabited almost all the Eastern Coast of Florida, from the North of New-Seneca, to the South of Carolina, they have been made Denizens of tho' Countries, and are now become Natives of the fame, and profect with the fame increase and goodness, which they have here with us.

X. The Times. They are Sowed after Harvest in Autumn, before Winter, and tho' they prettily Spring up, are so hardly to endue the tharth of Scarc, that they are liable to their Ripeness in July and Auglet following.

X. The Qualities. All these sorts of Wheat are temperate in respect of heat or cold, dryness or moisture, are Altringem, Vernacular and Nutritive.

XI. The Specification. They flop Fluxes of the Bowels, nourish much, and restore in deep Contumacies.

Pretty thick, which Country People while it is hot, do put into Wooden Dishes, and so bring it to London, to be Sold in the Market, by the Name of Dilly Wheat and Bowl-Wheat.

XIX. Tragus, or Flammery. It is made of the finest of the Flower, mixed with Fair Water in the due proportion, and Build'd up, so as is thicker, & where being cold, it will eat with a Knife, which whilst hot, is put into small, flat, white Earthen Dishes, in which it is kept till it is eaten. They commonly mix with it at Eating, Wine and Sugar, and so it serves, may as well give the Spirit, comports with Nature, and refreshes in Consumptions. Some that are great Lovers of Milk, use instead of the Whim.

XX. Amylum, White Starch. It is made of the finest Flower of the Wheat, by the means of fair Water. Made into a Lezob with Honey, it is good against Coughs, Cold, Rhumors, and Spitting of Blood, and causes an easy expectation of Plegm.

XXI. Fermentum, Leucon. It is made of some Pulce or Dough of the Bread after Fermentation, and being made up into a round flat Ball, it is kept in a hop of Table or Bay-Salt poudred, till it grows fower, which you may know both by the Small and Table. It has a power to draw and digest what is hot off, and therefore is good to be put into a Planner Cataplasm, to cause Suppuration in Tumors. Applied to places affected with the Gout, in a short time cures the pain: It is good also against Warts, and hard Knots or Kernels in the Throat, being applied with some Salt.

XXII. Alcah. It is made altogether in the same manner as you make the Alcah of Barley. The Flower of it being mixed with Tarpetwine, Honey, and an Egg, makes a good Digestive, mixed with Ammonium, Leucon, and a little Vingar, it diffusses and softens hard Tumors; but its chief use is for making that sort of biking Drink called Alcah.

XXIII. Sucrose Meat Wafers. They are Sold at the Confectioners, made up into small white Round. Being eaten, they digest freely the Stomach, and strengthen it, stop Fluxes of the Bowels, and before in Consumptions. As they are made of the purest and finest Flower, with a small addition of Milk, Eggs and Sugar, to put into Water and drink, they cure the Bloody Flux, and are good against Ruptures in Children.

XXIV. The Gelly. It is made of the former Wafers boiled in a sufficient quantity of Water, to the Confinency of a Yell, or it may be made of the Dyl-Wheat, at Sea, XVIII. by adding a little Water to it, and straining it very hot thro' a Chees Cloth. It is good against Spitting of Blood, Coughs, Cold, Hicoulenes and the like, being daily eaten.

XXV. Sanguis seu Extrahum Triviici, Blood of Wheat. It is made as you make the Sanguis Sagartici, Confisales majoris, Pavosius, Porphyra, &c. It is an admirable thing to clear the Heart, revive the Spirits, refresh the Bowels, comfort Nature, restore in Consumptions, and recreate Languishing Nature. The finall White Bread is best to make it of.

XXVI. The Coctemtic. Take of the Flower 4 Ounces, Honey 1 Ounce, Vinegar 2 Quarts, boil them gently together, so long till the Flower will not easily setire. Strain it to be good after: Searc, Morphe, Sun-burning, Tanning, Fricakes, Spots and Pimpls in the Face.

XXVII. The Balsam. Take Turquetine 2 Ounces, 3 Torks of three Eggs, mix them till the Turquetine is perfectly dissolved in the Torks, then add Honey, Balsam of Petus, of each two Ounces, &c.

XXXII. Frumentum, or Frumenty. It is so called from Frumentum, an old Name for Wheat or Corn. It is made of Boiled Wheat, which is sold in Wooden Dishes or Bowls, in the Market in London, and called Dilly-Wheat (or Sea, XVIII. forgoing), by Boiling it up with a sufficient quantity of Milk, to make a Pottage thereof, of the thicknesse. It is stomachick, strengthens the Bowels, stops Fluxes, and restorative in Consumptions.
CHAP. DCCXXXIV.

OF WHEAT INDIAN: OR, MAIZE.

I. THE NAMES. We know no Greek Name for it, but it is called in Latin, Frumentum Turricianum, Turky Wheat; Frumentum Indicum albostrorum; & Miltum Indicum maximum: in English, Turkish Wheat, Indian Wheat, Indian Corn, and Maizere, as the West-Indians call it.

II. The KINDS. We have but One Species thereof, but some may account them Two, by reason of their Magnitude, which I take to be rather from the Nature of the Soil, a rich Soil affording a very large fruit; whereas a poor Soil gives you only a Dwarf kind of Plant: But there is a great Variety in the Colors of the Ears, some being all White, some all Yellow, some all Red, and some Blow. And again, some have Grains of all those Colors at once; but this difference, we account makes no differing Species of the Plant.

The Descriptions.

III. Its Root in Thick and Bulbs, full of grous Fibres or Strings, from whence springing up several strong and tall Stalks or eight Feet high, as thick as a Girl's Weft, if it grows in any rank Ground, full of great joints, with a white Spongy Fust in the middle. The Leaves are long, twice as

Wheat Indian: Or, Maize.

large as those of Millet. At the Tops come forth many Flowers in Feather-like Sprigs, bending downwards, like as the Tops of Millet, which are either

White, Yellow, Red or Blew, as the Grainers in the Ears will prove. These Flowers fall away without any thing of an Ear succeeding them; But whilst this flowering is, come forth the Bars at the joints of the Stalks with the Leaves, from which in two or three of the lower Joints up, towards the Top of the Stalks, One at a joint, which have many Leaves enclosing them, and are small leaf at the Top, with a small long Ear of Hairs or Threads, hanging down at the Ends, which when they are Rape, are to be gathered. The Leaves enclosing the Ear being taken away, the Head or Ear appears, much like to a long Cylinder (not a Cone) fist with 6, 8, or 10 rows of Grains, as large almost as Peas, and sometimes larger; not fully round, but flat on the sides which join one to another, orderly and very closely set together, of the same Color on the outside as the Bloomings were, viz. either White, Yellow, Red or Blew only, or of some or all of those Colors together; the whole Grain is hard and brittle, its external husk being very hard almost like a Shell, but its hoard Fust, when ground into Meal and Flour, almost as white as Snow; which Grains, when Chored, are somewhat dry, and not cleanly in the Meal, as our Wheat is.

IV. The Places. It is said to grow in Turkey, and that it was first brought from thence: It is true, that it is now universally Planted almost all over the West Indies; but it is certain, that it was not an aborigine of those Countries: As we find carried thither by Europeans. It requires to be Planted in a rich and fat Ground, as Millet does; for a poor lean Soil, makes but a poor fruit of Corn. It has been Planted in our Gardens in England, and in very hot Summers has come to perfection with us.

V. The Times. It is Sown in the Spring, in March and April, and the Grain is for the most part ripe in July and August.

VI. The Qualities. It is Temperate in respect to Heat or Cold, and dry in the Rift Degree, Ab-\ 

lurive, and very nourishing.

VII. The Speciation. It indigests the Stomach, Bowels, Reins, and Urinary Passages of Tartarous Maculage; Informed, that is said to be very efficual to hinder the breeding of the Stone. It also nourishes well, with a thin and Abstirive Nutrit-\ 

ment, and reftores in Consumptions.

VIII. The Preparations. In the West Indies there is made thereon, 1. The boiled Grain or Mauze. 2. Pottage. 3. Homine. 4. Bread, Cakes, Pad-\ 

dings. 5. Parceid Corn. 6. A Cataplasm. 7. The whole Grain.

The Virtues.

IX. The boiled Grain or Mauze. The Corn is first steeped a little in warm Water, then beaten in a wooden Mortar with a wooden Pestle, till all the external hard Hull is beaten off; then it is boiled in Water till the Grain is perfectly soft and burst in the boiling, and becomes almost like to our boiled Dibô Wheat. They Eat it being seasoned with Salt, by mixing with it Butter, or Milk, Cream or Wine, and Sugar, it admirably nourishes and strengthens, and makes the Country Man able to go thro’ Labour and Battles.

X. Pottage. The Grain is steeped from the external hard Hull as before, then being dried in the Sun, it is ground in a Mill to Meal, which being Sifted, and boiled in Water till it is soft, is then boiled longer, till it becomes of the consistence of a thin Softy Pudding. It is Eaten as the Former boiled Grain, with Butter, Salt, Milk, Cream, or Wine and Sugar, and has the same Effects in nourishing and strengthening those that Eat it.

XI. Homine.
XI. Homine. This answers to the Frumenty made of our boiled Wheat. They take either of the former boiled Maize, or of the Poltage, what quantity they please: to which they add a sufficient quantity of Milk, which being boiled, may make it of the thickness of our English Frumenty, and some salt in so much Milk as to make it a little thinner, according as every one likes. They generally eat it, being made Savory with Salt and Butter, and some put Sugar to it. It has all the former Virtues and Effects, besides it cleanses the Bowels, and always keeps them Soluble, at least from being Collyve.

XII. Bread, Eaters, Puddings. They are made of the Flower, with Water or Milk. This Bread whiff! New, is wonderful Sweet, beyond any that can be made of European Wheat, but being stale, it ears Something harsh, and more unpleasing: After one is used to it, it is then Eaten with a Gratification to the Stomach. Some make the Bread, &c., with half Flower of Althea, and half Flower of Wheat, and some add to the Flower of Althea, Eddy Roots boiled soft, which makes the Bread keep moist a good while.

XIII. Parceled Corn. This whether it be of the dryed Corn, or before it is ripe, is much eaten by the Indians, because of its coarse Preparation, and its exceeding Gratification to the Palate.

XIV. The Caterpilfer. The Flower mixed with Lemon, and brought to a Conspicuous with Oil of the Seeds, Kinias or Palma Ciliata, or strong Batters, being applied, is said to ripen Apothecaries.

XV. The whole Grass. It is given to Cows, Oxen, Horses, Hogs, Poultry, &c. to Nourish and make them Strong, and also to Fatten them.

CHAP. DCCXXXV.

OF WHITLOW-GRASS: or, NAIL-WORT.

I. T.H.E Names. It is called in Greek Therapeus: in Latin Paronychia: and in English Whitlow-grass, or Nail-Wort.

The Descriptions.

III. The first, or our Common Whitlow-Grass. Its Root consists of a Branch of small Fibres; from whence proceed many small and long Leaves come next to the Grass, somewhat like to those of Chickweed, but something longer and whiter,

Whitlow-Grass Common.

from among which, several slender naked Stalks, not above 4, 5, or 6 inches high, bearing many white Flowers one above another, exceeding small, after which, come small flat Pouches, lesser than any of Thalpi, in which is contained very small Seed, of a sharp Taste.

IV. The second, or Jagged, or Roes-like Whitlow-Grass. Its Root is small and Fibrous like the former, which sends forth some pale or reddish green Leaves, cut in on the edges into 2 or 3 small parts, almost in fashion like to the Leaves of Rue, from among which, grow up divers al-

Whitlow-Grass Common.
Chap. 736. *English Herbs.*

**Whitlow-Grafs, Jagged.**

moft naked Stalks, each spread out into several Branches, all of which, base at every point, one single but smaller Leaf, much like the former, which Stalks towards the top, bend a little downward, with some white Flowers at the top, greater than the former, and have which hold the Seed, which is rather grey.

V. The third, or Greater Whitlow-Grafs. This from a small fibrous Root, has very many Leaves springing forth, and lying on the Ground in a round Compass, one by another, about 3 inches long, and an inch broad, spiny, rough, hairy, of a dark green color, and a little curled about the edges, growing on short Footstalks, from the middle of which, rise up one or two, rather few, small round naked Stalks, with few, or rather no Leaves thereon, so much as to stand upright, but bending downwards, at their tops come forth several small white Flowers, after which, come small long Pods, containing small reddish Seed, but nothing so hot or sharp as the Seed of the first.

VI. The fourth, or Lesser Whitlow-Grafs. It has a Root which is small, hard and woody, the Plants is smaller than the former, bearing fewer Leaves lying on the Ground, fewer than the Greater foregoing, like unto the lesser Mouse-Ear, called Cats-Foot, but not so hairy, yet a little hoary, of a yellowish green color; from among which, grow up several small, frail, and crested Stalks, 6 inches or more high, branching forth at the tops, where come forth several white Flowers, after which follow very slender long Pods, like the Poes of Eleither, full of small reddish Seed, as sharp and hot in Tolle as Grenels.

VII. The Plants. The two first are often found to grow upon Brick and Stone Walls, and upon old Tiled Houses which are come to have much Moss upon them; and sometimes they are found growing upon flaxenly and dry Mud Walls. The two last are found growing upon Open Hills, and other like dry Grounds.

VIII. The Times. They Flower very early in the Spring, sometimes in January and February, if the Weather be mild; for about the end of April, when the Weather begins to grow warm, they die away, and are no more to be seen all the Year after.

IX. The Qualities. They are all of them hot and dry in the third or fourth degree, Attractive and Subpurative.

X. The Preparations. You may make, 1. A Balsam or Ointment of the whole Herb. 2. A Cataplasm thereof.

---

**C H A P. DCCXXXVI.**

**Of Whortle-Berries:**

**OR, BILLBERIES, Heath and Marsh.**

I. T H E Names. It is called in Greek *Ampelos rubra,* in Latin *Vitis idaea,* i.e. *exparax.*

(B) *Idea quam vacua Ptolomaeus,* *Vitis Idea Theoophrasti:* in Latin *Vaccinae,* *Vaccinium Drosera,* and in English Whorts, Whortle-Berries, and Billberries.

II. The Kinds. Authors make 9 or 10 Species of them, or more; we shall describe thole only which are most known and common to us, which are the four following, viz. 1. *Ampelos exigua Lugdunensis, Matthisi,* & Tothi (but certainly it is no Myrtle, nor Species of a Myrtle) *Vitis ideae vulgaris bacis nigra,* Camerarii, Chiefi, & Gefneri; (but it is not the *Vitis Idea* which bears Carnos, for that Noble Vine grows not on so high, or Snowy Mountains, but in the Plains and Open Hills, being a Cultivated Vine) *Vaccina nigra,* Dodonaei & Lobei, Balsam pretium genus Cataplasis, Our Common Black Whorts or Bilberries. 2. *Vitis Idea rubra* (by all Writers thereof) *Vitis Idea folijs bursis Chiefi,* *Radix Idea frutu rubro Anguillari:* (as he called the other *Radix Idea frutu nigro:* ) *Radix Idea Discripi* *rubra* *Lugdunensis,* and *Vaccinia rubra* by almost all Authors, Our Red Whorts, or Bilberries with Green Leaves. 3. *Vitis Idea tertia Chiefi,* *Myrtomis,* *Petromelis,* *Pyrus Cornus,* *Pyrexer Idea Gesneri,* Sweet Whorts or Bilberries. 4. *Vaccina palustris Dodonaei & Lobeli,* *Artemisia palustris Gesneri* in Horti; *Oxyacmena Cordis Vitis Idea palustris Bachini,* *Vaccinium palustris,* Marsh Whorts, or Bilberries.

---

**The Descriptions.**

III. The last, or Our Common Black Whorts, or Bilberries. *Its Root grows ayove under Ground, shooting forth in several places as it runs. It is a small Root, which creeps as it were upon the Ground, scarce rising a root and half high, with several small dark green Leaves, set on the green Branches, which it spreads abroad on both sides,
Salmon's Herbal.  Lib. 1.

V Whortle-Berries:  

O R,

Billberries Black.

are somewhat long with their roundness, and a little shrunken about the edges, of a full green color above, and very heavy underneath. At the fomes with the leaves, come forth many white flowers, consisting of four leaves, one of which, some small round berries, somewhat bigger

V Whortle-Berries:  

O R,

Billberries Sweet.

than Haws of the Have-Thorn, and black when they are ripe, having a small Crown as it were of five small points, and are fappy, of a sweet Taste, containing blackish Seed within them.

Whortle-Berries, or Billberries Marsh.

V. The third, or Sweet Whortle, or Bilberries, (which some call French Whortle-berris) This rises up with several thick, smooth, woody Stems or Stalks, 10, 1, 6, or 7 feet high, their lower parts being somewhat rough, and covered with a blackish Bark, the upper Branches being green, flared with many Leaves thereon, set without order, which
Chap. 737. English Herbs.

VI. The fourth, or Marth-Whoons, or Billberries, is Root in long and white, running alofe under the Earth, and not down right; whence spring up several slender brownish branches, like unto Strings, fourteen to sixteen a Foot in length, creeping upon the Ground, before with small, Roof leaves like unto those of Thyme, at certain distances, green on the upper side, and oftentimes hairy underneath. The flowers come forth at the top, growing upon long thready filaments, consisting of five reddish leaves, and an Umbo or Pointe in the middle, which turn into round reddish Berries, having a yellow Agrimont Taffe.

VII. The Places. The first grows on many Heath's, and in Woods, and on Barney Hilly places in many parts of England. It has been found on Maniple-Heath, Windley-Common, and St. John Wood, not far from London. It prospers best in a Lean Barney Soil, and in Untilled Woody places; and are now and then found on high Hills to the South, and upon Mountains. They grow in many other parts of England, as on the Hills in Cheshire, called Brown-Hills, neath Beesoon-Giffe, and Several other places. The second in the North-parts of this Land, as in Lancashire and Yorkshire, on the Hills in Lancashire, upon Pendle-Hills, and in Westmorland, at Croby Revefeworth, &c. The third grows as Label says, on every Hill in Framework, and some day they have found it growing in the Southern part of our Island. The fourth grows only in Moorish places, which are often covered over with Moss, in Bogs, Watery and Fenny places, especially in Cheshire and Staffordshire, where it is found in great plenty.

VIII. The Times. The first three Flower in March and April, and sometimes in May, and the Fruit of the Black is ripe in June and July, but of the other two later. The Marth kind Flower in July, and their Fruit is ripe in August.

IX. The Qualities. The Berries of them all are cold and dry, in the second degree, Attirnent, and Anti-Emmenagogick.

X. The Description. The Juice of the Berries flog Women's Courts, and all sorts of Bleeding's, and are good against all Fluxes of the Body. It quenches Thrist, stops Vomiting, extinguishes the heat of Burning Fevers, stops Coughs, and is good against a Phthis, and other Diseases of the Lungs.

XI. The Preparations. You may have, 1. The ripe Berries. 2. A Rob, or Syrup of their Juice. 3. A Confer. 4. A Purple blow Dye. 5. A Crimson color or Dye.

The Virtues.

XII. The ripe Berries. The Black Whorts are eaten in the Countries where they grow, with Ceam or Milk, and sometimes with Wine, as eat Strawberryes, and so they cool and refresh the Stomach, stop Vomiting, allay the heat of Choler, and bind the Belly.

XIII. The Rob, or Syrup. They are good against the Heat of burning Fevers, cool a hot Stomach and Liver, refit Vomiting and Nauseaufnes, quench Thrist, are good against the Bloody Flux, and stop all other Fluxes of the Belly, as also Cholerick Fluxes in particular, and are good to cure all inward Fluxes of Blood, as Spitting and Vomiting Blood, Pilling Blood, Bloody Stools, or Hepatick Flux, the overthrowing of the Loches, as also of the Terms in Women, &c. and are profitable for such as are troubled with an old Cough, and Obstructions of the Lungs, and are said to be good against a Phthis, or an Unercation of that Bowel.

XIV. The Confer of the Berries. It has all the Virtues of the Rob and Syrup, and may be given Morning, Noon and Night, to the quantity of a large Chaldron.

XV. The Purple color'd Dye. Toogar says, that the Country People take a Pot full of the Juice of the Black Berries Brained, into which they put a Spoonful of good Wine Vinegar, an Ounce of Alum, and a quarter of an Ounce of Copper Flings, or Borings, or Scalls of Copper, which they boil altogether, and make a Dye thereof. Into this Dye or Liquor, they put Cloth, Wool, Thread, Yarn, &c. letting them lie in it for a good while, which afterwards they take out and dry, and then wash them with cold Water, so will they have a Turky Blew color, and it they would have it deeper, they put it into an Ounce of broken Glass. Also with the Juice of the Berries, Palmers color Cards, Paper, Maps of Countries, of a Purple Blew color, putting thereon some Alum and Glass, by which they make it lighter or deeper, as they please.

XVI. The Crimson Dye. It is made of the Juice of the Red Whortle-berry, by adding thereto a little Alum. The Juice of these Red Whortle-berrys, when of an excellent red color, and the Berries are all full of Juice, is of so Orient and Beautiful a Purple to Limine withal, that Indian Laces is not to be compared to it, especially when this Juice is prepared with Alum according to the same. As my Author has proved by Experience.

CHAP. DCCXXXVII. Of WILLIAMS and JOHNS Sweet, Garden and Wild.

1. THE Names. They have no known Greek Name, but are called by this general Name in Latin, Armerius: Of form Antherus, and Coryphæus Solstitialis; In English, Sweet Williams and Sweet John.

2. The Kinds. They are either Latifolius, broad Leave'd, which are called Sweet Williams, or Anguliferius, narrow Leave'd, which are called Sweet John's. Of these there are these following Kinds, viz. 1. Armerius latifolius simplex flor albo, fingle white Sweet Williams. 2. Armerius latifolius simplex flor rubro, single red Sweet Williams. 3. Armerius latifolius simplex vericolor, five Variegatus, fingle spotted White Williams, or London Pride. 4. Armerius latifolius simplex flor rubro fulvo latifloro, fingle deep red, or Murre colored Sweet Williams, or Velvet Williams. 5. Armerius latifolius flor rubro multi-plici, double red Sweet Williams. 6. Armerius Anguliferius rubens simplex, fingle red Sweet John's, or single red narrow leave'd Sweet Williams. 7. Armerius anguliferius albus simplex, fingle white Sweet John's, or narrow leave'd white Sweet Williams. 8. Armerius anguliferius duplex, double Sweet John's, or double narrow leave'd Sweet Williams. Gerard says, that doublefled Sweet Williams are a kind of wild Gilliflower.
Williams Sweet Red.

have broader and darker green Leaves, somewhat brownish, especially towards the points; and that the Flowers stand thicker and closer, and a great many more in number together in the Head or Tafe, having small pointed Leaves among them, but with prickles uniburtful. The color of the Flower is of a deep red, without any mixture or faint at all.

V. The third, or single speckled Sweet Williams, or London Pride. The Roots are some long, and some small and thready, running under the uppererst draft of the Earth. These spotted Williams are very like the former red Williams, in their form and manner of growing, having Leaves as broad and brown, sometimes as they: The Flowers stand as thick or thicker, clustering together, but of very variable colors: for some Flowers will be of one color, and then many or more spots upon them, others will be full speckled or sprinkled, with white or Silver spots, circleswise about the middle of the

Johns White and Red Double.

Belonging to Sect. 10.
WILLIAMS Wild: or, CROW-FLOWER.

XVI. The Kinds. Gerard lays these are a Species of the Gilliflowers, or of the Sweet Williams, and are taken by some to be the true Gilliflowers; but he declares it to be a kind of Wild Gilliflower: Of these we have, 1. The Male Wild William, or Crow-Flower. 2. The Female Wild William, or Cow-Flower. 3. The Double Wild William, or Cow-Flower.

The Descriptions.

XVII. The Fifth, or Male Wild William, or Crow-Flower. It has Stalks of 9, 10, or 12, Inches high, with Leaves thereon by couples at every Joint, which are small and thinly pointed, very rough and hairy. The Flowers are at the tops of the Stalks many in one Taft, finely and curiously jointed on the Edges, suffer than those of Gilliflowers, but well resembling Sweet Williams, which are of a light Red or Scarlet color.

XVIII. The Second, or Female Wild William, or Crow-Flower. It differs not from the former Male, but in its Magnitude this being bigger, and the Flowers more finely jagged, like the feathered Pinks, of which this is said to be a kind.

XIX. The Third, or Double Wild Williams, or Crow-Flower. This differs nothing from the first Crow-Flower, facing that that is single flowered, whereas this is double flowered, having many fair double Flowers.

XX. The Places. They grow all about in Meadows and Pastures, and in low Mossy Grounds: but the double kind has been brought into Gardens, where it grows very fair and pleasant; I suppose from the goodness of the Soil.

XXI. The Times. They begin to flower in May, and continue flowering till towards the latter end of June.

XXII. Of their Virtues. Authors are silent they only serve as Ornaments for Gardens, Walks, Houses, and other places.
CHAP. DCCXXXVIII.

OF WIND-FLOWERS: OR, ANEMONES.

I. THE Name. This Plant is called in Greek Anemone, and in Latin, Herba Venti; in Spanish, Anemone; and in English we call them Anemones and Wind-flowers.

We have already in Chap. 13, and 14. of this Work foregoing, briefly orculled of the Gardens and Wild Kinds of this Plant, none of them intending to make this our Herbal a Philologus: but afterwards upon second Thoughts, confidering how acceptable it might be to Herftifts, to Purfuits of Quality, Gentlemen and Ladies, who Curiosity might lead them that way, and were very inclined and indulging in improving themselves in the Knowledge and Culture of Flowers, we then refolved to make it as useful to them as we could, and therefore in all the following Directions, where we have treated of Flowers, we have been very careful to give the Curious and indulgent that way, if not a plentiful Satisfaction; yet such an Introduction to the Knowledge and Culture of them, as we hope may gratify all the Lovers of those admirable Curiosities. And so in order to the fame Resolutions, facing we had been fo brief in the fift Chap. 13, and 14. under the Title of Anemones, we shall now plentifully supply here, what were defirive in those.

II. The Kinds. There are 1. The Wild Kinds, of which we have already treated in Chap. 14. and Chap. 543. foregoing, of which we fhall lay no more. 2. The Garden or Natural Kinds, of which we fhall treat more fully in this Chapter, and they are, 1. Anemone latifolia flore simplici, Broad Leaf'd Anemone Single Flower'd. 3. Anemone latifolia flore multiplo, flore plano, Broad Leaf'd Anemone double Flower'd. 4. Anemone tenuifolia flore simplici, Narrow Leaf'd Anemone Single Flower'd. 4. Anemone tenuifolia flore duplo, flore plano, Narrow Leaf'd Anemone double Flower'd. 5. All of which in order. Of each of these principal kinds, there are a great number of Varieties, too many to be fpecificd in this Edition, and therefore avoiding that trouble here, we will give you the feral and various, or particular Appellations in Course, as they fhall be Dcribed.

The Descriptions.

I. Of Broad Leaf'd Single

ANEMONES.

III. 1. Anemone latifolia flore simplici, Broad Leaf'd Anemone with Single Flowers. Its Root is robust, with some Fibers adjoining to it. Its Flowers are all Single, with one Row of Leaves, and a hairy Head in the middle, of a color differing from that of the Leaves. It is of divers sorts and colors, some bigger, others smaller, some taller, others lower, and the Flowers are of divers Reds, Purples, Scarless, deeper or paler, even to Pink, or Peach color, white, Silver, or of color, some

Wind-Flower Garden Single.
V. 3. Anemone latifolia Purpurea Stellaris, five  
Papaverose flore simplici, The broad Leaved  
Single Purple Star Anemone, or Violet-Flower.  
Its tuberosous Root is blackish on the outside, and  
white within, knobby, with many Fibres growing  
from it. Its first Leaves, which always rising up  
before Winter, (if the Root be not kept too long  
out of the Ground,) are something like the Leaves  
of Scenti, or Soft-Leaf, but the root which fol-  
lows, are more deeply cut in or Jagged. Among  
which rife up divers round Stalks, belfer with jag-  
ged Leaves, (as all other Anemones are,) above  
which Leaves, the Stalks rise up about 2 or 3  
Inches, bearing one Flower a piece, composed of  
12 Leaves or more, narrow and pointed, of a black  
Purple, or whithis Ah color, somewhat shining on  
the outside, and of a fine Purple color tending to  
fo a Murry, on the inside, with many blackish blow  
Threads or Thorns in the middle of the Flower,  
let about a Head, in which grows the Seed, which  
is small and black, inclined in fott Wodd or  
Downs, which flies away with the Wind, carrying  
the Seed with it, if not carefully gathered.  
VI. 4. Anemone latifolia flore purpureo Stellaris  
altera forma, The broad Leaved Single Star  
Flower'd Purple Anemone or Violet-Flower. This  
does not differ from the former in Leaf or Flower,  
living that this is of a more pale or dull color  
on the outside, and of a paler purple color on the  
inside.  
VII. 5. Anemone latifolia Viole purpurea flore  
simplici, broad Leaved single Violet colored An-  
emone or Violet-Flower. This has but 8 Leaves,  
as many of them which follow have) and is of a  
Violet Purple color, whence its Name: Of these  
3 left leaves, there are some which differ only in  
having white bottoms, some smaller and some larger.  
VIII. 6. Anemone latifolia flore simplici, pur-  
purea crisata, Broad Leaved single, purple, fli-  
ped Anemone, or Wind-Flower. The Purple is  
the same with the former, but a little paler, read- 
ning more to redwsh, white Flowers have many  
white Lines and Stripes thro' the Leaves.  
IX. 7. Anemone latifolia flore simplici Cornus  
violacea, Broad Leaved single Flower'd, fenth  
blush colored Wind-Flower. Its green Leaves are  
something larger, and fo is the Flower likewise,  
covering in a number of rows there is more of, or  
the color of Carnation Silk, sometimes pale, and  
sometimes deeper, with a whitish Circle about  
the bottom of the Leaves, which Circle in form is  
larger, and more to be fent than in others, when  
the Flowers lay it fell open with the heat of the  
Sun; having withhew Threads in the middle.  
This may be called the Carnation Anemone, or  
Wind-Flower.  
X. 8. Anemone latifolia flore simplici Perfici  
Violetae, The broad Leaved Gredeline color'd single  
Wind-Flower. This Gredeline color is between a  
Peach color and a Violet.  
XI. 9. Anemone latifolia flore simplici Cohina-  
olee, Broad Leaved single Cochina Wind-  
Flower. This is of a fine redhsh Violet, or Pur-  
pal, or Cochina color.  
XII. 10. Anemone latifolia flore simplici Car- 
dinolai, Broad Leaved single Flower'd Cardinal- 
Wind-Flower. This is of a rich Crimson red color.  
There is another fort of it which is deeper, called  
Sanguinea, or Blood red Anemone, but it is not of  
fo lively a color: And another called Cremeina,  
called the Crimson Anemone, which is of an ordi- 
nary Crimson color.  
XIII. 11. Anemone latifolia flore simplici Co- 
cinea, Broad Leaved single Carmel colored Wind-  
Flower. This is near unto a Scarlet color.
have) each stalk bearing at its top one large flower apiece, which is large and double, consisting of many narrow, long, sharp-pointed leaves, the outmost of which, are broadest and greenish at first, but afterwards reddish, with some stipes of Orange Tawny; the middle leaves within these are smaller, and of a red color, or of an Orange Tawny; the innermost being smallest, are wholly of the same color, but turned somewhat inward, covering the Head or Button, which is oval in the form of the Flowers of most of this kind; these having no Thumbs or Threats in the middle as the former have, nor bearing any Seed.

XX. 2. Anemone laxifolia Chelidoniea altera, f. Purpurea, f. var. rosea. The great broad Leaved double Orange Tawny Wind-flower. The Root of this is like the former, and its large Leaves are so like the bill, that one can hardly distinguish them austerior; the Stalk also has the like Leaves upon it, bearing at the top a fair Large Flower, consisting of many leaves, let in two or three of large round pointed Leaves, of a light Scarlet Orange Tawny color. These Leaves being not so thick, or double as the former, seeming to be one thick row, of many small long Leaves, of an excellent Cinnamon color, wherein some yellow is mingled, which makes that color we call an Orange Tawny. The bottoms of the Leaves are red, with a whitish Circle; the plump-head in the middle, being befted with many dark blackish Hairs or Tubers. The Flower and the former, are much common, and well known of all the sorts of double broad Leaved Anemones.

XXI. 3. Anemone laxifolia f. f. var. f. roseo-coccineo variegate Anemone Cyprium. The broad Leaved double Scarlet Flower, the double Cyprus Anemone or Wind-flower. Its Root differs not from either of the former, and has Leaves very like the leaf double Anemone, but not altogether like it; the former being double. These Leaves, and of color very near unto the Leaf Double Orange Anemone, but thicker of Leaves, tall as double as the leaf, all the not so great a flower, without any Heat therein, nor any Threats about it, as in the last. Mr. Rea says, that the Stalk is tall, and that it bears a gallant large double flower, of a rich Scarlet color, and every Leaf thereof finely striped and variegated with white; and that it far surpasses any of the former.

XXII. 4. Anemone laxifolia Comenii Marginata, f. Perfica: The broad Leaved double Perilian Wind-flower. It came out of PERFICA to Crinatum Scandens, and from thence to us. In its Root and Leaf, it is very like to the former double Anemone, only the Flower herof, is rather like unto the second, great double Orange colored Anemone, at Sept. XX. above, usually called Piano major f. f. var. f. roseo-coccineo variegate being composed of three rows of Leaves, the outmost row consisting of 10 or 12 larger Leaves; and those more inward, lighter and more in number, but all of them variegated with red, white, and yellow, having their bottoms white. But instead of a middle Head with Thumbs about it, as the other has; this has a few narrow Leaves, of a deep yellow color in the middle, the Flower standing upright.

XXIII. 5. Anemone laxifolia f. f. latea duplicis: The broad Leaved double yellow Wind-flower. Its Root is Tuberculous, and like the Root of the single, and has such broad round Leaves as the single, but somewhat larger or ranker. The Stalks are beft with larger Leaves, more deeply cut than on the edges. The Flowers are a more pale yellow, with some purplish Veins on the outside, and a little round pointed; but they are all on the infide of a fair yellow color, consisting of two rows of Leaves, of which the inmortal is the narrower, with a small green Head in the middle, encompassed with yellow Threads, as in the single. This has little or no Smell, and springs up and flowers later than the single kind.

XXIV. 6. Anemone laxifolia f. f. variegate Coccinee: The broad Leaved double Scarlet colored Wind-flower. The Leaves are green, but smaller than those of Piano major, and about XX. the Flower is thick and double, consisting of many round pointed narrow long Leaves, which are wholly of rich Scarlet color. There is Cocinea altera, a variegated form of this kind. There is also another which bears double Flowers, almost as large as the first, which are of the color of Mentum, or Red Leaved.

XXV. 7. Anemone laxifolia f. f. variegate rubrae: The broad Leaved double red Wind-flower. It has dark green Leaves, and a small double blood-red Flowers, consisting of many narrow pointed red Leaves of this kind there is another like unto it, only the Leaves of the Flowers are tip, and a little edget with white.

XXVI. 8. Anemone laxifolia f. f. variegate purpurea: The broad Leaved double purple variegated Wind-flower. It differs from the next following, chiefly in Nobleness of the Flower, which is larger, Scarlet, and of a rich and clear reddish Purple color; and every Leaf thereof, fitted with about white.

XXVII. 9. Anemone laxifolia f. f. variegate purpurea: The broad Leaved double purple variegated Wind-flower. It has broader Leaves than the 7th foregoing, and of a brownish green color. The Flower is something larger, and the Leaves thereof not so numerous, but broader, of a Murrey Purple color. There are divers sorts like unto this, which only differ in the color of the Flowers, some being deeper, some lighter, and some of a pale Purple, which by long standing before they fall, almost leem white.

XXVIII. 10. Anemone laxifolia f. f. variegate purpurea: The broad Leaved double variously colored Wind-flower. This is almost like to the before, but at Sept. XIX. foregoing, but latter, whose Flowers are very thick and double, some being white, or whitish, some purple, deeper or paler, some of a paint or flesh color, and some of a reddish color tending to Scarlet, or Carmine. There are four varieties not easy to be Named, which all of them continue constant in their several appearances or colors.

III. Of Narrow Leaved Single ANEMONES.

XXIX. The single narrow Leaved Anemones are of great rarity, variety and commons, than the Laxifolia. Formerly we had but few of these Flowers, and such as were very scarce, but now of late years we are become Masters of a great Variety of them, admirable in their kinds, of divers colors, plain, edged, striped or marked, Reds, Purpures, Scarlet, Scarlets, Pinks, Black color, and Black, with Yellow, Sanguine, and White. And some others raised from the Seeds of these, which produce gallant Double Flowers of several colors, as Reds, Scarlet, Purple, &c. both plain and striped which have more resembled the Flowers of the Double Laxifolia's, than those with narrow Leaves;
Chap. 738. English Herbs. 1263

that consist of many seming broad Leaves, having no Buds or Thrum of Leaves, but a small Head or Button in the middle, some having but two to three Leaves, and some from three to eleven, and double, that the Head in the middle is not to be seen, until the Flowers fall. And yet these kinds, (especially the thinner sorts) forfeit their Souls, from whence the Flowers may be produced. These are called Herathrepodrites, for that they partake of both kinds, as having the Roots and Leaves of the Narrow, and the Flowers of the Broad Leaved Anemone.

XXX. In the handling and ordering of the rar’est sorts of these excellent Flowers, some particular care is to be taken, for the Soil, Situation, Time, and Mode of Planting and taking up, be not exactly observed, the Flowers will neither be fair, nor will the Roots prosper and increase, but on the contrary rot and confime, more especially all the leafy Double kinds with narrow Leaves, but the ordinary, and those with Single Flowers, are more hardy.

XXXI. 1. Anemone tenella folia simplex subgen. The Common Narrow Leaved Single Wind-Flower. Its Root is much bigger than the Double kind, and apter to increase, and the green Leaves are larger, taller, and more in number than those of the former. The Stalks are tall, and bear plentifully fair large blud colored Flowers, commonly consisting of one row of broad Leaves, with a hairy Head or Button in the middle, which after they blow, grow big and long, yielding more of small flat brown red, involved in Down.

XXXII. 2. Anemone angustifolia, fex Crassifolia folia simplex, Narrow Leaved Anemone or Wind-Flower. The Root is blackish without, and extends itself in long tuberous pieces, somewhat like to those of the Broad Anemones. It springs out of the Ground, till the great Winter Frosts be past, viz. about the middle of February, when thin cut Leaves come forth, somewhat brownish at their first appering, but afterwards spread out into winged green Leaves, something broader than the root which follow, divided into three parts, and each part into three Leaves, every one cut in about the edges, one thread long, and a long slender Foot-stalk, and the end-Leaf by it left. Among these, rise up two or three green Stalks, garnished with such like thin Leaves as are at the bottom, from whose middle rise the Flowers, but upon one Stalk, consisting of 14 or 15 small pale watchet, or blew Leaves, different from any of the Single Kinds which follow, which compass many whitish Threads, and a small green Head in the middle, something like the Head of the Wild Crowfoot, in which is contained such like Seed.

XXXIII. 3. Anemone angustifolia folio simplex subgen. Narrow Leaved white Single Flower Anemone. This is a Species of the last described, but with this difference, That the Leaves of these are not brown at their leaf edges, but green, and that the Flowers in this are white, in that blew.

XXXIV. 4. Anemone angustifolia purpurea cauliflora, The common narrow Leaved Single Purple Windflower is smaller, and more spreading every way into small, long, flat, Tuberoous parts, than any other kinds of Single or Double Anemones. This is one of the most common Wild Flowers found in two leaf regarded ; it has many winged Leaves standing upon several Stalks, cut and divided into divers Leaves, much like unto the Leaves of a Carrot. Among which, rise up Stalks with some leafes thereon. (as is usual to the whole Family of the Anemones, both Wild and Manured,) at the tops of which stand the Flowers, consisting of six Leaves commonly, but sometimes they will have but five, being very large, and of a perfect purple Violet color, very fair and lively. The middle Head has many blackish Thums or Threads about it, but never heard that it was ever found to bear Seed.

XXXV. 5. Anemone angustifolia fere simplex, Corna palida: Narrow Leaved Single, pale Blud colored Wind-Flower. This in its Root and Leaf is like the former, but the Flower is nothing so large, but is whitish tending to a Bluish color, and of a deeper Blush towards the bottom of the Flower, with whitish Bluish Thums in the middle, never being obserd to give Seed.

XXXVI. 6. Anemone tenella folia simplex, Corna bifida angustiglabes albus: Narrow Leaved Single lively Blud colored Wind-Flower, with white bottoms. This is like the lift in Leaf and Flower, but that the Flower of this is larger, and its Nails or bottoms are white.

XXXVII. 7. Anemone angustifolia folio simplex, alba vel purpurea: Narrow Leaved Single white Anemone, with Purple Veins. This is like the former, but the other, and being white, has Purple colored Veins and Stripes running through each Leaf.

XXXVIII. 8. Anemone tenella Coccinea simplex, thin Leaved single Scarlet Anemone. Its Root is tuberous, but consisting of thicker pieces, somewhat like unto the Root of the broad Leaved Anemones, but somewhat brown, and not so black, most like unto the Root of the Double Scarlet Anemone. The Leaves are something like unto the former, but a little broader, and not so finely cut and divided, the Flower consists of many considerable large Leaves, of an excellent bright Red or Scarlet color; the bottoms of the Leaves are large and white, and the Thums or Threads in the middle, of a bludhish Purple color.

XXXIX. 9. Anemone tenella simplex Coccinea subgen. alba vel purpurea, Narrow, or thin Leaved single Scarlet colored Wind-Flower. This is very near to the color of the lift described, and without any white bottom in its Leaves.

XL. 10. Anemone tenella simplex folio Hemperne, thin Leaved single Crimson Violet Wind-Flower. This has as large a Flower as any of the Single Kinds, and is of an Orient deep red Crimson Violet color.

XLI. 11. Anemone tenella simplex folio, Sanguinea, thin Leaved single Blood red Wind-Flower. This is of a deeper red color than the former, but is of a deep Blood red. And there is five roots under late, another sort of the same Sanguine red, with a yellow bottom.

XLII. 12. Anemone tenella simplex Coccinea dilatata, thin Leaved single bright Crimson colored Wind-Flower. Its Flower has some Leaves round pointed, and others sharp pointed, and it is of a perfect Crimson color, some lighter or more diluted, some more red than others.

XLIII. 13. Anemone tenella simplex albo Staminata purpurea, thin Leaved single White Flowered Anemone. Its Flower is pure white, with blackish Violet Thums, in the middle. And there is one of this kind albo stamine Cornus, which has blud Vains running through every one of its white Leaves. Also another white Flowered angustifolia purpurea, which has bottoms of all its white Leaves of a purple color.

XLIV. 14. Anemone tenella simplex folio Coccinea Hispanica: Thin Leaved single Spanish blud Wind-Flower. This has a very great Flower, of a kind.
kind of dead, dull, or rotten bluish color, but yet pleasant, with blowth Thums or Threads in the middle.

XLV. 15. Anemone tenuifolia simplex purpurascens: thin Leav'd single Pale Purple colored Wind-Flower. This consists of many small narrow Leaves, of a pale Purple or bluish color on the outside, and of a like color deeper on the inside.

XLVI. 16. Anemone tenuifolia simplex Facie Tenuis: thin Leav'd single Apple-Flower'd Anemone. This in its Root and Leav is like unto the first Sort. Its Flower consists of seven Large Leaves, without any bottoms, of a white color, having edges, and some Large Stipes all of a Carnation or False color to be seen in them, marked somewhat like an Apple Blosom, and therefore it is called in Latin, Anemone tenuifolia simplex alba inforte Facie Tenuis.

IV. Thin or narrow Leav'd double flowinc AnemonEs.

XLVII. 1. Anemone tenuifolia flore pleno rubro vulgariis: Common narrow Leav'd double red Wind-Flower. Its Roots are thick and numerous, forming several small Races of Ginger, of a yellowish brown color, and neither so big nor so black, as those of the other kind with broad Leaves. It has many winged Leaves, and several Stalks, each Leaf being cut and parted into many divisions, smaller, and more divided than those of Parly, and some of them like those of a Carrot. Among which rises up one, two, or more Scarlet Anemones, but in its flower consists, with some small green Leaves about the middle of each of them, and bearing at the top, one great double flower, consisting of 6 or 7, and sometimes of more, broad wanting, like a large red color, having in the middle a large Thrum of small Leaves, of a lighter and much paler red color. Out of the middle of which, comes many larger and broader Leaves, of a lighter red than the outward Leaves, and deeper than those of the Thrum, which warmd by the Sun, spread themselves over it.

XLVIII. 2. Anemone tenuifolia flore Coccino pleno vario: Common narrow Leav'd double Scarlet Wind-Flower. Its Root is tuberous and thick, very like to the Root of Scarlet Anemone: And its Leaves are very like to the same, but not so small cut and divided, as that with the purple Flower. The flower when it first opens it is of a paler color, and sometimes of 7 or 8 broad Leaves, of a deep red, or excellent Scarlet color, the middle head being thick closed, and of a greenish color, which after the Flower has blown blown some time, does gather colors, and opens it into many small Leaves, very thick, of a more pale red color, and more Scarlet like than the Leaves.

XLIX. 3. Anemone tenuifolia flore pleno vario: The narrow Leav'd double variable Wind-Flower. It is in all things like the first (or Sect. 47.) but only in the color of the Flowers, which in this, will be of a pale bluish color, the tops of the Leaves almost white, and the bottoms together, but sometimes the Flowers will be red like the first, but striped and variegated, with pale bluish, almost white, and sometimes without any marking at all. All these diversities are found in this one kind, all proceeding from one Root.

L. 4. Anemone tenuifolia flore Coccino flustra pleno: The Double Cauliflower Wind-Flower. Its Flower is of a deep Orange color, and sometimes taller, and the outer Leaves of the French or African Marigold, and not differing from the next following in any thing else.

L. 5. Anemone tenuifolia flore Coccino pleno variegata: the Pari-colored Double Crimden Wind-Flower. This varies not in its Root, Leaf, or form of its Flower, from the second at Sect. XLVIII. but in the color, in that it will have fometimes the outer broad Leaves nari-colored, with whithit or bluish colored great Streaks in the red Leaves both inside and outside, as also divers of the middle or inner Leaves, striped in the same manner. Its Root gives fewer Flowers in some Years than in others, and sometimes gives Flowers all red again.

LII. 6. Anemone tenuifolia Eleagnaria flore pleno rubra: Narrow Leav'd more Elegant Double red Wind-Flower. Its Root is as great and thick as that of the Common Red, but flatter, and more spreading than it. It has narrower and more divided Leaves than any of the former, the Stalks taller, and the outer Leaves of the Flower more in number, and sharper pointed, of a good Crimson color, the Thrum in the middle is of a pale red, and the middle color of other Leaves large, and spreading themselves almost quite over the Flower, of a deeper color than the Thrum. Many times two Flowers will be joined together on one Stalk, which happens more frequently than in any other.

LIII. 7. Anemone tenuifolia flore pleno siccum rubens: The Greater Double Blush Wind-Flower. There is almost no difference in the Roots or Leaves of this, from the Common Double Scarlet Anemone (as Sect. XLVII.) faying that the Leaves herof are little broad, and seem to be of a little frether green color. The Flower of this is as large almoft, and as double, and the inner Leaves blusht almost as large as they, being of a white or flesh color at their first opening; but afterwafts become of a most lively bluish color: the bottoms of the Leaves abiding of a deeper bluish, and with long staming, the tops of the Leaves will turn almoft white again.

LIV. 8. Anemone tenuifolia flore pleno Coccino. Narrow Leav'd double Scarlet Anemone, or Wind-Flower. This is like that at Sect. LII. above, but that the Stalks grow not so high, and the Flowers are something smaller, which are thick and double, and of an excellent rich Scarlet color, usually called the Scarlet de Spaine. 

LIX. 9. Anemone tenuifolia flore pleno Coccino variata cama allusisse: Narrow Leav'd double Scarlet variegated Wind-Flower, with a whitish middle or thrum. This is in all things like the last, but only in the color of the Flower, which in this is of the same Scarlet color, but finely striped and marked with white; and the Thurum seeming to be almoft white. Sometimes also, the broader Leaves will come out of the middle thereof, of a bright Scarlet striped with white, like unto the outer leaves.

LX. 10. Anemone tenuifolia flore pleno cama Scabrosa: Narrow Leav'd double Scarlet thurned Wind-Flower. This differs from the last, in that the outer Leaves hereof are white, and the Thurum is of a Scarlet color. 

LXI. 11. Anemone tenuifolia flore pleno dible Nacre: Narrow Leav'd Double Wind-Flower, called Nacre. This is like unto the Scarlet, saving that the Flower is of a deeper and yellower Scarlet color, resembling that of the luther French,

Salmon's Herbal. Lib. 1.
or African Marigold, but not so deep: the Thrum is inclining to an Orange color.

LVIII. 12. Anemone tenuifolia flor plena: Narrow leaf'd double Sulphur colored Wind-flower. This differs from the last, in that the outer leaves of the Flower are of a pale greenish yellow, or Brompton-like color, and the Thrum more green.

LIX. 13. Anemone tenuifolia flor plena variata: Narrow leaf'd double green Wind-flower. This is like the last, varying in that the outer leaves are of a greenish Orange tawny color, and the middle Thrum of a yellowish green.

LX. 14. Anemone tenuifolia flor plena alba major: Greater narrow leaf'd double white Wind-flower. This differs little either in the green leaves, or fashion of the Flower, from the former, being both large and double as any of them, and of a Milk white color.

LXI. 15. Anemone tenuifolia flor plena alba maxima: The Greatest Narrow leaf'd double white Wind-flower. This is in fashion like the last, but much larger, and finer, and of a pure white color.

LXII. 16. Anemone tenuifolia flor plena alba minor: The lesser narrow leaf'd double white Wind-flower. It bears a small double Snow white Flower, having six outer leaves, and in the middle made of five small hairy leaves, standing even at the top, as if they had been clipped with a pair of Scissors.

LXIII. 17. Anemone tenuifolia flor pleno albicante: Narrow leaf'd double bluish Wind-flower. This differs very little from the last, but only in the color of the Flower, for they are both much about the same bipeds, the middle Thrum like- wise being as small and thin, and as even above, as if it was thorn for only the Flower at first opening is almost white; but afterwards the outer leaves have a more flow of bluish in them, and the middle part a little deeper than they.

LXIV. 18. Anemone tenuifolia flor pleno purpurea Violacea: Narrow leaf'd double Purple Wind-flower. This double Purple Anemone, is of the fame kindred with the Double Scarlet, at Sed. LXVIII. alioque, having the same form and double blossoms of the Flower, consisting but of six or seven leaves at the midst of (in our Country, the in hotter Climates, it has 10, 12, or more as large leaves) for the outer Border, and as large leaves for the inner, being both small, and all small leaves for the inner of the three, and all of a deep Purple, tending to a Violet color, the outer leaves being not so deep as the inner. Its Root and Leaf comes near to the Single Purple Anemone before described, but its Root spreads not so much.

LXV. 19. Anemone tenuifolia flor pleno purpurea Corallo: Narrow leaf'd double Blush Wind-flower. This differs not in any thing from the former double Purple, but only that this Flower is paler, and more tending to a bluish color.

LXVI. 20. Anemone tenuifolia flor plena Columbina: Narrow leaf'd double bluish Columbine Wind-flower. It has a larger Flower than any of the former, the outer Leaves being long and broad: The Thrum is composed of short narrow Leaves, putting forth a great Tube of longer and broader Leaves, which spread over the Flower, almost to the points of the outer Leaves. The whole Flower is of a bluish or light color, like to that which is seen in the Flowers Columbine, whence came the Name.

LXVII. 21. Anemone tenuifolia flor plena Roso: Narrow leaf'd double Rose colored Wind- flower. It has smaller flowers than the last, but flower. It is rather taller, and of a more lively color, like that of a new blown Damask Rose. It differs in nothing from the Columbine Anemone, at Sed. 66. above, but only in the Flower, which is something smaller, and not so thick and double as that is, this being of a reddish color, near to the color of a pale red Rose, or of a deep colored Damask.

LVIII. 22. Anemone tenuifolia flor plena Roso variata: Narrow leaf'd double variegated Rose colored Wind-flower. This differs from the last only in this, that the Flowers hereof are stried and variegated with white, especially in the outward Leaves.

LIX. 23. Anemone tenuifolia flor plena Careno Variegata: Narrow leaf'd double Carnation Wind-flower. This is in its Root, Leaf and Flower, comes nearest to the former double white Anemone, at Sed. 63. above: in respect to the magnitude and duplicity of the Flower, and in the smallness of the middle Thums, and their evenness at the Tops: It is not so large and great a Flower as the Double Purple, at Sed. 64. either in its inner or outer Leaves, but yet it is very fair, thick and double, and of a most lively Carnation Silk color, very deep both on the outer Leaves, and middle Thums; and withal so fine, that as well it delights the Mind of the beholder, so it fills it with a kind of amazement, by reason of its excellent appearance: Yet by long standing in the Sun, it grows paler, and its colors away, so as all the other Beauties of this kind.

LX. 24. Anemone tenuifolia flor plena rubra monstruosa: Narrow leaf'd double spotted Blood colored Wind-flower. It is made up with a tall Stalk bearing a large Flower: the outer Leaves whereof are almost white, marked with small red dith spots and marks, especially on the outer side. The Thrum is large and thick, composed of many long narrow, tharp pointed Leaves, of a reddish or Peach color, poudered with small spikes of a deeper red color. This is called by those who brought it out of Flinders, The Perfect-Carnation.

LXI. 25. Anemone tenuifolia flor rubroflora pleno comus Amarantina: Narrow leaf'd double purple Velvet Flower. It is in all things like to the double Carnation, at Sed. 69. above, but something larger. The difference consists chiefly in the color of the Flower, which is in this of a deep or mid Carnation red color, for the outer Leaves, and of a deep purple Velvet like in the middle Thums, resembling the color of the latter Amarantus purpureus, or purple Flower-Gentle, (from whence it took its Name:) which middle Thrum is as fine and small, as even at its top, as the double white or Carnation Anemones, at Sed. 62. and 69. aforegoing.

LXII. 26. Anemone tenuifolia flor pleno tricolor: Narrow leaf'd double three colored Velvet Wind-flower. This is very like the last described, living, that in the middle of the purple Thums, there comes forth a tuft of Threads or Leaves, of a more light Carnation color.

LXIII. 27. Anemone tenuifolia flor pleno purpurea: Narrow leaf'd double purple Wind-flower. It comes up with green Leaves commonly before Winter, and many times with Flowers; and therefore for the prevention of such forwardness, the Roots are to be kept out of the Ground, and not to be left till November, which causes them to bear the firher Flowers in the Spring following, which will be very large, thick, and double, of a faded violet Purple color.

LXIV. 28. Anemone tenuifolia flor pleno Lavenzonia color: Narrow leaf'd double Lavender colored Wind-flower. It is in all things like the last, but the Flower is feeter, and of a pale heavy
Salmon's Herbal.

LXXXI. Баунуфіс: white leaves with Carnation bottoms, the Thrum white Carnation and Limon. Біле, white and Carnation leaves, the Thrum salt Carnation. Білі, it is an All White, mix with Carnation.

LXXXII. Сассауа: Grey leaves with Carnation bottoms, and Thrum Carnation tips with a greenish Hair color. Гістрове, the leaves Crime, bordered with a yellow Brinifrome color, and the Thrum deep Scarlet, Сореде, the leaves white, and the Thrum white tip with Limon. Селідь, the leaves white and Carnation, the Thrum Rote color. Чіта, it consists of Blush, or Fush color Carnation.

LXXXIII. Домауна: Carnation and White perfectly marked. Демпіе, the leaves are Carnation and white, and the Thrum of a reddish color.

LXXXIV. Экстрожан: Its Leaf is variegated with white, red and green colors; its Thrum being of a strange form.

LXXXV. Трібі: It has white leaves, and a Thrum green, mixed with White and Carnation. Галліфіс of Тібіозе, the whole flower is all Scarlet and White. Гейта, the first Flowers are white and Purple, the later Dove color and Peach.

LXXXVI. Хересі: Its leaves are of a Carnation color, sometimes marked with white, and the Thrum Scarlet.

LXXXVII. Філіат, the leaves are Flesh color and Clipin, and the Thrum of a Brick color. Філіату, the leaves are of a Blush or Fush color and Carnation, and the Thrum reddish. Філіату, the leaves are of Carnation and White, and the Thrum Carnation color only.

LXXXVIII. Лимагіні, it is very much like to the Extragovan, at Sect. LXXXV, abroging. Лімогін, the outer leaves and the Thrum within, are of a whitish Gray, with Dove-colored bottoms; and the Thrum is Dove color right to green.

LXXXIX. Монтіурс, the leaves are Limon color, with Carnation bottoms. Меліфур, the leaves are a deep Scarlet with white bottoms. Меліфур, the leaves are all of a dirty Gray, mixt with Green and Carnation. Мерін, the Flower is all gray, mixt with Carnation. Мерін, the leaves are of a Blush or Fush color, and the Thrum white tip with red.

XC. Натілія, the leaves are Carnation and White, and the Thrum the same. Наурон, its leaves are of a Carnation color, and the Thrum Carnation and almost black.

XCI. Орієнтал, its leaves are of an unusual color, viz. a blew Gray, much like the color of our Common States with which they cover Houses.

XCII. Парізон, it has white leaves with red bottoms, and the Thrum is Limon color, which at first is almost white. Прион, its leaves are white with red bottoms, and the Thrum is a mixture of Rose color, Carnation, and Light Hair color. Прион, the Flowers are all white, and Peach color. Франціосі, the whole Flower throughout is a pure white and each color.

XCIV. Варіа Цоло, or Amaranthe Regala, it is of four sorts, viz. 1. One with Crime leaves fithe right with White, and its Thrum a salt Murry, with a red Tuft in the middle. 2. One with Crime leaves, a salt Murry Thrum, and a Scarlet Tuft tip with White. 3. One with white leaves, mixt with some Crime, its Thrum Murry, and its Tuft in the middle Carnation. 4. One with Crime leaves well fringed with white, the Thrum Murry, and the Tuft Carnation.
The Culture

I. Of the Preparing the Earth.

XCIX. In the managing of the various sorts of these Beautiful Flowers, very great Care is to be taken, that the Soil or Earth, Situation or Place, Time or Season, and the way and manner of their Planting and taking up, be exactly observed; otherwise your Flowers will neither be fair, nor the Roots prosper and increase, but rather rot and consume away; especially all the above Double Flowers of the Tentofolias, the ordinary Flowers, and Single Flowers, are more hardy.

C. The Soil is then frifly to be considered, which must be Fair and Rich, and not too light; a Rich Sandy Loam Earth is fit for beft, in which some Nears and Sheep’s Dung, with a little Lime has been tempered, and lain long on a heap, and often tur’d over, so that the Dung be fully rotted, and well mixed with the Earth, which being frifly Sifted thro’ a Wier Sieve or Skrean, you may thence make a Bed thereof half a Yard deep at leaft, in some place which is not in too hot a Sun, but a little shadowed.

Cl. Or, make five equal Heaps of yellow Sand, three others as large of Kitchen Garden Earth, and four others of Bed-Mould well mallowed; then mix them altogether with a Shovel, make as much of this Earth as you shall have occasion for, which let be a Year old before you use it; during which time, call it once every Month thro’ a Skrean, that it may thereby be thoroughly mixed and petrified, left its too Soft lust (which might hurt the Beauty of your Flowers) should be retaining, which by this means are made of a firmer and firmer kind.

CII. But if you cannot well lay fo long as a Year for the well fitting your Earth or Mould, you may then provide the Earth as in the former Sect., and after a Months time use it for the first time; but then you ought always to have a good quantity more of it in reserve, ready prepared as aforesaid, a Year before hand. The more this Earth passes thro’ the Skrean, the lighter it will be, and more agreeable to the Nature of Anemones.

CIII. Before this Artificial or made Earth be laid upon the Natural Soil of your Garden, the Ground ought to be before hand prepared. The Earth of your Garden be naturally light and sandy, or Gravelly, you need not do more but dig it up, and cover it about half a Foot thick with this your Artificial Mould; but if your Garden Ground is Wet or Moiſt, (both which are injurious to these Flowers) you must dig the Bed you design for these Flowers, and take out about a Foot and half deep of the Earth, and then fill up the hollow Capacity thereof, with a Compound of half Sand and half Artificial Mould, in which you shall Plant your Anemones as shall soon be directed.

CIV. Instead of Mould, you may make your Beds of rotten Herbs, Leaves and the like, which mixed as is before directed, and put several times thro’ the Skrean, will make a Compoſite Earth, as fit for Anemones as can be desired; which you may lay upon your Compartments or Beds, after it has been well Sifted or Skreained.

II. Of the Times of Planting of Anemones.

CV. The best Season for Planting Anemones, is from the middle of September to the middle of October; but if you have a mind to have them in Flower a great part of the Year you must Plant them in March and April, but you are not to expect such fair Productions from these last as from the first, where the Sap has had a primary advantage.

CVI. And this seems to be Parkinson’s Secret, to teach us how we may so order Anemones, that after all others are commonly past, we may have them in Flower for 2 or 3 Months longer than they are otherwise to be seen. The ordinary time (by’s he) to Plant Anemones, is in August, which will have Flowers, some per chance before Winter, but most commonly in February, March and April, few or none of them abiding until May; but if you will keep some Roots out of the Ground unplanted, until February, March and April, Planting some at one time, some at another, you will have them bear Flowers according to their Planting.

CVII. Thofe (by’s he) which you Plant in February, will Flower about the middle or end of May, and so the rest accordingly after that manner. And thus you may have the pleasure of those Plants out of their Natural Seasons, which is not permitted to be enjoyed in any other Flower that I know of; Nature being not so prone to be furthered by Art in other Plants as in this.

CVIII. But this is to be observed, that when you keep your Roots out of the Ground for this purpose, that you must be very careful in laying them up and preferring them; that you keep them neither too dry nor too moist, that they may neither shrivel nor rot; and then in Planting them, you put them not too open or Sunny a Place, but where they may be a little shadowed.

CIX. The Latifolias are generally Planted early; or in the first of August and September. The Anguifolias or Tentofolias, are ever Planted after them, later in the Year, being kept out of the Ground (in some proper dry place) till the end of October, and the Purples a Month or two later, in the same manner as the others. The Latifolias or Broad Leaf’d, will come up before Winter. The Anguifolias or Tentofolias, the Nat-
III. Of the manner of Planting

CX. The Beds or other places being prepared, and made even and smooth with the Rule, take a long Rill, or little hollow Line or Gutter, from one end of the Bed to the other: This done, extend your Cord, and do in like manner again, a second, third, and a fourth time, or more, according to the breadth of your Bed, at 5 Inches distance, (Mr. Rea says 6 or 8 Inches) abunder from each other.

CXI. This done, take up your Cord again, and place it in like manner, to draw Rills or Gutter cross all these Beds, from one end to the other, and all of them equally at the aforesaid distance, of 5, 6, or 8 Inches, by which means you will form a regular oblong Parallellogram, in which, either in the middle of each Square, or in the points where the Lines cross one another, you are to plant your Anemone Roots, which being at an equal distance, will when they come to blow give you a singular pleasure, which will arise from their great variety of colors, and their regular order of Planting.

CXII. When you are going to plant the Roots, make a hole for every one of them with your Finger, or an iron made for that purpose; which let not be above 3 Inches deep in the Ground, and extend the Root always upon the largest side of it, with the dirt downwards, to the end that the Pabulum, or nourishing Juice, may rise directly into the Root, to cause it to spring, to as to advantage your Expedition.

CXIII. Or as Mr. Rea says, put the Root into the hole with that side of it upwards, where you perceive small Eminencies to put forth Leaves. The Lathyrus and Trefablous, or Trowflous, are to be planted in the same manner, only differing in the Times of their Setting or Planting, as we have them in Set. 1. 109. aforegoing.

CXIV. Anemones are not Planted in open Grounds, but they are sometimes put into Pots, one or two or more Roots into each Pot, (according to the magnitude of the Pot) and this because, that if any of the Roots should chance to fail, there may be found in these Pots what is wherewithal to fill up the vacancies.

CXV. This failure (if any be) will be perceived about three Weeks after you have put your Roots into the Ground, and which does not always proceed from a corrupt Root, but sometimes is occasioned by the Pabulum or Sap's not rising to kindle as it ought: You are ever to look for such a Root in less than a Month, and you will sometimes find them in your Pots also, as well as in your Beds.

CXVI. The Flowers require to be Planted in an open place, and dry, they ought in a shady, because, finding forth a great many minute Threads or Strings, and large ruts of Leaves, they would be apt to spread themselves too much, if so placed; and if caused a weakness in their Stems, and hazard their proving Abortive, or altogether to yield but a few Flowers. And the Stalk being thus reader, would certainly be killed by the Cold, which they would be too incapable of in this case, which would do a great damage to the Root it self.

CXVII. If the Autumn be dry, you must take care to Water them well: but contrariwise, if it rains very much, you must then defend them from too much moisture, (which agrees not with them) with screens of Straw. They may be water'd from the Month of February, to the times of their Flowering, which how much, or how seldom it is to be done, experience only must tell you.

CXVIII. The Cold is no mortal Enemy to them, yet when it happens to be very severe, the Plants ought to be covered with long Dry Dung, or long Straw; and your Pots ought to be also Planted or Placed, where they may be most safe from the Weather.

CXIX. Then again when the Weather grows cold, you may uncover them; but thus, you must be sure to cover them again, if it changes to be Cold again. In sum, your prudence and experience must excite your industry, and direct you, when, how often, and long you must hew this trouble upon them.

CX. If at any Season of Planting or Setting your Roots, you put a little Willow Earth under and over the Roots, it will cause them soon to put forth Fibres, and thereby make them able to abide or endure the Winter. Yet in Frosts and hard Weathers, it will be good to cover them with the graves up (as aforesaid) with Moss or Peals Straw, which you may make for two or three hours, every other day, (if fair, and the Sun shines, and there be no prevailing North, North-east, or Easteast Winds) to give them Air, and prevent Mouldiness (which is apt to happen to them, and which has been the ruin and destruction of many a fine Plant, from which you might have expected very admirable Flowers.

IV. Of Crowned Plants for Seed.

CX XI. There is some special choice to be made of such Flowers whose Seed is fitst to be taken, as the Latirus or Grey Willow, and the Trowflous, or Trowflous. The Latirus being Sown, yield many pleasant varieties, but the Poppies, Reds, or Crimson, whether Latirus or Trowflous, yield small or few, but each solitary as draw near their Original, tho' it may chance some of these may be a little deeper or lighter than others.

CX XII. But the light colors are those, which are to be chosen for this purpose; as White, Yellow color, Bough or Caravon, Light Orange, fimple or part-colored, fingle or double, (if they bear Seed, as sometimes they do.) Those are they whole Seed you are careful to gather, but not before it is thoroughly ripe, which you may know by the head.

CX XIII. For when the Seed with its Woodlin begins to rise a little of it fall at the lower end, it must then be quickly gathered, lest the Wind carry it away. After it is thus carefully sav'd, it must be laid to dry for a Week or more, which then being gently rubbed with a little dry Sand or earth, it will cause the Seed to be some what better separated, at least not throughly, from the Woodlin or Down which accompanies it.

CX XIV. If there remains any Woodlin in the Seed, put it among the other, and so may be perfectly separated, for unless this be done, it will be impossible to Sow them in the
Chap. 738. English Herbs. 1269
due order, which the Nature and Quality of this
Plant requires.
CXXV. For the raising of new Varieties of
Anemones from Seed, choice must be made of the
Flowers (as Mr. Rea fays) as in Tulips, some of the
Double Leaved's being mixed with the single Scar-
lerts, paled Purples, Pink colored, White and Sky
colored are the best.
CXXVI. But in the Single Anemophilus, or
Tenuifolia, there is more choice, as Red and
Scarlets with deep white edges, all that are vari-
egated or striped with White, and in thefe, the
deeply Velled Purples are the best: But above all
others, thofe which have 2 or 3 Rows of Leaves, and
that excellent Single Velvet Blues, are chiefly to be prefer'd.
CXXVII. In fower, to have good Seed, you
ought to pitch upon Single Anemones which have
flrong Stalks, and proportioned in height to the
largenefs of the Flower, and which have long and
round Leaves, for thofe kinds of Flowers never
degenerate, and therefore it may be in a manner
certain, that if Nature, the Seafton, and the Soil
favour us, they will give us a produce of very fine
Flowers.

V. Of Sowing the Seed.
CXXVIII. The Seeds of thofe Flowers will be
ready to be gathered in May, which muft be done
as the Down rifes, elfe they will be all blown a-
way, and having gathered all your Seed, dried
and cleared them from their Down, as directed at
Seed. CXXIX. above, or by mixing with them a
fufficient quantity of dry fine Sifted Earth, and in
a Bowl, Troy or Bayon, fltering and mixing them
with your Fingers fo long, till none of the white
Down appears; you are then (not to flay till Aug-
uft as fome French Gardiners direct,) but to Sow
them about a Month after as Parfinglon advifes, or
not exceeding 6 Weeks, or the middle of July at
moft, as Mr. Rea fays.
CXXX. Then be fure the Earth in which you
Sow them be good, and finely Sifted, and let the
Ground be made into Beds as before direcdt, or
put into Boxes or Pots, if you defign them: This
Ground muft not be a too fmall Clay, nor too light
a Sand: if not fit for the former, it muft be
prepared, and may be conftructed thus. The
Earth is to be mixed with Brook-Sand and Pearl
Sand, and good Sift'd Earth, taken from near
under the Turf of some good Parks, which with
fored New Earth well rotted to Earth, and four
Line, are to be well mixed together, and be-
ning dry, to be often Sifted or Srote'd over, that
the Mould may be made very fine.
CXXXI. With this Mould thus prepared, you
may make Beds, or as aforefaid, upon which you
are to Sow your Seed rationally thin, and not too
thick; (for also in Boxes or Pots,) let the top of
the Bed, fce, be firft made very plain and fmoofh,
then your Seed being Sown upon the fame, you
frew or Sift over them, fome fine good Sift'd
Mould, covering them about an inch thick at mat
for their firft time.
CXXXII. About a Month after their firft Sprin-
ging up, Sift or Srove over them again another inch
thicker, and done in the fame manner; And in a mean time, if
the Weather proves dry, you must Water them
gently and often, but not to overlarg them with
moifure, and thus doing, you will have them
Sprung up well, and grow pretty strong,
able to with the sharp Seafton in this their fo-
ter Age, efpecially if you take a little care to co-
ver them loofely with fome Peas, Straw, Perf-
Straw, Hay or the like, while they are very
not too far off, being laid over them upon
Sticks.
CXXXII. But in your Sowing the Seed, tho'
y are not to Sow them till the end of April, you ought
not to err on the other Hand neither, in Sowing
them too thin, because many of them may mi-
carry, and never Spring up, which being covered
as aforefaid, about an inch thick, with fine Sifted
rich Earth, and fo to be farther ordered as in the
former Section, will not fail to answer your Ex-
pectations.
CXXXIII. Some in Sowing the Seed, do it
after this manner, (the Bed being before hand
prepared) they take the Seed and put it into a Leather
Bag, and cloathing up the whole, fo as only three
Fingers may enter in, you may pref with the Bag with
one Hand, and Jack, or a little shake it with the
other, fo will the Seed spring out, in fuch a man-
ner as it ought to be Sown, moving the Bag up and
down over the Bed, both long way and eatherly,
that each part may have its Share of Seed.
CXXXIV. Which done, and fine Earth being
Sifted over it as aforefaid, immediately throws the
whole Bed thirty over with long Straw, and ftreth
with Water it with a Watering-Pot, which let be
pretty confiderable, but afterwards left, because
too great a Quantity of Water would not the Seed,
and fo totally defroy it.
CXXXV. After 15 or 20 days, take off this
thin Sifted Straw. It may be the Seed may be
begin to Sprout in that Space of time, or fooner:
but if they shoot not for 5 or 6 Weeks time, be
not confider'd, for they may yet grow well
enough.
CXXXVI. The French Gardiners fay, that if
the Seed be well Sown, and great care be taken
in Cultivating it, that you will not fail of Flowers
in March following, or in April at farthest,
because fce, when the Seaftons begin to wither,
and their Roots are dillplanted, the Bed where
they are, is to be dig'd thro' three inches deep,
and the Earth as foot as it is call'd up, to be laid
upon a Linnen Cloth or Canvas, till fuch time as
the hole be dug, which is then to be cabmled,
and sifted, or fere'd on a hollow Bed, till fuch
time as there remains above Ground only the
Range of thofe young Anemones, which are
then fowed, and called Peas, because they reftamine that Pafe
in form and magnitude.
CXXXVII. Parfinglon fays, the Seed being thus
cared for, that the Plants will bear Flowers the
Second Year after Sowing, and moft or all of them
the third Year, if the place where you Sow them
be not annoy'd with Smock of Brooders, Dyers,
Malt Kilns, or other Inconveniences, which if
they be, they will never thrive well.
CXXXVIII. Mr. Rea in his Flora, page 128,
fays, that fome report that they have had Anemo-
nes bear Flowers the next Year, and others, the
Second Year after Sowing. But I (fays he) can
exempt few or none that are good before the third
Year, and many will not bear until the
fourth Year. But the carefullness and goodnefs
of the Earth and Air, for bringing them forwards
is molt confiderable; therefore you ought to be
fure to make it as rich (for the kind) and as
good as you can, taking heed of either Sifting or mixing
with the Mould too much Dung.
CXXXIX. Thofe Peas aforenamed, at Sift.
13. above, being gathered, are to be laid in a
Day place, as carefully as poftibly may be
and kept in a dry place, as carefully as poftibly may be
and kept in a dry place, as carefully as poftibly may be
till September next, when (new Beds being
made for Planting Anemony Roots) they are to
VI. Of the taking up the Roots.

CXL. Parkinson says, that the next Spring after Sowing, you may if you will remove them, but he also says, it is better to stay till August, and then make the Remove, when you may let them in order by Roots, with sufficient difference one from another, as is before directed; where they may abide until you for what manner of Flower each Plant will have, which you may afterwards better judge of according to your Mind.

CXLII. As to the Anemones rifulled from the plantin of their Roots, if they like their Entertainment grow strong, bear fair Flowers on tall Stalks, and other wise, you may forbear to take up their Roots until the end of June or July. But on the contrary, if the green Leaves are few, the Stalks short, and the Flowers fmall, it is a manifest sign off danger, and that the Soil is too cold and poor, or else too hot and rank, which is far more dangerous.

CXLIII. In this cafe, they must be taken as soon as the green Leaves turn yellow, and the Roots are to be put into Sand, and so kept in some dry place for a Month at leaft, and then taken out and put into Papers, in some cool dry place, until the time of Re-planting; For should they remain in the Ground any time after they have left their Fibres, the Earth being unfittible, they would all or most of them rot and consume away, especially if any fome of Rain should fall upon them.

CXLIV. In taking up their Roots, you must take care that they be not broken, especially the Laetifolia's; which must not be divided nor broken, until they part of themselves. The Angelisfolia's or Teresifolia's, may be broken or parted with less prejudice; but the wholer they are kept, the better they will thrive.

CXLV. And the 'tis mentioned in some of the former Sections, be best for planting or fearing thefe Roots, of both kinds of the more excellent and rare of these Flowers, yet the more ordinary kinds, may be kept out of the Ground till the end of February, which fome do, to caufe them to flower later, after the other finer and rarer kinds are gone.

CXLVI. In this cafe, it will be good to feep these long kept Roots 24 hours in warm Water, before you Plant or Set them; and then to Plant them with some Willow Earth under and over them, and in a more shady place than ordinary; because the heat of the Sun, in the time of their flowering, will much diminish their beautiful appearance.

CXLVII. If then you have two Beds florid with choice varieties of Anemones, let the latter which are Set, be more thady than the firft, and so gradually as they are later in Planting; and then if the aforementioned Rules be observed, you will be sure to have admirable Flowers in part of March, and all April, and the greatest part of May, unless your Garden land in some Smooth or ill natural place, where neither Art nor Industry can make them prosper; unless they be Set in a hot Bed, as some in and about London commonly do.

VII. Of the Choice of Plants and Flowers.

CXLVIII. The Beauty of this Flower consists in its largeness, roundness, and fine colors, to which in the double kind add its duplicity completely; especially with its great Leaves, exceeding a little the bigness of its Tuft: and the extremities of its largest Leaves are round, as well as tho' of its Stalks, which ought to be large and not narrow.

CXLIX. That is a fine Plant whole Stem is proportioned in height to the largeness of its Flower, and is strong enough to bear it up without bending; also whose Leaves are worthy, its Tuft low and bafhly, representing a kind of Cupule; and wish'd has a great many Stalks or Flowers.

CLI. If the Pointed in the middle ought to appear a little, and be as it were upon a level, with Leaves of the Flower, of an indifferent thickness, for if it is too thick it is a defect; and it ought to be in something a different color, from the great Leaves and the Tuft.

CLII. There are some Anemones which are apt to shoot up into height, so that instead of Flowers, they only produce Leaves, and this comes from having such a great number of productions on one very fide, which draw away the succulent and nutritive Juices and Salt of the Earth. This great abundance of Leaves you may readily, by clearing the Plants of them as are as near the root of the Plant receiving so much of that fucculent Nutrition, will make it better to produce its Flowers.

CI. If the Anemones should grow moulty at that part of the Root from which they flower, (which is their Oldeft part) give them a filly with your Finger on that part, and if they found hollow, or have little holes, then you may take a Knife and pare away that decayed part to the quick, smoothing the place where you make the Incision, for fear that if any hollow should remain, some of the putridity may mix behind, which may make the Root fall into the fame Depredation again; which when the decayed part is cut quite away, new Roots will shoot forth, which will give you Flowers in great abundance.

CLIII. In doing this work, many Roots or Segments of Roots you may cut off; these you ought not to throw away, but to Re-plant them again, for many times those off cuts being Re-planted, will admirably revive, grow strong, and bear very good Flowers.

CLIV. But in the Roots where you have made the Incision, to Soon as ever they are dry, you must rub them in the wounded place with a mixture of melted Sapin and Wax, which being well fixed on them, will hinder them from further corrupting.

CLV. And as it is to be obser'd, that the Seed only, or chiefly of the Single Anemones, bring forth Double ones, to the Double Anemones fallum or never multiply, but by the Fangs of their Roots, which are confined in their production, and never found to degenerate.

CLVI. We have given you the Names of the principal kinds of above four score various sorts of these Flowers, and 'tis possible, there are an hundred other sorts, with Names imposed upon them,
of Winter-Green.

Winter-Green.

The Descriptions.

III. The First, or our Common Winter-Green. Its Root is thinner, small, creeping, compact of many small Fibres, or slender Strings, from which some of them, 4 or 5, or 3, or 2, or a Lance, standing on a long foot stalk, which are almost as broad as long, round pointed, of a sad green color, hard in handling, and something like to a Pear-Tree Leaf, (whence the Name) or as some will have it like to the small Leaves of Wild Beets, whence comes forth for the most part but one (but sometimes two) slender weak Stalks, yet standing upright, bearing at the top many small white Flowers, feshnet or sweet as those of the Lily Cornell, laid open like a Star, consisting of 5 round pointed Leaves, with many yellowish Threads in the middle about a green head, and a long Ripe with them, which in time grows to be the Seed Pellet, which when it is ripe, is quinquangular, or five fided, with a small point at it, in which is contained Seed as small as dust it self.

IV. The Second, or Winter-Green with Chickweed Flowers. Its Root is made of many small Fibres, proceeding from a small round head. It rises up with one or more, broad round Stalks, 6, 7, or 8 inches high, almost bare of Leaves for a space next to the Root, or at most with but a or 3 very small Leaves, yet one a little above another: but at the top thereof, round the Ring of Leaves, something long, and pointed at their ends, something like to a Pear Tree Leaf, but longer and not so round; being many of them at head and half head long, or more, tender, smooth, green, having one middle Rib, with divers Veins in the Leaf, finely dented about the edges: From among which Leaves, rise up weak foot Stalks, rather than Stalks, about 3 inches long, finishing 3 or 4 Flowers, each by it self, made of six white pointed Leaves spicet, Star fashion, something like a Chickweed Flower, but larger, with several small yellowish Threads in the Middle, which being ripe, there comes in place a small round head, smaller than a Coriander Seed, containing within it divers small black Seed, covered with a thin white Skin.

V. The Places. It both grow Winter and Summer, and Flower in the Months of June and July.

VII. The Qualities. They are Cold in the second degree, and dry in the third, Attenuative, Astringent, and Vomitive.

VIII. The Specification. The fist which is only or chiefly used, as it is exceedingly Astringent and Glutinous withal, so it is a speedy Cure for Green Wounds, as also for all inward Wounds and Bleedings: it stops all Fluxes of the Belly, whether of Blood or Humours, the Bleeding of Wounds, and the overflowing of the Tumours in Women: It also Cures old running Sores, putrid Ulcers, Flibbert's, and the like.

The Virtues.

X. The Liquid Juice. It coagulates Green Wounds, uning their Lips speedily together; and taken inwardly 2 or 3 Spoonfuls at a time in Wine and Water, it stops inward Fluxes of Blood, and Cures inward Wounds: it stops the overflowing of the Terms in Women, Cures Spitting and Vomiting of Blood, the Hepatic Flux, Bloody Flux, and all other Fluxes of the Bowels. It is said to Cure Ulcers and Wounds in the Reins and Bladder, Womb, and other secreter parts, as also Ulcers and Fistula's in any other part of the Body, being inwardly taken and outwardly applied: not being inferior to Agrimony, Awert, Betony, Burnet, Comfrey, Daisies, Golden Rod, Hops, Hops Roots, Periwinkle, Sanicle, Tormentil, or other Herbs of like kind.

XI. The Decoction in Wine and Water. It has all the former Virtues, but not altogether so powerful; and may be given Morning and Night, from 3 Ounces to 4, sweetened with Syrup of the Juice of the Lime. It heals inward Ulcers in the Reins and Bladder, and hinders inflammations, being fomented upon any part affected.

XII. The Balsam or Ointment. It is made with Hogs Lard, or with Oil Olive, Bees Wax, and a little Turpentine. It heals all manner of Wounds, and Sores: the Germans use it very much, and extol it beyond any other Balsam made of a simple Herb. It is no less helpful for Ulcers and Fistula's, hard to be Cured in what part of the Body soever, and heals Cankers of the Mouth and Gums.

XIII. The Cataplasm of the Green Herb. It is Affringent and Glutinous withal, and a singular remedy to be presently applied to simple Green Wounds, to coagulate them. It also gives ease in the Gout, and abates the Tumor.

XIV. The Distilled Water. It has all the Virtues of the Juice and Decoction, but much inferior in Virtues and Effects; and therefore may be used as a Vehicle to convey the other Medicines down in. But it may be given of it half for the same purposes from 2 to 6 Ounces, sweetened with Syrup of Comfrey, or Syrup of some of the other Condimentaries.

XV. The Powder of the Herb and Flowers. It may be given in all the same purposes in the Decoction, Distilled Water, or some proper Syrup, or in Honey, from 3 Scrupules to a Dram, or Dram and half, Morning and Night.

CHAP. DCCXL.

Of Woad, Garden and Wild.

I. The Name. It is called in Greek, Ἰττᾶς; in Latin, Gledium and Ittae also; and by some Gaddum; and in English, Woad.

II. The Kinds. We have but two Kinds here of: viz. 1. Ἰττᾶς ἰττᾶς: Gledium Ittae, Ittae fariæ: Our Manured Woad. 2. Ἰττᾶς δύοδας: Gledium Fytther, Ittae aggress: Wild Woad.
Chap. 740. English Herbs.

has divers large, long, and something broad Leaves not much unlike to those of Ribwort Plantain, but larger, thicker, and of a darker bluish green color. From among which rise up, one or two strong Stalks 3 or 4 feet high, and sometimes more, with divers such Leaves set thereon, but smaller as they approach up to the top, where they spread themselves out into many Branches: at the ends whereof grow small yellow Flowers, in whose place come long flatish Cols or Pads like Tongues, black when they are ripe, and pendulous, or hanging downward, wherein lie the Seed, which, if it be a little chewed or broken with moisture, will give a blue color.

IV. The Second, or Wild Woad. It is very like unto the former, in its Roots, Stalks, Leaves, manner and fashion of growing, fancying that the Stalk is

Woad Wild.

V. The Places. The Manured Woad is Sown in Gardens, and whole Fields are Sown with it in England, France, Germany, Italy, and Spain, as also in the Islands of Tercera, belonging to Spain. The Wild in Fields and Untilled Places in England, Germany, &c. where the Manured has been Sown.

VI. The Times. They Flower in June and July, and the Seed is late Ripe, viz. in September or October.

VII. The Qualities. The Manured Woad is hot in the first Degree, and dry in the second, bitter withal, but not sharp. The Wild is as hot, but more drying, viz. in the third Degree, and is more sharp and biting, exceeding the Manured in all its properties: they are Antifever, Astringent, and Venerary.

VIII. The Specification. It is good against the Obstruction, Pain, and Tumor of the Spleen; and is proper for the Cure of simple Green Wounds, and Ulcers.

IX. The Preparation. You may have therefrom, viz. from the Herb, 1. A Liquid Juice. 2. A Decotion in Wine or Water. 3. A Balsam. 4. A Distilled Water. 5. A Powder of the Herb.

The Virtues.

X. The Liquid Juice. It is binding and very drying, refits Purification, Stops Bleeding of all sorts, whether inward or outward, by the Mouth, Nose, Fundament, or private Parts; and therefore is profitable to stop the overflowing of the Terms and Loches in Women: used to Green Wounds, it floods up their Lids and quickly heals them; and is no less profitable to cleanse and correct the putridity and malignity of old running Sores, and eating Ulcers, rebellious Fistula’s, panniculous Cancers, and the like, being outwardly applied and inwardly taken, from 1 Spoonful to 6, (according to the Advice of the Physician) Morning and Night, mixt with a little Wine, or Wine and Water, or other in Vehicles; and so taken, it is good to open the Spleen, ease its Pain, and to difcuss all hot Tumors thereof.

XI. The Decotion in Wine. It has all the former Virtues, tho’ not altogether so powerful, and therefore may be taken Morning and Night, from 2 to 6 Ounces; and outwardly applied to simple Green Wounds, old running Sores, foul Ulcers and Fistula’s, to wash and burton them therewith, it Absterges or cleanses, and induces their healing: but particularly helps the hardness of the Spleen being Drunk, and the Region thereof being also fomented therewith.

XII. The Balsam. It is of singular use (being applied) for the Curing of simple Green Wounds, and cleansing, incarnating, drying and healing, of old running Sores, malign and purulent Ulcers, and rebellious Fistula’s, &c.

XIII. The Distilled Water. It has all the Virtues of the Juice or Decotion; but as it is much weaker, so it must be taken in much greater quantities, and is best to be used mixed with either the Juice or Decotion.

XIV. The Powder of the Herb. It may be given from half a Dram to a Dram, Morning and Evening in a Glafs of Wine, or Wine mixed with the Distilled Water, or in the Decotion aforesaid, to all the purposes said. It is good against the Bloody-Flux, as also all other Fluxes of the Belly, or Defluxions of Humors upon any part, vehement Catarrhs, and the like.

XV. The Decotion in Water. It is used by Dyers to Dye Cloth, Wool, Yarn, &c. of a blow color, by Boiling the matter to be Dyed therein.

C H A P. DCCXLI.

of WOODROOF:

0 R,

WOODROWEL Common, Blow, and Break-Stone.

I. THE Names. It has no known Greek Name, but in Latin it is called Asperula, and Asperula, and in English Woodroof. 7 2
II. The Kinds. Those which are most known to us, are the three following, viz. 1. Aperula Do-
droni & Lobhij, Aperula odorata Clefji, Aper-
gula odorata mistia Penci, Aparina Sylvestris
gracilis Cordis, Rubia Sylvestris sua minor Græeri
Spicatae Sylvestri Tibernionemonti, Our Com-
mon Woodroof. 2. Aperula Alba Cerata Eadoc-
ni, Camerarii, Lobhij & Lugudonensis, Aperula
Cerata arvornia Bubhini, Woodroof with a Blew
Flower. 3. Aperula repens, Juncaria Salmati-
cenfis Clujii, Synanchic Species Lugudonensis,
Juncaria Tibernionemonti, Rubia linifolia aepro
Bubhini, Small Break-Stone Woodroof, or Wood-
roof Stone-Break.

III. The first, or our Common Woodroof. Its
Root runs and creeps under Ground, and shoots up
new Stalks round about it every where. It sends
forth several square Stalks half a Foot high or more,

Woodroof Common.

full of Joints, and every Joint, 7 or 8 fair green
flowering Leaves, broader than those of Clereries or
Græeri Gnafa, in a manner smooth, or but little
rough at all. At the tops of the Stalks, stand 4 or
5 white forest Smelling Flowers, made of 5 Leaves
apiece, and open like a Star, after which, comes
small round Seed, a little rough, or closing to
whateverset it touches.

IV. The second, or Woodroof with a Blew
Flower. Its Root is small, somewhat yellowish and
fibrous, growing every Year. It has feathem more
than one round Stalk arising from its Root, set full
of Joints, at every one of which stand several
small and something long green Leaves encompassing
it, not so smooth and green as the former, which
spreads it self out into small Branches, from the
bottom almost up to the top, set with the like Leaves,
but smaller, where the Flowers stand 3 or 4 toge-
ther, each upon a small Footstalk, which are of the
same Magnitude with the former, or rather some-
thing less, and of a fair bleath Purple color,

Woodroof Blew Flower’d.

Woodroof Break-Stone.

V. The
Chap. 742. **English Herbs.**

**XV.** The third, or Smalt Stone-Break Woodroof. Its Root is white and thready. It is a very small plant, growing upright, with figure, rough, rufflike Branches, spreading it self out into many small Divisions, almost like unto an Herb-Tail, full of Leaves, with small Leaves, and sometimes more at a Joint, somewhat long and narrow, like unto Line or Flax, but rough. At the tops of the Branches come forth many small white Flowers, set in Spikes, and 4 or 5 standing upon a short stalk, together, which stand in rough Mystic, in which is contained the Seed, which is black and small.

**VI.** The Places. The preff is found growing Wild in the Woods in Germany, but both thift and Record are Planted and Nurrit up with us in Gardens. The third Cl-Version grown about Salamantica in Spain, but Parkinson says he found it on the right hand of Bradfurd Bridge, at the lower end of Grey-Fen Land next London, by the Water Courfe which paffes along there; and for that reason, may perhaps be found in many other parts of this Kingdom besides.

**VII.** The Tint. The two-flift Flower about May, and their Seed ripens in the mean Seafon, while they are in Flower, or prefently after. The third Flowers in the end of Summer, the Seed ripening in fome small time following.

**VIII.** The Qualities. Woodroof is temperate in respect of heat or cold, dryness or moisture, and is very like in Qualities to our Ladies-Eftryam. They are Aperitive, Affeotive and Valerianaceous, Cardiac and Hepatic, cheering the Heart, and making it merry. The Break-Bone Woodroof is temperate also, hot and dry in the fifth degree. Aperitive, Affeotive, opens Obsuftrations of the Bowels, is Diuretikes and Nephritikes.

**IX.** The Specifications. The Woodroofs clear the Heart, refift Melancholy, make a Man light-hearted and pleafant, and induce the Curing of Wounds. The Breakbone opens Obsuftrations of the Urinary Paffages, provokes Urine powerfully, and gives exit in the Stomach, and is an excellent thing for that Defeafe in the Throat called a Leath.

**X.** The Preparations. From Woodroof you may have. 1. A Liquid Juice. 2. An Infufion or Decotion in Wine. 3. A Cataplasm. 4. A Diluted Water. From the Break-Bone you have. 1. A Liquid Juice. 2. A Decotion in Water or Wine. 3. Where both of the Woodroofs, the fift is only or chiefly used.

The Virtues.

**XI.** The Liquid Juice of Woodroof. If it be clarified, it may be taken from 1 Spoonful to 2 or 3 at a time, against Hypochondriack Melancholy, and Palpitations of the Heart, for it very much cheers the Heart, and revives both Vital and Animal Spirits, making the Patient merry. It strengthens the Stomach, and relieves its depraved Tone; curifes Appetite, and is good against Naufeousness and Vomiting. It is both a Preervative and Curative of the Plague, and is good against all kinds of Malign and Pestilential Disaffores.

**XII.** The Infufion or Decotion of Woodroof is very good. They have all the former Virtues, but not altogether so powerful, but admirable open Obftrufions of Liver, Spleen and Melantery, preserving the Vital and Animal Spirits from Intelle- tually and the power of any Drugged Disaffores.

**XIII.** The Cataplasm of Woodroof. It is made of the green Herb bruited. Being applied, it is

---

**CHAP. DCCXII.**

Of **WOLVES-BANE.** Deadly.

I. THE Name. The Arabians call it Chancb Addip, or Addb. (1. e. Strangulare Lapid.) in Greek Rendems in Latin Aconitum, Luparia, as also, Lycothina, and Gyntollata, (because it kills both Wolves and Dogs) in English WolvesBone.

The Descriptions.

III. The Thirtis, or Winter Woodroof-bane. Its Root is Tuberous. Its leaf both for shape and color unto Aconitae Roots, that they may easily deceive One not well vers'd in them, but that this is browner and fainter without, and yellow within, if it is cut open, or broken. This little Plant springs up in divers Leaves oftentimes in the deep of Winter in January, if the weather is any thing mild, but most commonly after the deep and long Winters, bearing up many times.
times the Sawto upon the heads of the Leaves, which, like unto the Anemones, do every Leaf rise from the Root, upon several short foot Stalks, at above 6 Fingers high, some having Flowers in the middle of them, (which mostly commonly come up first) and some none: which Leaves stand as it were round, the Stalk rising up under the middle of the Leaf, deeply cut in, and goes almost to the middle Stalk, of a very fair deep green color: in the middle whereof, close unto the Leaf, stands a small yellow flower, consisting of 6 or 6 Leaves, very like a Crowfoot, with yellow Tendrils in the middle. After the Flower is fallen, there rise up divers small Horns or Cods set together, in which are contained whitish round yellow Seed.

V. The Second, or Pale Flower'd Winter Woolfs-bane. This in its Root, Stalks, Leaves, Flowers and Seed, manner and form of growing, is in all respects like the former, only, that the Flowers of this are of a pale yellow color, and in some Plants almost white.

V. The Third, or either whitish Woolfs-bane. Its Root consists of a number of dark brown Strings, which grow and spread themselves strangely in the Ground. It springs not out of the Earth till the Spring is well began, and then it sends forth great broad green Leaves, deeply cut in about the Edges, and not much unlike the Leaves of the great Woolfs-bane whitish early.

V. Woolfs-bane whitish early.

VII. The Fifth, or greater Woolfs-bane, with Larks heel Eleven. Its Root is something thicke, long, and blackish, with several fibres and long Strings answering to it, by which it takes birth in the Ground: From which shoots several green Leaves, of a very fat or dark green color. Standing upon pretty long foot Stalks, cut in on the Edges into 3 deep divisions or parts, even to the Stalk, and somewhat rough or hairy, each part whereof is also dotted about the Edges: From among which rises up a reasonable and strong round hairy Stalk, about 3 feet high, having some such Leaves thereon as grow below; at the Top whereof is growing many Flowers Spikes fashion, one above another, which are fashioned something like those of Larks heels, but larger and thicker, with a short thick crooked heel behind them, of a very dead or dead blushful purple color, seeming as if they were ragged or crumpled withal, which adds a greater unfavorableness to them on the outside, but of a little lesser or more lovely blue color, and smooth on the inside. After which come several small rough Cods, standing together, like as other Aconites and Columbines also do, in which is contained a rugged black Seed.

V. Woolfs-bane Larks heel'd, Greater and Lesser.

VIII. The Sixth, or lesser Woolfs-bane, with Larks heel. Its Root differs from the former, this having 3 or 4 thick blackish Roots, ending in small long points, issuing together at the head. It has
has divers smooth green Leaves, upon very long foot Stalks; but not altogether so large, or of so sad a green color, much more finely cut in and divided, in many jag or parts than the former. The Seeds of this Clerfe rise not up to high, and bear some smaller and finer Leaves thereon, which ends in a small spike or head, of almost as large flowers, with a short ftre or boil behind the other ftre, but of a fader bleffe purple color, and more finely, as well on the spike as in the flode. The Gods and Seed are ares like the former.

X. The Places. They all grow Wild in Germany, Italy, and other Countries, in Woods and shady places: but with us they are only Nurift up in Gardens.

X. The Times. The two first ftre bring forth their Flowers with their green Leaves, commonly in January, for which they are only esteemed. The others Flower later, as in May and June, and the Seed is ripe commonly in the following Months. The Roos of the two first may be Set in any of the Summer Months, and almoft in any place, for they are hardly Plants, and will thrive almost any where.

XII. The Qualities. They are all hot and dry in the extremity of the fourth degree, burning and delerious, or deadly, and therefore are not to be given inwardly. The Roots, Leaves being dip into the Juice thereof, to Empoyfons them, that they kill all Living things which are Wounded therewith.

XII. The Specification. Woolfs-bane is prefcriveable to kill Lice and Vermin in Children Heads, and to cleafe them from Scurf, &c. to confines dead Flefh in Ulcers and Sores, and to clear the Eye-fight from any Hay, Pin and Web, Cloud or Film, &c. which may obfcrvfe the Sight.

XIII. The Preparations. You may have therefrom.

1. A Powder of the Roots and whole Plant.
2. A Decoction of the Juice.
3. A Diluted Water from the whole Plant.

The Virtues.

XIV. The Powder. Either alone, or made into an Ointment with Hog Lard, and applifi to Children Heads troubled with Lice, Scurf, Murpiffe, Dandriff, running Sores, &c. it kills the Lice, and caufe the Head of the other Maladies.

XV. The Decoction of Roots, Leaves, Seed in Water. It is good for all the purpofes aforrefd. Both Decoction and Powder are ufed, as Gelen fays, in foot Sores and purif Ulcers, to confume the dead Flefh, and caufe them, but they are not to be applied to Sores in the Mouth or Pri- vities, which are too tender Parts for any fuch vi- olen Medicaments.

XVI. The Diluted Water. Being dipp'd into the Eyes, it is good to take away the Inflammation, as allo Specks, Spots, Iuffs, Clouds, Films, &c. which may grow in them, or trouble the Eye.

XVII. Note. If any one should by accident be Poison'd, by taking inwardly Woolfs-bane, he ought immediately to feek for Cure, the method of which, we have laid down in the Cure of Poison by Helmet-Borer or Monks-Head; which (to avoid Torture or vain Repetition) be pleafe to read in Chap. CCLIII. Sect. XVI. aforfepring of this Work, where it is plainly ex- prifed.

CHAP. DCCXLIII.

OF WOOLSF ANE Antidote: OR, DORONICUM.

I. THE Name. The Arabic call it (as is Supposed) Doronigi or Dorurgi; (whence the Name Doronicum is impofed to be derived, because it is not to be found in any of the Ancien Greek or Latine Writers) Our Modern Au- thors call it in Latin Doriocum; and we in English Woolfs-bane Antidote, Woolfs-bane, and Doronicum.

II. The Kinds. Authors have made eleven or twelve Species herein, many of which may not in some Ages be known by us; we fhall therefore take notice only of 4 or 5 ftre, which are either Nurift up in our Gardens, or grow Wild in Our Country, or the Roots of which are Sold in the Drugs-fhops.
1. Doronicum Vulgare, Doronicum Roman- num, by all Writers, our common Woolfs-bane Antidote or Doronicum: I call it ours, because it is common as well in our Country, as in the Gardens of other Countries.
2. Doronicum minus Clufji aurum-gaee, Doronicum Plantagojalis fa- lso Bawhiti. The latter Woolfs-bane Antidote, or Doronicum.

The Description.

III. The ftre, or our common Woolfs-bane An- tidote, or Doronicum; (so called ours, because it has been long been known unto us, end kept in our Gardens.) Its Roots are Tubuous, small, thick and fhort, creeping or lying under the upper craft of the Earth, with divers small Fibres fothing from them down into the Ground, and carrying divers fuch like tubuous Roots round about it, which are tenderer and not hard, somewhat whitife, with some joints therein, and greenish on the upper Side next to the upper face of the Ground. Some would make thefe Roots to refemble a Dead Scorpion, be- cause of the Joints, which are like Scales thereon: The former part next the Leaves, being thick, to be the body, and the other parts being fmall to be the Tail, which is fomething fweet in Taffe, and a little bitter, and a little aquef aquamifus without. From this Root fpringing up divers Leaves, each fanding by it fell upon a long foot Stalk, which are fomewhat round, greater than the Roman Sown- breed Leaves, soft and gentle in handnefs, fome- what hairy, and of a fucht green color. From a- mong which rife fomewhat green round Stalks, about a Tord high or more, parted at the Top, some- times into one or two Branches, every one carrying a large Flower, somewhat like the Corn Marigold, but much larger, having many narrow long yellow Leaves,
Salmon's Herbal.  
Lib. 4.

VWoolfs-bane Antidote: or, Doronicum.

VIII. The fifth, or Doronicum of the Shops. 
That which is Sold in the Shops, is the Doronicum quartum Clusii, vel Striucani, Doronicum incarnatum flore magno Bauhini: The broad Leaved Doronicum with a large flower. It is somewhat long, blackish on the outside and jointed, but so plainly to be disderned, the joints rising upwards, and not downwards, (as they do in most of the rest) spreading it self, by means of certain stelrings, very far about, with other tuberous Roots of like form, many in number, each Tuber having many long white Fibres underneath it. It is a low Plant, but has many large, and somewhat long round Leaves, denting about the Edges, like unto the third foot before Described, standing upon high foot Stalks. The Stalk has four Leaves thereon, longer and narrower than those below, and at its Top (not having any Branches) one Flower, larger than any of the former, but like like unto them, having many long yellow Leaves, set about a middle brownish yellow Throat. The Root of this is all that we have in the Shops, which is Sold for the True Arabian Doronicum, but truly is not it: 
however, our Modern Physicians generally agree, that it is Ansewes the End, and has the Virtues of the True Arabian Kind, and it has no agreement therewith in form.

VIII. The sixth, or True Arabian Doronicum. 
Avicen Lib. II. Cap. CC. and Sarapio in his Book of Simples, Cap. CCCXXV. base Described it saile, A Root of the highest of ones Triumph, of a hard and heavy Substance, of a yellow color on the outside, and brown within, with some white Veins, and that it is hot and dry in the third Degree. Parkinson fentes it to be of Opinion, that it is a kind of American Machinum, (often found among the Machinns, or Black Ginger) brought chieftly from Brazil, though Lobel calls Machinii rara varietas, which has divers circular knotted Lines, as it were like Joints on the outside, is firm and heavy, and full of white Veins when it is broken, is also very sharp, quick, and biting, and Aromatic in Taste. This fays he, having all the Notes of the Arabian Kind, can be no other than the Legitimate and True Doronicum, however he fays, he leaves it for every one to judge as his reason shall direct him.

IX. The Places. 
The first grows on the Mountains in Scyptis, beyond the Lake Leman, and in other places in France and Germany; but with us only in Gardens. The second grows in France. The third on the Woody Mountains in Austria, and about Trent, as Chfous says: but both of them with us, only in Gardens. The fourth in many places in Germany, in Medows and elsewhere; and with us on the Hilly Grounds in Norrtumberland. The fifth, Chfous says, grows near Newberg in Stiria, the Root of which is brought to us dried, and Sold at the Druggists-Shops. The sixth, is an absolute Stranger with us, and unless the American Machinum be it, which by Accident as it were, is now and then brought hither, we know nothing at all of it.
The Virtues.

XV. The Liquid Juice of the Roots and Leavens. It is to be found good to be put into eyes which are hot, red, and inflamed, to take away their prickings, and ease their pain.

XVI. The Decoction of the Root in Wine or Water. It is an excellent Cordial, relieves and Cures the Poison of Animal, Mousk-hood, and other poisonous Plants; as also the poisonous Bitings of Vipers, Mad Dogs, and other venomous Creatures; it cleanses the Brest and Lungs of thick tough Humors, flops the Cough, and gives ease in Pleur-rick Pains and Stitches in the Sides, Head-aches, Vomiting, &c. Dole half a Pint at a time Morning and Evening, a little Dulcified with Sugar.

XVII. The Powder of the Root. It has all the Virtues of the Decoction, and may be given Morning and Night, from a Scruple to 2 Drams, made up into an Elixirry with some proper Syrup, or Conserve; or mixed in Syrup of Citron Seeds, or of Juice of Citrons, and to be given in a Glass of Canary, Sherry, or Maders Wine, &c.

XVIII. The Decoction of the English or German Woods-bane Antidote in Wine. It purges the Terms in Women, eases the Pains and Diatures of the Womb, is effectual against Poison, especially the Poison of the Fish called Lupus Humatinus, as also the venomous Biting of Show Mice and Toads. It reliefs the mighty Potency of Opium, in such as have taken too much of it: and is given with good success to those who have a Bloody-Flux, or any other Pains, or Griplings in the Stomach or other Bowels, by reason of Sharp Humors offending them. It is probable against Convulsions, Cums, Weaknes, and other pains and dispositions of the Nerves, Tendons, and Joints: and if it is given with the fine Powder of Curset Seed, or rather of Ducemus Seed, it potently expels gravel, small Stones, and Tartarous Slime, from the Urines, Ureters and Bladder. It is applied also outwardly to ease Inflammations, and take away the pains of old running Sores, purrid and eaning Ulcers, and the like.

XIX. The Powder of the Root of the Same Plant. It may be given Morning and Night, from a Dram to two Drams, mixt with some proper Syrup, and then to be swallowed down with some of the forementioned Decoction, or with a Glass of Canary, Sherry, or some other like generous Wine, for all the purposes and intentions the aforesaid Decoction is appropriated to. It is used also as an Elixir, or rather a Sublimation, by which way it cleanses the Head and Brain of cold and moist Inflammations, which cause Dullness, Drownines, and other ill habits of those Parts.

CHAP. DCCXLV.

Of WORMWOOD Common.

1. THE Names. It is called by the Arabic Albesn, by the Greek Aptaia and in Latin Absinthium; and in English Wormwood. Discovered calls it Balsamen, a profundo amare, from its exceeding Bitternes.

H. The Kinds. Authors make a great many Kinds of this Plant; we shall take notice of four several sorts, viz. 1. Absinthium vulgare, Absinthium vulgare,

Chap. 743. English Herbs.
V. The Wormwood. It flowers and seeds in July and August, which when it is in the height of its flowering, ought to be gathered, dried, and carefully laid up for Medical uses.

VIII. The Specification. It Cures the Scourvy in a cold Condition, rectifies the Tone of the Stomach and Bowels, is good against nausea, fits Vomiting, strengthens the Ventricle, provokes Urine and the Terms, Cures Scurvy, and helps against the hard Swellings of the Belly; causes a good Appetite, and a strong Digestion, and is profitable against the Yellow Jaundice. It is also an Antidote against many Vegetable Poisons, dissolves Quinces or Tumors in the Throat, and is a good Collyrium, taking away Whistles, Pimpls, Worms, Roughnecks, and other deformities of the Skin: It helps the dimness of the Eyes, tame and running Ears, and eases their Pains; It is good against the swelling and hardness of the Spleen; it purges Cholick Humors downwards, both by Stool and Urine. It also kills Worms in Children being inwardly taken, and outwardly applied, it is good against the Colick, Bloody Flux, and all other Fluxes of the Belly: And being constantly used, it is laid to Cure a Bunking Breath. It is commended against Tertian and other lingering Agues, by opening Old Fibrills, purging by Urine, strengthening the Stomach and Liver, and altering the whole habit of the Body.

The Virtues.

X. The Liquid Juice. If it be given to 2, 3, 4, or 5 Spoonfuls, according to Age and Strength, it is Cathartic, and Purges the Body of Cholerick and Putridous Humors, strengthening the Bowels at the same time, and Suit's up the Nodder, as an Earline, it purges the Head and Brain of Putridous Remnants. If it is Inflated and made up into Pills, to Grains being taken at a time, admirably strengthens the Stomach.

XI. The Essence. If taken in due Dose in Broth or Wine, it gently Purges the Vexxas of Cholerick and Flagmatick Humors, kills Worms in the Stomach and Belly, provokes Urine and the Terms, opens Obstructedness of Stomach, Liver, Spleen, Melantrony, Reins and Womb; is good against the Jaundice, Dropie, Gout, and Scyvy, cures a good Appetite and Digestion, strengthens the Stomach and Bowels, Cures Fluxes of the Belly, and is good against Tertian Agues, and other like Chronicke Difficult: it stops Vomiting, is good against a Bunking Breath and Loasting, and rectifies the Tone of the Stomach. Dose from a quarter to half a Spoonful in Canary, or other ganecous Wine, Morning, Noon, and Night; but if it is to Purge withal, it may be taken from a Spoonful to 2 or 3, or more, in any proper Vehicle.

XII. The
XII. The Decoction in Water or Wine. It has all the former Virtues, and may be given Morning and Night, at a time, in any proper Vehicle. It is said to be peculiarly good against the Yellow Jaundice.

XIII. Wormwood Beer. It is Stomachick, comforts and warms all the Stomach, takes away loathing of Mest, and causes a good Appetite and Digestion, it alters a Cold habit of Body by long taking it, and purifies the Blood.

XIV. An Infusion in Water, or Wormwood Wine. Take Choice Rhine Wine a Collin, dried Wormwood Leaves and Tops of Flowers, a good handful; mix them, and steep them up close for a Month or more, shaking the Vessel once or twice a Day, and all the while it is used, let it remain upon the Herb or Exce. It is taken at any time mixed with choice Canary, it warms a Cold Stomach, causes a good Appetite and Digestion, expels Wind, kills Worms, and being Drunk alone without mixture, Cures the Green-Sicknes, being taken in the Morning Fasting, and frequently used, it prevents the Palsy.

XV. The Powder of the Herb and Heads of Flowers. It heats, cleanses, drys, and strengthens the Vifperes: It has all the Virtues of the Ellence, and is used when it is to be taken from 10 Grains to a Dram, (according to Age and other Accidents) mix with Honey, or Pulp of an Apple, or some such like, and wash down with a Glass of White Wine, or the like, it is good against Surfeiting and Drunkenness, and the Putridity of the Stomach, and helps against a Hinking Breath.

XVI. The Effential Silt. It has all the Virtues of the Liquid Juice, Ellence, Decoction, Wine and Powder, and that in an excitable manner. It may be given against all those Difficulties, as also the Green-Sicknes in Virgins: from a Scruple to a Dram, every Morning Fasting, and at Bed time, in a Glass of White Port or Lisbon Wines, or in Canary, with a Continuance, till the Patient grows well.

XVII. Cowries mixture. Take the Tops or flowers of Wormwood, Flowers of Rosemary, and Flowers of Black Thorn, or Sloe-Bud, of each 3 Ounces, Saffron 1 Ounce, Rhine Wine 4 or 5 Quarts, and clove covered, simmer them over the fire an hour or more, then Strain out and keep it for use. It is commendable for the Cure of the Yellow Jaundice, a small portion of it being taken in the Morning Fasting, (the Body being prepared beforehand by Purging) and so taken, it brings down also the Terms in Women; and if a little Wine Vinegar be added to it, it is said to help those who are PoiUioned or almost Strangled, by eating PoisOons Mushrooms; and being taken mixed with Wine, it is good against the Poison of the black Chamfer Root, Hernioc, Shrew-Mouse, and Dragon Mimics, which is called a Quaiiver.

XVIII. The Simple Syrup. Take Clarified Juice of Wormwood, Clarified Sugar, or the double Refined, of each 4 Pounds; mix, and to the best of a Bath make a Syrup. It has all the Virtues of the Juice, Ellence, and Decoction, and may be given from one Spoonful to a Glasse of Wine: If Nitre be diluted in it, it is then good against the Quinsey, and Inflammations of the Throat and Almonds, to Gurgle with it. Drop into the Eyes, it is good against the Tinges of Sight, Clouds, Spots Filies, and into the Ears, it eases their Pain, and heals running Sore there.

XIX. The Compound Syrup. Take dried Wormwood, a pound; Red Hoes, 4 Ounces; Indian Spincber, an Ounce; Old White Port or Lisbon Wine, Juice of Quinces, of each 5 Parts; keep them a whole Day in a close Earthen Vessel, then Boil very gently, and Strain them already, and with 4 Pounds of double refined Sugar, make it into a Syrup in the hot of a Bath. It is good for a cold and flagmatick Stomach, eases its Pain, and strengtheneth it, as also the Liver and Concoptive Faculty, cures a good Appetite, expels Wind, provokes Urine, and prevails against the Yellow Jaundice. Dole one from two to a Spoonful, in the Morning and Night, in a Glass of generous Wines.

XX. Oleum Absinthii: Infused Oil of Wormwood, Take Flowers or Tops of Wormwood 4 Ounces, 1 pound Oil Olive, 3 Pounds mix, and set them in a hot Sun in a Glass close stopp'd a whole Week, shaking them every Day, then boil in a Bath, press out the Oil, and put in fresh Wormwood as before, which boil and press out: then a second and third time, adding a 4th Ounces more of fresh Wormwood, put it in also 4 Ounces of Juice of Wormwood, which boil again in a Bath, till the humblity of the Juice is evaporated, then press off and keep it for a month. It heats and strengthens the Stomach, being Anointed thereon, Anointed on the Stomach and Belly, it kills Worms, the Powder being given alfo at the same time: Anointed on the Back and Evenings; it is good against Surfeiting and Drunkenness, and the Putridity of the Stomach, and helps against a Hinking Breath.

XXI. The Corpseplasm. It is made of the green Herb, by heating it in a wooden Mortar with a wooden Pellel, adding a little Or Gutt to it, in Appling it to the Stomach, it kills Worms in those parts, and strengthens them, giving cafe alfo to pains of the Liver and Spleen.

XXII. Troches of Wormwood Compound. Take Wormwood leaves and Flowers in fine Powder, Red Saffron in Powder, Anise-Seeds in Powder, of each 2 Ounces: Roots of Asarabacc, Rhinbar, Speaklad, Smelling-Seed, Anise, Buyek, of each 3 Ounces; 12 Grains of Almonds bitter, Infusiate Juice of Mascull, of each 1 Ounce also: Juice of Saffrey, enough to make all into a Mufa for Troches. It is a very bitter Medicament, and scarcely ever taken alone, but with some proper Vehicle. They strengthen the Stomach, Liver, Spleen, Mefentery, and other Bowels, kill Worms in the Body, opens Obstructions of the Pifera, and are profitable against the Yellow Jaundice. Dole a Dram Morning and Night, in Syrup of Citron Pools.

XXIII. The Simple Distilled Water. It heals and comforts the Stomach, is good against Loathing, Vomiting, expels Wind, helps Digestion, and causes a good Appetite; and is said to give, erfe in the Tooth-ach. It has all the Virtues of the Juice and Ellence, but much weaker: Drop into the Eyes, it clears the Eye-lights, and bathe upon the Temples, it eases the Head-ach.

XXIV. The Simple Spirit. It is made from the evaporated Juice, by Distilling it in a Copper Atembick Thand within, with its Worm or Refrigeratory. Or, Take Leaves and Tops of dried Wormwood 4 Pounds, of small Quinces, 6 Quinces, 24 hours, then Distil in a Crochet as before, adding to every Pint of the Distilled Water, two Ounces of double refined Sugar: The first quart you may call Simple Spirit Wormwood, what follows after, Juice for Wormwood Water. These...
have the Virtues of Wormwood, but more fit for Ancient People, whose Natural heat is abated; it warms and comforts the Stomach, and helps Digestion; and is good for such as are troubled with Cachexy, Dropsy, and Jaundice, &c.

XXV. Water and Spirit of Wormwood Compound. Take Tops and Leaves of dried Wormwood, 2 Pounds, Annelfeds, half a Pound, & 6 Gallons of small Wines; mix, and diggel all together for 24 hours, then distil them in an Alembrick at a foreside, adding 2 Ounces of double refined Sugar to every Pint of the distilled Liquor. The first Quart keep for Spirit of Wormwood Compound: and all the rest for Wormwood Water Compound. It has all the former Virtues, but more agreeable to fuch as have got Coughs, Cold, Wheezing, or any Ruffling in the Stomach and Lungs, troubled with the Colic.

XXVI. Oil of Wormwood Diluted. It has all the Specifick Virtues afocribed to Wormwood, at Self. VIII. foregoing: A Drop, or 2 or 3, of this Oil, mixt with a little white Sugar, and then drank in a Glafs of White Port or Lisbon Wine, or Canary, makes an excellent draught to strength- en the Stomach, Liver, and other Fiseries; to help against a Cachexia, cause a good Appetit and Digestion, and make a good color in the Face: It expels Wind, provokes Urine, and is good a gainst Hypochondriack Melancholy, and universally strengthens the whole Body.

XXVII. Petasites Abfnthiifolium Powers of Wormwood. They have all the Virtues of the Oil exce- cted, and fo much ftilted, and are alto much more pleafing to be taken, you may take Morning, Noon and Night; 40 or 50 Drops in a Glafs of generous Wine.

XXVIII. The Spiritus Tinctura. 'Tis a Noble Medicament, and has all the Specifick Virtues enumerated, at Self. VIII. foregoing: it refills Vomiting and Naufeousnefs, and strengthens the Stomach above all other Preparations of Wormwood. You may take 20, 30, or 40 Drops, or more at a time, in a Glafs of Curacy, the more the Wine is, the greater number of Drops may be given at a time.

XXIX. The Acid Tincture. It is an Antidote against all hot, burning, and maligne Fevers, and is an excellent thing against the Plague or Pellencula it self, and all other Contagious and Pellential Diffiaces: it provokes Urine and the Torms, and carries off the Morbid caufe of Internal diffiaces, by the Urinary passages.

XXX. The Oily Tincture. It is good to pro-voke Urine, and cleansen the Urinary passages from Sand, Gravel, Stones, and Slime and Tarra- rous matter infilling thefe Parts: it is an ex- cellent thing against the Colic, Palfy, Convulsions of the Bowels, and Goat afeeting the Stomach. Dof from 8 to 16 or 20 Drops, inf Dof into and mixt with Sugar, and then to be taken in a Glafs of White Port or Lisbon Wine: outwisd, it is good to Anoint parts afflicted with the Goat, Scallies, Rheumatism, &c. As also to help the Headach, and exceeding from a cold and moif caufe, being Anointed upon the Part. And applied to the Piles or Hemorrhoids, it gives preñent cafe, and in a fhort time after Cures them.

XXXI. The Fixed or Elementary Salts, made by Incineration and Exhirtation. Taken from 10 Grains to a Scrolpe, or half a Dram, it is an An- tidote againft the Scurvy, and purifies the whole Masf of Blood and Lymph, effectually carrying off the Ruminations of thofe Fluids by Urine. It may be given in Wine, in a cold and moif hab- bit of Body: but in a hot and dry Conftitution, it ought to be given in a thin fort of Water Gruel. If a Scrolpe or half a Dram of it be mixed with a large Spoonful of Juice of Limons, and so given to one that is afflicted with an extream Vomiting, it stops it upon the fport: It gives cafe in the Strangury, provokes Urine potently, and expef Sand, Gravel, and Tarrarous Muclage, from the Renes, Ureters, and bladder.

**CHAP. DCXLV.**

**OF WORMWOOD ROMAN: OR, PONTICK.**

**T**HE Name. It is called in Greek *Ablthium* commune: in Latin *Abfinthium Romanum Abfinthium Ponticum*, by almoft all Writers. In English, Roman Wormwood, and Pontick Wormwood.

II. The Kinds. We obferve but three Species, viz. 1. *Abfinthium Romanum vulgare*, *Abfinthium Ponticum commune*: Our common Roman, or Pontick Wormwood. This by many is termed to be the true *Abfinthium of Pontus*, which Di- oforides and Galen do fo much commend. 2. *Abfinthium Ponticum verum*, *Abfinthium Poni- cium Montanum Bautili*, *Abfinthium Montanum Camerarii O Tiberinomontii*: who alto calls it Romanum Abfinthium commune, sive Alpium Gif- nerii, *Abfinthium tensifolium Ponticum Galenic Ge- rardo*: The true Roman Wormwood. 3. *Abfinthium tensifolium Afrorinicum Chief*, &c. *Abfinthium communis*... (beauf it has been found to grow in several Parts in Italy.) *Abfinthium Ponticum Tridentinum Herbariwm Bello & Laut ensure*: Fine Lev'd Pontick Wormwood, or Auslian Wormwood.

**The Descriptions.**

III. The fift, or our common Roman or Pon- tick Wormwood. The Roots from a short Head, hoot forth many long Fibres into the Earth, by which it is nourished, and fends forth divers Sprouts round about it, by which it much increafes. It is a fmall fweet Herb, with much more fenter and fluer Stalks than the next; on which grow very fmall and fhort fhrly white Leaves, fmalier and finer than thofe of the fine Southerwood; which grows at feparal Parts, many coming forth together: at the tops of the Stalks grow fmall fyl- lefines Flowers, neither fo many nor fo great, as thoae of the next. The ftalks herof is faint, and far weaker than in the next to be Described; and the Tafle thereof much les bitter. 4. The second, or true Roman Wormwood, its Roots are fmalier, les Woody, and fuller of Fibres; than thoae of our Common Wormwood in the left Chapters: It has also more fnder and fluer Stalks, by a Boot at leeff, than that of our Common Wormwood, and reafonable large Leaves, yet fmalier, and more finely cut in and divided than that, but as white and leffy both Leaves and Stalks. The Flowers are also of a pale yellow color, ftanding upon the fmalb branches in the fame manner: so that excepring it is fmalier every way, and in each part, it is altogether like to our Common broad
Root, spreading it self under Ground, which send up many small, hard, stiff, and hoary Stalks, on which are set, without order, small and somewhat long, and hoary Leaves, very like to the Leaves of Marth Wormwood, which Stalks are divided towards their tops, into many other small and slender Branches, rising from the Toints where the Leaves do grow, with many small Heads, which give forth many small white dit Flowers.

VI. The Places. They are Italian, Austrian, and Hungarian Plants, but for their excellent Virtues sake, have been Transplanted into our Country, where now they are Nurt up in Gardens.

VII. The Times. They all Flower in July and August, in which Times they ought to be Gathered, and carefully laid up for Medical Uses.

VIII. As to their Qualities, Specification, Preparations and Virtues, they are the same with those of our Common Wormwood, in the former Chapter, and therefore no more need be said of them here. But this is to be Observed, that our Common sort in the former Chapter, is the most Potent and Efficacious to all the Purposes to which any of those may be applied.

CHAP. DCCXLI.

OF WORMWOOD,

Sea or Marsh.

I. THE Names. It is called in Greek 

Archon, 

Androm, &c. in Latin

Abreathium Serphium, and Serphium, Abrathium Maritimum, &c; in English, English, &c. Wormwood, and Sea Wormwood.

II. The Kinds. Authors give us 4 or 5 sorts of this Plant, but not being Common with us, we shall only Treat of such as Grow in our Salt Marshes, or are Nurt up in our Gardens, viz.

1. Serphium Anglica, Abrathium Serphium, 

Abreathium Maritimum; &c. Our 

common English Match Wormwood.

2. Serphium album, Abrathium Maritimum album; White Match Wormwood.

3. Serphium Sepulchrum, Abrathium Sepulchrum; Yellow Match Wormwood.

4. Serphium Serphium, Abrathium Serphium; Common Wormwood.

The Descriptions.

III. The first, or our English Match Wormwood. Its Root runs something deep, yet spreads it self in the Ground, being composed of many large Strings and small Ryes. It rises up with many hoary round Stalks two Feet or more high, being well furnished and replent with a vast number of white hoary long and narrow Leaves, rather broader and longer than any Southernwood Leaves, having small bitterish Tails, and a very pleasing Strong Smell. The Flowers are small and yellow, standing at the tops of the Leaves and Branches, which afterwards give very small Seed.

IV. The second, or white Match Wormwood. Its Root is tough, woody and strong, creeping for abroad, by which means it very much increases. It has tough hoary white Stalks 2 or 3 Feet high, which a little spread out into Branches. The Leaves are ranged, several small narrow ones (not very long) set upon one middle Rib, which seem to be twined as it were into many Joggs, not altogether so large as the True Roman Wormwood, of a bitter Taste and pleasant Smell, of a very white

& 2.
Wormwood Marth.

V. The Places. The first grows in the Salt Marshes in many places of England. It found it growing in the Salt Marsh by the Rivers side, running along the South side of the Town of Lynn Regis in Norfolk, on the South of that field called the Priors, and in several other Salt Marshes near that Town. And is plentifully found in the Salt Marshes in Holland, Flanders, and other of the Low Countries. The other is found on the Sea Coasts of Germany and Italy; and in some of the Salt Marshes of England: Those Salt Soils overflowed by the Sea, are their Native places of growth; but being Transplanted into our Gardens, they thrive as well as if they were Natural to them.

VI. The Times. They Flower and Seed in the same Times, in which all the other Wormwoods do.

VII. The Qualities. They are hot and dry in the second degree, Aperitive, Abstensive, Stomachick and Alexipharmick.

VIII. The Specification. They have all the Virtues of the Common and Roman Wormwoods, but not half their Strength and force in their Effects. But by reason they are not altogether so bitter, they are more acceptable to the Nicer sort of Patients. They refit and expel Poxon, and gently Purge the Belly.

IX. The Preparations. All the Preparations which are made of Common Wormwood, may be made of the Marth Kinds; yet these three are the most usual, viz. 1. A Liquid Juice. 2. A Decoction in Wine. 3. A Cataplasm.

The Virtues.

X. The Liquid Junes. Taken to 2 or 3 Ounces in Yeal Booth in the Morning, it gently loosens the Belly, and kills small Worms in the Stomach and Guts.

XI. The Decoction in Wine. Taken from a quarter of a Pint to half a Pint, it refits and expels Poxon, chiefly that of Hemlock: but the Juice given in Wine for that purpoze, much exceeds the Decoction: But the Decoction is good against all Pains of the Stomach and Liver, for which purposes the Marth, exceeds even the Common Wormwood.

XII. The Cataplasm. The green Leaves made into a Prolishe by beating them with Figs, Nitre finely powdered, and Dandelk Flowers, and applied to the Belly, Sides, and Flanks, are said to be good for such as are Splenetick, or are troubled with the Dropy.

Wormwood Sea or Marth, white.

CHAP. DCCXLVII.

Of W O R M S E E D.

I. The Names. I find not by what Greek Name it has been called, but in Latin it is called Sementina, Semen ad Lumbriuos, Semen Lumbrioverum, and in English Wormseed.

II. The Kinds. We make two sorts hereof, viz. 1. Semen Tranfermatum, Foreign Wormseed, and this is called Santonicum, Semen Santonii, Semen Santonicum, Abythbi Santoni Semen, Sementina; Abythbi Santonicum Alexandrinum, Abythbi peregrinum Semen, Shop Wormseed, and Wormseed Wormwood. 2. Sementina Anglica, Semen ad Lumbriuos Anglicum, Camelina, Myzgnum alterum amaranum, English Wormseed. To these

there I think good to add, *Myrgrom Sylvestris, Pseudonymus, Linnus quinta Tragi, Sophia Tragi, Wild Gold of Pleasure, or Oily Seed. The Seed of this 'tis true, when perfectly ripe and dry, has no bitterness in it, but is Sweet and very pleasant, and a most acceptable Food to small Birds, as Finches, Linnets, and the like; but both Herb and Seed while they are green, have an unaccountable Bitterness beyond Expression, and therefore whilst it is Green, it is used as Wormseed, and will indeed do the same thing.

The Descriptions.

III. The first, or Sip of Wormseed. It has a plentiful Stringy and Fibrous Root, spreading it self far and deep in the Ground, from whence rises up a little short Stock, which afterwards spreads it self out into many Stalks, and smaller

Wormseed Tranfmarine:
Or, Santonicum.

Ramifications, insomuch that it is very full of Branches, but with very few Leaves, and those very small, and finely cut at the bottom, of an Ash color, out flared so plentifully with Seed upwards, that it seems to be there without Leaves, and wholly to consist of Seed, which as Rauwolfius says, are somewhat bitter in their Natural Places, and of a reasonable lively and quick Smell with us, especially if they be fresh and not old, but are indeed much stronger where they grow, and are but newly gathered.

IV. The second, or English Wormseed, (which Gerard calls Truce Wormseed.) Its Root is small and Woody, perishing every Year after Seed time, and then rising again of its own Seed. It grows with pretty tall upright Stalks, branching themselves out towards the top, and thicker yet with long narrow green Leaves than the next, somewhat like to those of the Single Wall-flower, but smaller, and of a whiter green color, and at the tops of the Stalks and Branches, come forth many very small

pale yellow Flowers, consisting of 4 Leaves spicet very like to those of Leucoium Sylvestris, or Wild Single Wall-flower, but much smaller, even by more than half, which being past away, after them come small long Cods, containing within them a very pale colored Seed, of a very bitter Taffy.

The other Wormseed English.

V. The
Salmon's Herbal.  Lib. 1.

V. The third, or Wild Gold of Pleasure, the other English Wormfeed. It has a long tender Root, with four Strange and Fibers adjoining to it, and comes up with but one round Stalk about a Yard high, which spreads it self out into Branches or Arms, which have long and somewhat narrow Leaves, yet fall twice as broad as the former, sharp pointed, something resembling those of Wood, but that these are longer, and broad at bottom, where they compose the Stalk about, with two points stick- ing out on either side, at whose tops come forth several whitish Flowers, very like to those of Flax, after which come forth small round Heads, with a small point at the top, very like in fashion to the Myrrh, with but one Seed, but these are full of small yellowish Seed, like to that of Gledits, which which it is green and fresh, is exceeding bitter, the not so after it is full ripe and dry.

VI. The Pipers. The first grows in Arabia, Syria and Palestina, from which place the Seed is brought to us. The second grows Wild in many places of England, which being brought into a Garden, and there left to Sow its Seed, it will come up again yearly itself. The third grows in Germany, and is much found in all their Flower Fields and Grounds, which being in Stalk like it, is accounted a Weed, and cast away, but some few the Seed to give to small Birds, on which they will feed when it is perfectly ripe, and pick it from the Stalk.

VII. The Thyme. The first Flowers late in the Year, but I think the certain time is not set down by any Author: The other two Flower in June and July, and their Seed is ripe in August and September.

VIII. The Quality. They are all hot and dry as Authors say, in the third degree.

IX. The Specification. They are only, or chiefly used to kill Worms in the Belly, for which they have been much very efficient.

X. The Preparation. The Seed of these Plants are only used, being taken either whole, or a little bruised.

The Virtue.

XI. The Seed of the Santonicum. It is given a Scruple at a time Evening and Morning to Children, either in a few Raifions stoned, or in the Pulp of a Ripe Apple or Pear, or in a Sweet Prune, or in Honey. It kills Worms in the Stomach and Belly; but if a little Aloe or Rhubarb be mixed with it, the Worms will then not only be killed, but they will likewise be expelled withal. And if the Seed be mixed with Aloe, and brought to the form of an Emplaster with Opl and, applied to the Stomach and Navel, it is said to do the same thing.

XII. The English Wormseed. If it be bruised, and given from a Scruple to a Dram, Night and Morning as the former, in any proper Vehicle, and then washed down with a Draught of Water, or Brine or Fop-play Dift, it is said effectually to kill Worms in the Stomach and Entrails, of what kind soever, it being often enough repeated.

XIII. The other English Wormseed, or Seed of the Wild Gold of Pleasure. This is to be taken bruised whilst it is green, and whilst its inherent Bitterness is yet with it. It may be given from a Scruple to a Dram, as the former are given, and is much more effectual than them both, being continued Morning and Night for some time. This by reason of its exceeding Bitterness, I am afraid few Children can be obliged to take it.
spread upon the Ground, or growing near to it, very rough and hairy, but of an over-nourished green color, deeply cut in, into 3 or more parts, not much unlike a Fig-Leaf, or leaf of the Corn-Parthep, each standing on a long Foot-Stalk, which as well as the Leaf is somewhat rough or ragged. From among which, rises up a very strong Stalk, covered over with a rough hairiness, 4 or 5 feet high, (Grand from 4 to 5 Cubits high, which may be in a Rich Soil, and its Native Climate,) having upon it such like Leaves as grow below, but stouter and stouter. It is divided (in some Plants) into several Branches, and sometimes it has only but one Head, the tops or top of which Branches or Stalks, base upon them one large Tuft or Umbel of yellow Flowers, set together in a Bundle, like those of Dill, which turn into Seed, large, flat, and of a Straw color, sharp and hot in Tuffe, and of a pleasing Flavour. From this Plant being Wounded, it is probable that that valuable Gum called Opogonax, does proceed, which is brought to us out of Syria, and the Plants adjacent, to their Mart Towns, as Alexandria, Cairo, Damasco, and some others. But others say, that the Gum Opogonax, is produced from the Panax Henoleuceum alterum, described in Chap. X. of this Book foregoing. I will not dispute the contrary, 'tis probable that they may both produce a like Gum, difficult to be known from one another, because their Juices seem to be of one and the same color, and both called by the same Name.

IV. The second, or All-heal, or Woundwort of Chiron, called also Doria's Woundwort. The Root is not so great as the Plant would seem to have, but with its larger Branches has many Fibres proceeding from its Head, which together take strong hold of the Earth, not dying in the Winter, but coming up fresh again every Spring. It has many great, thick, oily, long, deep green Leaves, almost as long as Dock Leaves, but thicker, sharper at the points, smaller at the lower ends, and broader in the middle, somewhat hairy or hard in bandling. From among which, rises up but one great arrowed Stalk, for the most part, about a Meter height, on which grows very plentifully, two or three such Leaves as grow below, but smaller. At the tops of which, and of its Branches, come forth a great many yellow Flowers, on green feathery Heads, like those of Knapweed, greener than those of Golden Rod, or of Sanvions Confund, which when they are ripe, are blown away with the Wind.

V. The third, or Great American Woundwot. Its Root is composed of many blackish Fibres, long and spreading in the Ground. This Plant is so like the former in appearance, that it cannot but be as-

Woundwort American.

Woundwort, or All-heal of Chiron Common.
Salmon's Herbal. Lib. I.

This Golden Herb, has several long, narrow, and sharp pointed Leaves, coming forth from the top of the Stalks, like to Chirons, or Dore's Woundwort, but not so great, yet thick like them, and of a darker green color. The stalks rise not to much above a foot high, having here and there numerous Leaves on them than below. The Flowers which stand at the tops, are larger than those of the former, having many narrow, long, yellow Leaves, and taken open, like a Star-Flower, with Thorns in their middles.

VII. The Placer. The first is a Native of Syria, and was brought from thence to Italy: It grows in the Kingdom of Naples as Matthiæus says, on the Alpine Hills, and on the Sea Coast of Sicca, but with us is Norith up in Gardens. The second grows as Lobel says, near the Banks of Rivers in Provence, and Narbone in France. The third in some parts of Florida in America. The fourth in thick woods near Orleanus in France, but with us, thefe two last are Garden Plants.

VIII. The Tinee. The first Flowers in September, and sometimes towards the end of that Month. The second and fourth Flower in June and July, and the third in August, none of them much earli-er or later.

Hercules's Woundwort, or All-beat.

IX. This Plant, as to its Qualities, Specification, Preparations and Virtues, as also the Opponam proceeding therefrom, have the fame with those of the other Herbs of All-beats, in the large at Chap. X. of this History of PLANTS aforegoing, fo that the Properties being every way the fame, we shall fay no more of them here, but refer you thither.

Of Chironis, and Golden Woundwort, or All-beats.

X. The Qualities. It is hot and dry in the third degree, Medicative, Altragentes, Voluntary and Alphamnestic.

XI. The Specification. Its chief ufe is for the curing of Green Wounds, and to expel the Poison, and even for the other Herbs of All-beats, suffers but by Vipers, Mad Dogs, and the Spider Phalangium, and other Venemous Creatures.

XII. The Preparations. You may have therefrom, 1. A Liquid Juice. 2. A Decotion in Wine or Water. 3. An Infalated or Decoiled Oil. 4. A Balsam. 5. A Powder. Parkifon fays, that this is in a Medium between the Confounds, as Saracen Confound, and the Golden Rod, and therefore that this need not further Repetition or Amplification of its Virtues. However, we think fit for the Publick Good, to add the following Sections.

The Virtues.

XIII. The Liquid Juice. Given inwardly, from to 4 Spoonfuls to 2, or more, in a Glass of Red Syrup wine, it is good against inward Bleedings, Bruises, or Ulcers in the Bowels, Reins or Bladder; and continued for some time in Mornings and Night, it contributes to the healing of all re- cent Wounds, running Sores and Ulcers; as also the Bittings of Vipers, Mad Dogs, Phalangium, or of any other Venemous Creature, in what part of the Body they are.
The Descriptions.

III. The first, or Giant Wrack, or Sea Weed. Its Roots are roundish and hairy, and bluish on the outside; from whence rise up small round and white hairy Heads, breaking out at the sides as it were into Branches, on the tops whereof, stand 3 or 4 very long and narrow soft green Leaves, some

being 4 or 5 Feet or more long, and about an Inch more or less broad. It has neither Stalk nor Seed, but lies on the Ground until the Tide rises it on the top of the Water, which being broken off by the force of the Waves, is carried to the Shore, where it is Gather'd, and kept for many things.

IV. The second, or broad thick Sea Wrack, or Girdle. This differs from the former, in that the Root is wholly Fibrous; the Stalk rising from thence thick and round, 2 or 3 Inches thick, and the Leaf, which is sometimes but one, (very seldom two) of a very great length; sometimes 6, 8, or 10 Feet, or divers Elfs long, and about 4 Inches broad; rising from a little where the Jetting on to the end, has somewhat waved or crumpled on the edges, being thick, and of a deep green color: so soft or moist whist it is fresh, that it is almonst like to felt's Ewe, and wilt hardly dry, unless it lies long in the Sun, and will not be fit to be kept, till after many Days drying.

V. The third, or broad and thin Sea Wrack, or Girdle. This is in all things like the last, saving that the Leaves are thinner, broader, and flatter, yet crumpled or waved on the edges, and of a paler green color, which when dry'd, is almonst like unto this Palm. are divided into many Branches, at whose tops, white Flowers and the said Fennel grow. Its Root is manifold, sometimes a Yard, 2, or 3 long, and tender, extending and creeping much about.

VII. The fifth, or Dying Wrack, or red Dying Sea Mops or Alga, the Dyers Sea Wrack. It rises up with 4, 5, 6, or more Stalks, 4, 5, or 6 Inches high, each Stalk spread out into some few Branches, each of which are well reported with a sort of fine Leaves on them, not much unlike to Fennel, of a reddish color, but with some whiteness mixed together. This is used by divers sorts of Mechanics, to strike a deep Crimson color, or red-dish Purple Dye, which will not quickly nor easily decay, but left long.

X. The Places. Most of these are found on our English and Scotch Coasts; but they are also found in the Levant and Mediterranean Seas; and Coasts of other warmer Climates.

X. The Tides. They perish not in Winter, but their chiefest time of Beauty, Life, and Gathering, is in the Summer Season, and latter end of Summer.

XI. The Qualities. Sea Wrack is cold in the first Degree, and dry in the second; Affirming, and Anodyne.
XII. The Specification. Being Applied whilft they are fresh, they alaye Heat and Inflammations, with the Gout, Stop Vomiting, and strengthen the Stomach; and to cleanse, dry, and heal, old running Sores, and old Ulcers.

XIII. The Preparations. You have, 1. The Sea Wreck in substance, either green or dried. 2. A Decoction of the Dying Sea Wreck. 3. A Powder of the Same.

The Virtues.

XIV. The Sea Wreck in substance of the first five Kinds. Whilft fresh and green, being Applied as a Camphor to the Gout, they abate the Inflammation, case the Pain, and remove the Difflicitie, and withal strengthen the Part; but when dry, their chief use, by the Penetants, our Nerves, and others, is, instead of Hay or Straw, to pick up Glades, and other tender VVares, to keep them from breaking; they are also used as Litter for Horses. And being made into a Compot, is an excellent Mixture for barren and worn out Lands. The first of them, which is found in the Mediterranean Sea, is also of use to make a kind of Pot Ash, of which Glasy is made in those Countries; and also Soap: But the same Wreck, found in our North Sea, will do no such thing; as not containing so excellent a Salt, nor so large a quantity of it, as that does which is Gathered in the Laos.

XV. The Decoction of the red Dying Sea Wreck, or Sea Moss. It strengthens the Stomach, is good against the Poison of Vipers, mad Dogs, and other venemous Creatures, and to reftitute the Longings of Women with Child: It cools, drys, binds, and is good against all Fluxes of the Belly, and also kills Worms in Children: and in the Gout, being disseminated therewith, it eases the Pain: drop it into the Eye, it []es the Pain, and allays their heat and inflammation. If it is made with Wine, it stops Vomiting, and admirably strengthens the Stomach. Injected up the Womb, it is good against the Overflowing of the Terms, and the White in Women; and after due Fusing, cures a Gonorrhea in Men; and injected into the Bladder in Men, it is good to cleanse and heal Ulcers in the Neck thereof: foi from a quarter to half a Pint, Morning and Evening. The Decoction in Water, makes an admirable Dye, whereby Silk, Linen, Leather, and many other things, may be Dyed and Stained of a most glorious deep Crimson, or a singular reddish Purple, which will not easily fade, or become dull, but able in its Beauty for a long time.

XVI. The Powder of the red Dying Sea Wreck, or Sea Moss. It has all the Virtues of the foregoing Decoction, being taken inwardly Morning and Night, from half a Dram to 2 Drams; mixed with a little Syrup of Old Gillyflowers, or of Cinnamon, or some such like, and then mixed with a Glafs of Red Port Wine, and so dranke. Taken allo with Wine mixed with Vinegar, or Syrup of Limon, it is a singular thing against Vomiting, Loosening of Food, and weakness of that Bowel. For it strengthens it after a singular manner: Applied allo outwardly, to old running Sores and putrid Ulcers, it cleanses them, drys up the Afflux of Humors, and induces their healing. And given from the Head, it is said to be good against the Stone in the Reins: Injected with Red Port Wine into the Yard and Bladder, it is good to heal Ulcers in the Neck thereof, and to cure a virulent Gonorrhoea, Univerals being first Prepared.

CHAP. DCCL.

Of YARROW, Land, or Mistfoil.

I. The E Names. The Arabians call it Elpis: but in Greek it is called Γυμνωρά, Stratiotes Chiliphyllos: 'Aσβατος Διαφορίζοντας, Achillea Sideritis of Dioscorides: in Latin, Millefolium; Millefolium Minutum; Achillea, Achileus Sideritis: and in English, Yarrow, Mistfoil, and Achilles Woundwort. Many Authors say that Millefolium and Achilles, are one and the same Plant, and the same Herb which one Author calls Millefolium, another calls Achilles: Others say, that Chiliphyllos, or Millefolium, is the general Name, and that Achilles is the proper Name to one of the particular Species; but that how it is, it is certain that all the Terms here have been called by many Authors, by both the Names indifferently; tho' the Name Achillea, has by late Writers, been chiefly applied to our British Species following.

II. The Kinds. It is not our busines here, to enumerate all the Kinds of Yarrow, entreated of by Authors, for as much as the greater part of them are not perfect Strangers here, we shall only describe a few of such as are familiar with us, most known, and which are only or chiefly used in Physick, which are the five following, viz. 1. Millefolium album var. Millefolium album minor, Stratiotes Millefolium; Stratiotes terrigl, Achilles, Achilles Militaris: Our Common White Yarrow. 2. Millefolium album major Baillii, Luzulaequis & Manthii: The Greater White Yarrow. 3. Millefolium rubrum variae, Our Common Red Floweered Yarrow. 4. Millefolium Flori rubro maximum Cuspi, Millefolium maximum: The Great Red Yarrow. 5. Millefolium Noble Virgini, Stratiotes, Sideritis, & Stratos Gigeteri, Millefolium Noble, & Achilles Tiberorum, & Our Common White Woundwort, so called from Achilles, the General of an Army, who applied it for the Curing of his Soldiers Wounds.

The Descriptions.

III. The fifth, or our Common White Woundwort, Yarrow. Its Root consists of many long white Fibres or Strings, spreading far about and deep. It has many Leaves spread upon the Ground, which are long and winged, finely cut into many small parts, exceeding the five Leaves of Tansy. From among which, rise up 2, or 3 round green Stalks, with such like winged Leaves upon them as grow below, but smaller and finer as they approach up to the top, where come forth many small Flowers which are white, and set in a Tuft or Umbel close together, each Flower consisting of 5 round pointed Leaves, with a little yellowish Thrum at the middle, forming somewhat long being rubbed in the Hand, but not unpleasant. Where Note, That there is some Varieties offered in the Flowers, some being more white than others, some also thicker together, and some either greater or smaller than others.

IV. The
Chap. 750. English Herbs.

Yarrow Common.

IV. The second, or Greater White Yarrow. This in its Roots, form of the Leaves and Flowers, and manner of growing, differs not much from the

Yarrow White, Great.

formers, saving that the Stalks and Leaves of this are larger, its green Leaves being as large almost as those of Tanic, the Flowers also being greater, and standing in a larger Umbel, the Smell of which is a little stronger than ordinary.

V. The third, or our common Red Flower'd Yarrow. This differs in nothing, neither in Root, Stalks, Leaves, Flowers, nor manner of growing from the first, or our Common White Yarrow, but only in the color of the Flowers; these being of a deeper or paler red, or almost of a bluish color, the Thrum in the middle being yellow.

VI. The fourth, or Great Red Yarrow. It has as great, and as large Winged Leaves, as the great White Yarrow, (at Sect. IV. above,) but more finely cut in on the edges. The Stalks are as great and as high, Branching forth as their tops, and flowered with large Umbels of red Flowers like unto them, finding that they are of a fair, bright, reddish color, and in some places, with pale yellow Thrums in their middles, which have a pleasing, but small Smell.

VII. The fifth, or Achilles's Noble Woundwort. This Woundwort, or Yarrow of Achilles, has a long, thick, and creeping Root under Ground, which perishes every Year after Seed time. It has many large, thin, or fine cut Leaves lying near the Ground, more finely and deeply cut in, into the middle Rib, and each part divided off, which makes it to differ something from our first Common Yarrow. From among those Leaves, rise up more and taller Stalks, with few smaller Leaves for the lower, and at their tops many Flowers in Tifs together, being both more in number, and larger than our first Common Yarrow, of a whitish or reddish color, with a yellow Thrum in the middle. The whole Plant Smells very sweet.

VIII. The Places. The four first grow all in England, the fifth and third of which, are very common. The fifth is a Stranger with us, being only Nurt'ed in Gardens, and requires a fat Ground and rich Soil.

IX. The Times. They all Flower from the beginning of June, to the end of Summer, viz. till near Bartholomew-Tide.

X. The Qualities. They are cold in the first degree, and dry in the end of the second, or beginning of the third, Allrigent, Glutinative, Antydy, and Vulnerary.

XI. The Specification. They stop Bleeding at Noe or other parts; the Bleeding of Wounds, Pitting Blood, Bloody Flux, and all other Fluxes of Blood, inward or outward. Stop the Courties in Women, and are good to Cure all Simple Green Wounds in a very short time, by drying them, and confounding their Lin's. They are the Thoath-oth, give help in the Colick, and cure the Gonorrhics in Men, and Whites in Women, Univerfuls being permitted.

The Virtues.

XIII. The Cleaned Green Root, or green Leaves. Being chewed in the Mouth, and held against the Teeth for some time, it is said to give ease in the Thoath-oth.
Salmon's Herbal. Lib. I.

C H A P. DCCLI.

OF YARROW WATER.

I. T H E N O M E N. It is called in Greek Μυρολυτις, Μυρολυτις, from the vast abundance of Leaves which it has, as it were a Myrtle, as the word imports: in Latin Myriophyllum, and Millefolium Aquaticum: in English Water Yarrow, and by some Water Tansy.

II. The Kind. Authors have made near a dozen Species of this Plant; but we shall only present you with what are common to us, which are, 1. Myriophyllum Dicentrae & Galium, Millefolium aquaticum vulgarissimum, Millefolium aquaticum Dodonaei, Millefolium aquaticum umbellatum Capillace. brevique folio Babini: Our common Water Yarrow. 2. Millefolium aquaticum Violaceum, Myriophyllum alternatis Althii & Langsdorfi, Myriophyllum equilifolium violaceum Loiselii, Viola aquatic Dodonaei: The Violet Water Yarrow, (by some the VVater Gilliflower, and Water Violet.) 3. Millefolium aquaticum flore allo Chrys., Millefolium aquaticum fumiculatum, vel fumiculoso; Millefolium aquaticum Ranunculorum flore & capitulo, Millefolium Marathippiflorum flore & femina Ranunculorum aquaticum Hesperide folio Labbeii: Crouch, or Excelled Yarrows Water Yarrow.

The Descriptions.

III. The fifth, or our Common Water Yarrow. Its Root is somewhat long, subtile, and slender, with divers Fibres adhering to it. It ripes up with a round straight Stalk, having divers long curving

Yarrow Water, Common.
Leaves at the bottom of it, cut and divided into many fine small Leaves, set on both sides of a middle Rib, like unto the Land Yarrow, but much tenderer, and with at fine Leaves almost as Fennel it self. All the Stalks likewise given such fine Leaves up to the top, where hand or Branches, large tufts of small white Flowers set close together.

IV. The second, or the Violet Water Yarrow. Its Root is very small and, creeping, flowing forth Fibres in many places, and a Bunch of Fibres at its end : From which rise up several long winged Leaves, conflitning of many small Leaves, set on each side of a middle Rib, which are larger and greater than those of the former, of a sad green color. The Stalks, or Stalks, which rise up among them, are bare of Leaves from the bottom to the upper joints.

Yarrow Water Violet.

whereabout grow divers small shrubs and sweet Flowers, something like to Stock Gilliflowers, or Viollets, of a Leave-spike, one row above another, with yellowish Threads in the middle. There is another sort hereof very like it, but that it has larger Wings, and longer jagged Leaves.

V. The third, or Crowfoot, or Fennel Leave'd Water Yarrow. It has a long slender Root, with a fibrous bath or rust at its end. It is a lesser Herb than any of the former, growing only in slender Waters, where it seldom rises above a handful high, with very many, and very fine short Leaves, as small as Camomille, and of a yellowish green color. The short Stalks among them, bear single small white Flowers, resembling the Water Crowfoot, both in the Flowers, and in the same Leaves, but has no broad Leaves at bottom, as the Water Crowfoot has ; it bears also a braid of Seed after the Flower is fall, very like to that of Crowfoot, viz. a small bunch of Seeds set close together.

VI. The Place. The first grows very plentifully about London, even in the Watter, and in many other Parts of England; and so do the other two, in Platy and Wattery places, but the last grows only in the Watter, efpecally being shallow.

VII. The Times. They all Flower from the middle of Summer to the end, viz. from the middle of June to the middle of September, if the Season is warm.

VIII. The Qualities. They are all cold in the first Degree, and dry in the end of the second. Afflicting, Glutinatious, and Vulgaris, is the Specification. They cool, alway inflammations in Wounds and Ulcers, are good against inward falls and Bruises, help the Strangury, and give ease in the Tooth-ach.

The Virtues.

XI. The Liquid Juice. Given from a Spoonful to 2 Spoonfuls or more, mixt with a little Vinegar, it is good against inward Bruises coming by a fall from some high place, and so mixt, being held in the Mouth, it eases the Tooth-ach.

XII. The Decoction in Wine. It has the Virtues of the Juice, and ismented upon inflamed Wounds, it abates the Inflammation, and eases the Pain: Taken with a Scuple, or half a Drum of Salt of Tartar, it opens Obstructions of the Urinary Pal- lipes, and gives ease in the Strangury.

XIII. The Mixture. Take of the Decoction 8 Ounces; Spirit of Wine, an Ounce and half ; Nitre in five Powder, 3 Drums mix and dissolve. Used as a Fomentation, and as a Wash, or Lotion, it gives
Salmon's Herbal. Lib. I.

1294

gives ease in old painful running Sores and Ulcers, allays their inflammations, digests, cleanses, incurs, and heals them.

XIV. The Balium. It digests and softens admirably all running, purrit or filthy, and foul running Sores and Ulcers; and with the Mixture allogening, quickly incurs and heals them.

XV. The Cataplasm. beaten up with Nitre in fine Powder, adding thereto a little Wine Vinegar, and bringing it to a confluidy with Butter flower, and so applied to a Simple recent Contusion, it cures it, hinders the Inflammation, and takes away a hot Fluxion if present: It cures Stomachs, and is truly profitable against the Gout.

CHAP. DCCLII. Of YUCCA; HIUCCA; or, CAZAVI.

I. THE Names. It being to us a Plant of new Invention, it cannot be supposed to have any Greek or Latin Name, but it is called by the Indians Huca, Tacca and Tacca; also Mandanica, Manhub, and Cazavi; many, or all of which Names, are brought into the Roman Tongue, and the last, viz. Cazavi, or Caçavi, is made English.

II. The Kinds. It is divided into the True and Supposititious. The True Tacca, or Cazavi, is 1. Huca, five Tacca, five Mandanica Granuvia Mexicana, foliis Cannabini. The True Indian Cazavi or Tacca, Hemp-Leav'd. 2. Hiucca, five Tacca, five Heisch Americanum, The Mallow-Leav'd Indian Cazavi, or Potato-like Cazavi. 3. Tacca, foliis Abies, five Tacca India patata, The Supposititious Indian Cazavi: This is not the True Tacca, or Cazavi of Overseas, Tho'ert, and others, of which the Bread Cazavi is made, as Alonso de has plainly demonstrated, for the True Tacca is the Hemp-Leav'd Tacca, first Named, its leaves being divided into 7, 8, or 9 parts, standing on long Footstalks, as immediately will be declared.

The Descriptions.

III. The first, or True Indian Yucca, or Cazavi. It has a pretty great long Root, as great as that of a large Carrot, broad on the outside, and very white within, soft Suppy, and full of a Fleshy Substance. This Root is Planted every Year, or every other Year, and quickly grows to be very great or large, and long utmost. From this Root Springs forth one or more woody Stalks, of 4, 5, or more Feet high, growing up to be as it were a small Shrub. Upon the Stalks grow many fair broad Leaves, each upon a long Footstalk, and divided into 5, 6, 7, or more parts, or single Leaves as it were, not much unlike to Helloborhe, or Hemp-Leaves, (scheme it has part of its Name,) which Leaves are about 6 inches long, two inches or more broad, not indurated, but even about the edges, and abiding constantly. The Stalk is divided into divers unequal Branches, bearing many pretty large Flowers. Spotted a little, they are narrow at their bottoms, long and sharp pointed, and are in number fix, white on the inside, but of a dead brownish white color on the outside, so that if it is a Flower of no great Beauty, and it is only to be esteemed as Exotic rarity.

IV. The second, or Mallow-Leav'd Indian Cazavi, or Potato-like Cazavi, or Yucca. This has a Root 5, 6, 7, 8, or 9 Inches long, and sometimes longer, great and thick at its top, and sharp pointed at the bottom, very like to those of the great Yucca. This Plant is of two forms, viz. one which is yellowish, and another which is white, when they are Boiled or Baked into Bread. From the top of this Root, springs forth many long, flender, tender weak Branches of Leaves, some of them being very long, and some much shorter, some not a half, and some not a third part of the length of the longer Stalks of Leaves. These Stalks have each of them at their extremities, one large Leaf, much larger than those which grow below them, about the middle, or other parts of the Stalk, which are not a quarter part, and many times not an eighth part, or tenth part of the Magnitude of the great Leaf at the end of the Stalk, but which, both greater and smaller, are roundish, with some resemblance of a Mallow-Leaf, whence some part of the Name. These Stalks of Leaves are so weak, that the longer of them never grow upright, but always trail upon the Ground, and the very shortest of them lean much, never growing perfectly upright, but in a declining posture.

V. The third, or Supposititious Indian Cazavi. It has a great thick, and withal long tuberous Root, spreading it self out in time, into many other Tuberoius Heads, from whence shoot forth many long, hard, and bollous, or narrow Guttered Leaves, of a

Yucca Supposititious.

thick Substance, sharp edged, and sharp pointed, encircling one another at the bottom, of a grayish green color, abiding fresh continually, or seldom falling away, with several hard Throats running in or through them length ways, which being withered, become plant white, to bind things up with. From the middle of this Bunch of Leaves, springs up a strong round Stalk, and that every Year,
Year, in the Native Places of its Growth, (but not every Tree with us, in our Colder Climates,) which Stanford, Quercus, or Branche, on which grow divers Flowers, somewhat large, and bearing downturned, confiding of six Leaves, with divers Vermis, of a weak reddish or black color, fixed, or rather united, to three central Leaves, from the middle to the bottom, but not reaching to the edge of any Leaf. These Flowers abide not long, but quickly fall away, without bearing any Seed in our Cold Countries.

VI. This Plant is thus described by Gerard. It has a great Root, thick and Tuberous, very rotty, and full of Juice, which is somewhat fultan in Toffee, but of a Venereous Quality. From which Root, rises up immediately very many Leaves round the head thereof, the Stalks of which are about a Cubit long, beloved like a Garter or Trough, very frowny, and of a green color, like unto that of Wood. The edges of the Leaves are sharp, like the edge of a Knife, and of a brown color. The point of the Leaf is a Prickish, as sharp as a Needle, and the edges is not much unlike to a Whorry, or some fuch like Blade. These Leaves are also very tough, hard to break, and not easy to be cut, except the Knife be very sharp. To this Plant, when young, and before the further Add, in some Years (fays he,) it puts forth a pretty fufft, round Stalk, some three Cubits high, divided into divers unequal Branches, carrying large, round, and very pretty large Flowers, shaped somewhat like thofe of Fiddularia, but that they are narrower at their bottoms; the Leaves of the Flower are few in number, which are of a white color on their infide, but on the outside, of an over- grown reddish color, from the Poftid to the middle of the Leaf, fo that it is a Flower of no great Beauty, but is only efteemed for its Rovi.

VII. The Places. The two fift grow in most places of America, from Florida to Peru, and about the Straights of Magellan, as also in the Islands of the Ocean, as in Jamaica, Barbadoes, and others of the Caribbe and Lennard Islands, even in thofe places where they had Mefon, or Indian Wheat. The third or half of them, grows also in all, or most places in the south-ward Indices, where the two former grow, from the Southern parts of Brazil and Chile, to the Cape of Florida, and in most of the Caribbe Islands, and other Countries adjacent to them, as Florida in our English Plantations, as in Virginia, Maryland, New-England, &c. as it is confidently affirmed.

VIII. The Trees. The Siftes wherein the fift and fect Flowcr and Seed are uncertain, and perhaps thereof and Authors have faid nothing. The third or half, Flowers about the middle or latter end of July, the Flowers falling away within a little time after they have been blown open, but as for its Seed, it has never been obferved to come to perfection with us. As to its Leaves, Gerard fays that they kept Green both Winter and Summer, in his Garden, without any covering upon them to defend them, notwithstanding the injury or infallicity of our cold Climate.

IX. The Order. Of these forts of Plants, the Roots are only of use. The Juice of the fift is hot and dry in the fourth degree; Volatile in the highest degree; Deleterious or Poisonous; and, when Boiled mildly, it is cold, moist, and mitigated. When Boiled strongly, it is hot and moist, but when dry, or reduced into Flowcr, it is temperate in regard to heat or coldness, dryness or moisture, being perfectly free from any heat or moisture, which is proper for Food and Nourishment of the Body. The Juice of the second, is affirmed by Rome to be free from any Poisonous or hurtful Qualities, whereas others say, that he has the fame Deleterious Quality with the fift, and that he know nothing of it by Experience, but if the Root is of the nature of Spanish Potassium, as is affirmed, it muft be innocent enough, and the Root itself, answers all the Intention of the Plant. The New-Jersey, or fosse Juice of the third, is said to be Deadly, or very dangerous, like to the Juice of the fift. Alfo an: relates, that a Wound made in his Hand by the sharp Prickles or points at the Leaks end, gave him such intolerable Pains as almost Distracted him, (which shews the Maliginity of its Subtil and Volatile parts,) and that he could have no ease till he applied his own Blood thereto, which cured it. But the dried Root, or the Flower thereof, is innocent, temperate as to heat or cold, and dry in the fift degree, fit to make Food of, in like manner as the fift.

X. The Specification. Authors have affribed no Virtues to these Plants, but if we may make an Estimate of them, from the confideration of their Roots being received as Food, and nourifhing Man, they are fuch that, making him to increase in Substance and Strength, it is rational to believe that they are refreffive in Consumptions, vomitings, and refpiratory and weak and decayed Nerves, accordingly as they may be applied to thofe purpofes: And as they are of a dying Quality, to they may be Aftringent, and so be prepar'd to Stop Fluxes of the Blood; this we speak as to the Root itfelf. And as to the Juice, when it is well prepar'd, we refer them to the Deleterious or Poisonous Qualities, it may be of excellent ufue to allay the heat of Fevers, quench Thirst, cure foul Mouths and Throat, and the like; as alfo to clear and refrefl the Viral Splitts, when oppreffed and weakned thro' Cares, Affections, Melancholy, Perturbations of the Mind, or any prefent Heterogeneous matter deftruing them.

XI. The Preparations. You may prepare from the Jucces of all thofe Plants, but especially from the Juice of the fift of them, 1. A Drink. 2. A Vinegar. 3. A Rob or Sopa. And from the dried Root, 1. Aflower. 2. Cazavi, or a Red White fort of Bread, the like of which is prepared from both the fecd and third firth also.

XII. An Observation. That the Juice of the fift of these Plants, (if not of the other two) is an Egregious Pollon, exported by the Author to the prejudice of the Body, as many of Authors, has sufficiently a~certained; and that it is a Pollon of that induleitate Efficacy, that it certainly Kills in a very fhort time after the taking of it; whilst the Root by itfelf is as fit, and the Juice when sufficiently boiled, have not the leit of any fuch Qualities in them, the daily Eating and Drinking of them for many Years, have affurd us that they have no malignant or hurtful Qualities in them, but absolutely on the contrary, are Confervatory to the Health, Strength and Life of Mankind, which ferve to be a kind of Paradife, since other Poftions, either drying, boils, or even burning, can alter their innate Properties. The like is to be faid of Opium, that the Powder of that Succulent Gum being gradually dryed, has not the leit Deleterious property in it, (what ever it had before) but on the contrary, instead of making Sick at Stomach, couuing Vomiting, Convulsions, Compressions, and Eruptions (as it has done in multitudes of People,) does relieve and comfort the Tones of the Stomach, chear and enliven the Patient, and provifges the prefent Evil beyond all that possibly he could do, whilst it is contained within in it, its Nature Adulterous humidity, this is a Note worthy of Observation.

XIII. It
Salmon's Herbal.

Lib. I.

XIII. It may then be demanded how these things come to be freed from those their Deadly Quali-
ties. To which I answer, That their Poisons are Volatiles, highly Volatile, Volatile even in the high-
col degree, which by the means of the heat of the Fire, or Subtil Attractions, properties of the Air, are
made to evaporate, and fly away, and to clear the remaining parts of the matter, and make it abso-
lutely free from any hurtful or evil Qualities, whereas had that Poison been in, and essentially incor-
pored into the Substane of the matter, every Particle thereof would have had the same Propo-
sities, nor could any Evaporation, drying, or even burning it, have allured it, but that it would have been inevitably by the same, as long as it could not confirm itself in the World, of which Truth, and matter of Fact, many Examples are easily to be given.

The Virtues.

XIV. The Drink. It is made of the express'd Juice of the Root, which when it is now prel, has an evil Smell, and of such hurtful Quali-
ties, that a proper Additament should tell it of, whether Man or Beast, dies without Remedy, and that quickly. The kind of the Root is first pared away, then the Root is left either scraped, or broken into small bits, and bruised, often it may be put into a Linen cloth or Bag, or some other proper Strainer, and is express'd by the help of a Press, &c. This Juice they take, and boil it half away, which afterwards by a very gentle Fermentation, becomes a proper Drink, like a middle-
lar of Ale. It quenches Thirst admirably, cools in Fevers, more especially if the Juice of a Lemon or Orange is added to it: It cleanses the System, and quenches Thirst, and kills the Foul-
ety or putrid and pestilential Distfections. As made very sweet with Honey, it makes an excellent Gar-
gurin for a Fore Mouth or Throat, and to cleanse and heal Ulcers in those parts.

XV. The Vinegar. It is made of the express'd Juice, by setting it in the Sun till it becomes aci-
d, and as sharp as the best Wine Vinegar. Authors say, that the Vinegar made hence, is full as good as that which is made of Wine. It cools in Fevers, and quenches Thirst, and is admirable against ma-
lign and Pestilential Distfections. It may be made into a Syrup with Honey, or a double refined Suger, which drank in mixt with Water, or other proper Liquid, cools singularly, any heat or Inflammation of the Viscera, opens obstructions of the Lungs, and causes free breathing. It likewise heats all sorts of Sores, Cancers, and Ulcers of the Mouth and Throat, cleansing and drying them; and also alleviating any Inflammation in those places.

XVI. The Bob or Sopa. It is made of the Juice boiled to the thickness of new Honey. When it is so Boiled, to such a Conspicuity of a Quiddity, it is (as Authors say) as sweet as Honey. Of this, a kind of Mead may be made, by mixing it with Water in the same proportion, as you use of Honey, when you make Mead thereof. But if the quantity of this Bob or Sopa, be half as much more, it will make the Drink so much the stronger, and more plea-
sant withall. It is a pleasing sort of Liquor, to
drink in hot Weather, to refrigurate or cool, and quench Thirst.

XVII. The Flower of the Root. It is made by
expressing the Juice, and then drying it more the remainder; after which, it is reduced to a fine and Subtil Powder, either by Grinding, or by beating it in a Mortar, and continually Stifting it, till the whole Mass is reduced to such a Subtil Conspicuity. Some only flies the Root into very thin Silices, which they let edge-wise, so that the Juice may drain out of its own accord, and continue thus standing till it is thord dry, after which, they break it into small bits with their Fingers, and then either by a proper Mill, or by beating in a Mortar, reduced it to fine Flour or Powder. This Powder, flower with Milk, Eggs, &c. they make Cakes, Pan-Cakes, Puddings, Cheesecakes, &c. as it usu-
ally done with Wheat Flower, which are very fine, Palatable, good and nourishing, and very suit-
able to the Bodies of Human kind.

XVIII. Cazavi, or the Bread. It is made of the
afcorned fine Flower with Water, or rather No-
Dulk, either alone, or adding Yealt, Eggs, &c. They may make the Bread light and pleasant; which they form into little, thin, small Leaves at Pleasure, and so gently Bake them, which Bread seems to be almost as white as Snow. This makes, in some cases, a very pleasant, palatable, and agreeable to the Stomach, and what the Necessity Appetite will not refuse. And when Stale, very good and pleasant, tho' not so
taking. This Bread will keep good for a long time, even twenty Years without corrupting, and give good Nourishment to the Body.

XIX. Of this Root, the Americans, or West-
Indians in many places, (tho' they had Noce, or
Indian Wheat in great plenty,) did make their Bread, on which they Lived, after the former manner, and that (as they say,) for five hundred or six hundred Years. Which Bread was made of Suger, from the root of this kind of America, from the most Southern parts of Chili and Peru, even to the Northern parts of Florida, or New-England.

XX. The way and manner of Planting and Prop-
gating, is this. Of the first sort or kind, they cut off a Stalk about a Foot long, which they put
more than half way into the Ground, where it suddenly takes Root, and within a Year or little
more, the Root comes to be bulky, very great, and
fit to be taken up for the uses above mentioned. The
second kind is Planted from the Root cut into many
pieces, each piece having some of the outside
thoraces. These pieces they put each into a hole in
the Earth, made fit for them, which in a Year of time or less, grow to their full Magnitude,
and are fit for taking up, and to be prepared for Food.

Finis, 25 Decemb. 1708.

Index Plantarum

Vetch Bird’s-Feet Knotted, *Glycyrrhiza inuliscia*.

Star Codded, *Stella Leguminosae*.

Liquorice like, — *Glycyrrhiza*.

Vetch Bitter, *Orobus, (Eremus Fistula minor, 723.

Garden, *Orobus burtenga, Orobus vulgaris, Eruptrum, Mohus*.

Candy, — *Caryota*.

Wild, — *Spartium, Eremus Sylvestre, Car- nassis Gerani, Laburus Sylvestris minor*.

Wood, *Orobus Sybaris, 

Wood Broad Leaved, — *finifolia, Phoebus Labiatae, Phoebus Sybaris, Arcturus Donatae*.

Wood Narrow Leaved, — *Angustifolius, Orobus Sylvestris minor*.

Vine, Prickly, *Vitis filia lactinata*.

Wild Beren, *Vitis Sylvestri — Serpula*.

Vine white, *Bryonia white, Bryonia, vol. vitis alba, 89*.

Violet Garden, *Viola hortensis, — purpurea — Martis, 725*.

Wild Upright, *Viola Sylvestris purpurea, — aberfores, — fratris, — Blunt*.

Violet Toothed, *Coriolipect, Viola Dentata, Cor- ralleides, 152*.

Violets Corn, *Viole arvensis, — pentagonia, — Setonem Ombrhemys, & Companula arven- sis, 726*.

Dit, *Hesperis, Viola Matronalis, — Hymenae, — Dunsfio, — Mychthela*.

Dames Purple Double, *Hesperis flore plano purpureo*

Vipers Grass, *Zypern, Viperaria, Viperina, Scorzonera, 727*.

Vipers Bugloss, *Bugloss Vipers, Echinum, Buglossum, Viperina, 727*.

Virginia Creeper, — *Climer, Vitis vel Hedera Virginianae, 726*.

Virginia Silk-Grass, — *Periploca Virginiana, 727*.

Greater or Upright, — *reilla, — major*.

Smaller, *Periploca Virginiana minor*.

Virginia Bower, Ladies Bowers, or Climes, *Clematis, 420*.

Burning or Caudick, *Clematis Uren*.

Red Flowered, *Clematis peregrina*.

Purple, — *peregrina flore purpureo*.

Purple Double, — *purpureo plano*.

Sea Creeping, — *Maritima repens*.

Virginia, — *Virginia*.

Upright, *Flammula juncus sylvestri*.

W.

Watte, *Cockouin Fint, Successus penis Arum, 730*.

Not Spotted, *Arum non Maculatum*.

Spotted, *Arum Maculatum*.

Hooded, *Arums Coolea, Arums Coolea, 727*.

Wall-Flower, *Keiri, Cerisia Leucotus latea, 723*.

Single Flowered, — *flore simplici*.

Double Flowered, — *flore pleno*

Wall-Flower, *Navel繁荣, Narbcw, Umbel- lae Petasitis, Acalyphum, 727*.

Wall Rue, *Milden Hair-wite, Adiantum album, Pe- lyticrium album, Copius Petasitis albus, 485*.

Wart Tunfole, *Tunfole Wort, Helieropum, Turrucron, 717, Sect. 2*.

Wartwort, *Bucksest Bird’s Foot, Cebiolum Per- rucron, 717, Sect. 2*.

Wheat Common, *Triticum, Silica, 723*.

Red, *Triticum albina rubra — rubra rubris. Red not Aproved, — fiscia multia*. White, — *albus, arillus albus, Siligo, arillus minus*

White not Aproved, — *albus multia, Siligo, fiscia multia*.

Many Eared, — *Spicae multiplices, ramusum*.

Whitlow Grass, *Nillwort, Eupatorium, 725*.

Rue Leaved, — *folio Baccate*.

Marth, — *paludris, Acinamara palustris, Viola Iese palustris, Vaccinum palustris, Oxycema Cordis*.

Widow’s, *Spinge Olire, Messen, Cham.eu, Thyare, 677*.

Williams Sweet Garden, *Armeria, Caryophyllus Sylvestris, 727*.

Broad Leaved Single, — *laitfolis simplex*.

Narrow Leaved Single, — *angustifolius simplex*.

Double Flowered, — *angustifolius duplex*.

Wind-Flower, *Anemone, Herba venti, Anemone, 12, 13, 728*.

Broad Leaved Single Flowered, *Anemone, fiscia multia*

Broad Leaved Double Flowered, — *fiscia multiplieii*.

Narrow Leaved Single, — *angustifolia fiscia simplex*.

Narrow Leaved Double, — *duplices, fiscia plano*.

Winter Green, *Pyrola, 720*.

Our Winter Green, *Pyrola nofrs vulgaris*.

European, *Pyrola European florae minus*.

Wood Garden, *Gigas Sativum, floris Satica*.

Wild, — *Sylvaticus, floris agritis 720*.

Common, *Affersulae, Aferpern edoceana nofrs*.

Blew Flowered, — *flore Careulis, Ceralea avuncini*.

Break Stone, *Affersulae repens, Tuncaria Tu- bermannoni, Rubia finifolia offe*.

Wolfs Bane Deadly, *Aconitum, Lautaria, Lycollco- men, Quioleon, 724*.

Winter, *Aconitum Elyanidae*.

White Fish, — *luteum ponticum prece. Late Flowering, — Ponticum Serenimum, Greater Larks Head, — *flore Confidentia regalis, Cornutum Cau*.

Larker Larks Head, — *flore Delphinii minus, — flore Confidentia regalis, Cornutum minus*.

Wolfs Bane Antelope, *Aconitum, 727*.

Roman, *Vapero, Vulgare, Vulgare, 727*.

Lefler, — *minus, Plantaginis foliis, Scorpion Rooted, — brachlia radice*.

English
Index Plantarum.

Englifh, or German, Alhina Williamsianum Matthiolii & Dioscoridis. Of the Shops, Domestici & Officinalum.

English Wild, or Wild Gold of Pfenure, Moghrum Syrofide, Pyrodygnumoram.

Wound-wort, All-Heal, Panix, Panaces, 748. Hercules, — Heracleum verum, Panaces Heraclea vera.

Asceophora, Asceophora, Sorrel, Saffra bedez, Field Sorrel.
Index Latinus.

Acris Bevis, Anonin, Remanum Aratii, Reit-Harroum, Camouch.

Artemisia, Baffard Wild Poppy, some take it for Wild Water, Barberry-bush.

Artemisia-Antarctica, Wild Tansy.

Artemisiafruits, Frian Cowle, Hooded Wake Robin, or Cuckow-Pint.

Artemisia, Birthwort.

Artemisia, Oregan, Oregan is accounted the best in the West.

Armeria, Annetoria, Carphophyly Sylvestris, Sweet Williams.

Armeria, VVild Williams.

Arachis, Rapheus Sylvestris, VVild Radifh.

Arachis, Plantago, Humiferosus, Plantane, or Aquifolium, Rib-wort Plantane.

Artemisia, Mug-wort.

Artemisia, Sei Mug-wort.

Artemisia, Patrin Pataspinum, Cyclamen, Cyclamhus, Scowbird.

Arctiuos, Frinuus Veris, Paradoxy Herba minor, Althiis Sylvestris, Primrose.

Arum, Smeevisus Eire, Wake Robin, Cuckow-plint.

Arum, Egypium, Edes of Carolina.

Arundo, Colonum, Reed, Pool Reed.

— Major, Colonum major, Arundo Donax, Cane, or Cane Reed.

Arum, Persperfis, Northera Radix, Affrales.

— Sylophere, Sylphe, VVild Affrales.

Alicandrum, Scollium, One of the Kinds of Onions.

Alicipha Sylvestris, Alcmaria Sylvestris, Alcmaria antiquis, Swal.

Alysum, Peters wort, Square Johns Graff.

Alysum, Lignum Rhodium, Rope Wood.

Alyssum, Horecunum, Afpangus Garden.

— Sylphere, VVild Afpangus.

— Paslphere — Marthinus, Marth Afpangus.

Alyssum, Apyrites, Clivers.

A_sleepus, Alpargus communis, Woodroof.

— Pur, Cervix, Blew flowered VVoodroof.

— Repens — Tanairia, Riba lingulata after, VVoodroof, Break-iron.

Alyssum, Alphodelia, Alphodelia.

Alyssum lateus, Hufa Regis, Kings Spear.

— Babyfus, Hyscinthus, Onion Alphodelia.

— Palphier, Erado Alphodelia, VVild or Marth.

Alyssum, Celtsch, Spilen-wort, Mil-wafte.

— Tober, Cervix, True Spilen-wort, or Mil-wafte.

Atherum, Baboumum, Ingualitis, Star-wort.

— Altherum, Baboumum, Purple Italian Star-wort, or Purple Minigold.

Atherereus nothus, Milk Vetee.

Athereres, Herberarumus, idem.

— Altherereus, Baffard Milk Vetee.

Altherereus, Imperatoris, Milte-worfe.

Altherum, After Altherum, Greek Star-wort, True or Yellow Star-wort.

— Altherum, Baboumum, True-Baume Star-wort.

Altherum, Sambucus, Sthrubala, Caldoniy, French Lavender.

Althereria, tenaxtum Sylvestre, Tansie.

— Syltum, Crispus, Crifeed Tansie.

— Largauge, VVooly Tansie.

— Veufchel, Purpory colored Tansie.

Althea, A Pultage or Frummece made of Zca, or our Grey VVitch Beter.

Althofyll, Cynna vel Carumbus Sylvestris, VVild Baffard Saffron.

Althofyll, Sylvestris, Anch, or Orach.

Althofyll, Humifera, Garden Arach.

— Sylphere, VVild Arach, All-feet.

— Frols, thinking Arach.

— Mafiae, Sei Arach.

— Ovata, Tiffard Tree.

— Sylophere, Spike Tree.

Ammos, Oats.

— Sylphere, VVild Oats.

Ammos, Aina nigra, Black Alder.

Ammos, ph Avantiiis, Oregan, Oreganes.

Ammos, Oliis, Ar sympathetic, Garden Arach.

Ammos, Anaphlaeus auris, Steclae Curatu, Yellow Sylveflrae, Gold Locks, Golden Flower 

Ammolsh Urfi, Sylveflrae, Bears Ear.

Ammolsh Moris, Filifolia Myrtis, Monk Ear.

Ammolsh Lopritis, Buphuran, Hares Ear.

B

Acharitis affinic, Amoou, Aflhabacca.

Baccharis, Moatdendriens, Flowcrwans Sylph.

Balsamum, Pomegranate Flower.

Balleris, Marrabium migrans, Black Horehound.

Balfoum, Baffard.

Balka, Arum, Sylveflrae, Sedum, Houtsebeck, or Alle Wake Robin, or Cuckow-plint.

Balka, Hires, Troppopon, Goats Beard, Noon Flower.

Balka, Sylveflrae, Sedum, Great Houtsebeck.

Balka, Nahrung, Hyperbora, Buck Crop, Winter Creaf.

Bardana, Loppa major, Persofana, Bur-dock Great.

Bafis, Givoria, Gentian or Fall-wort.

Bafis, Balfamnus, Oxymum, Balf Garden.

— Citrum, Citron Baff.

— Cypholabium, Clove Baff.

— Sylphere, VVild Baff.

Barterium, Romaleas, Crow-foot.

— Horecunum, Garden.

— Alus vel arveum, Field Crow-foot.

— Alus, VVood Crow-foot.

— Apus — Falus, Wart Crow-foot.

Batus, Rades Sylophere, Bramble-buff.

Batus, Papd Angloica vel Heribarum, Batturas, Potatoes English or Buff.

— Hispanmum, Spanish Potatoes.

— Virginiana, Virginia Potatoes.

Beechum, Angelia aquatica, Brook-lime.

Beechum, Forfum, Tapfeg, Cotton-lime.

Beechum, Rafa Equitarios, Rafa Sylophere, Bale-lime.

Beneh almond, Fagnum flammeum, Splinter Poppy.

Bella — Horecunum, Great Daily or Maud-borre.

Beneden, Benjamin.

Berknefris, Burbery-buff.

Beltulis, Beechum, Angelia aquatica, Brook-lime.

Beta alba, Slica, Slica, Bent White.

— cubra vel nigra, Red Beat.

— Ronns, Roman Beat.

Betonic, Bencroy.

— Aquatic, Water Betony.

Betonic, Paulii, Veración mas, Pauls Botony, Speed-well.

Betula, Birch Tree.

Bifolium, Ophris, Twa-blaide, or Bififil.

— Palphis, Martha Twa-blaide.

Bipinnella, Sylveflre, Burner.

— Sjacfaja, Burner Sixtinge.

Bifacium, Sycvra, Toothpick Cherri.

Biflinga, Hippoglossum, Horfe Tongue.

Bisaurias, Dramatulius, Dragons.

Aquatic, Water Burch.

Battaria,
Index Latinus.

Bletoria, Moth Mullein.
Beton, Feltigum, Penny-royal.
Biliana album, Blite White.
Bisannaria, Birthwort.

Caesatius, Thymatium, Lathyrus, Lathiris, Spurge.
Catathasis, Erionum Sylvestris, Crumion Graps Vetch.
Catarius, Nepeta, Myrtus Catarius, Nepot or Cat Mint.
Catharum, Abrotanum, Southern wood.
Catena, HEDGE Parly.
Cacsofin, Ably Indicum, Indian Moly.
Cauda Maris, Holophorum Lentice, Mount Tail.
Caudupinum, Cole Rapes, Rape Seed Cole.
Cauda equalis, Equetum, Horse Tail.
Causa Pinta, idem.
Cauda Vulpinum, vel Vulpinum, Alopeconus, Fox Tail.
Caerulea, Bifolia, Crampa, Cole-wort, Cabbage.
Causa capitulator, Cabbage.
Cenani, Cetaria, lucce, Lucid Breed.
Cedrus, Cedar Tree.
Canarium major, Century.
Alnus, Leffer Canora.
Cantharorbis, Nannostyris, Many-wort.
Centunculus, Plantago major, Greater Plantain.
Centanis, Allium, Millet.
Centranympha, Aconor, Benignum, Ruffese, Butch-

er's Bozen.
Centrula, Gallum, Herminum, Sclarea, Clary.
Centromedia, Polygona, Knot-grass.
Alnus, Rushwell.
Centunculata, Graphophyllum, Glad-i-wort.
Impiur,— mayor, Vicked Caudeweed.
Marina, Sea Glad-i-wort.
Americana, Argyrocoma, American Glad-i-wort.
Capsa, Cepa, Cape, Onidan.
Affoditica, Affodirum, Scallions.
Cesara, Telephiunum, Cradfulum, Orine of Matthotis.
Cerae, Cherry.
Ceratonia, Corde, Joans Breed.
Cerassum, — Hortense, Chervil.
Magnus, Myrillis, Sweet Ciferey.
Sylvophyllum, V万达l Chervil.
Excelsa, Qudysium, Toothpick Chervil.
Ceratitale, Herba maris, Hony-wort.
Cemicum, Graffiti, Telephiunum, Eborina, Orine.
Cesia, Ducens, Candy Vindl Carrot.
Cecinaria, Tricubulum, Campanula solius Ursica,
Throat-wort.
Major, Campanula major, Canterbury Bells.
Cerus major, Cherri, Ceti, Croton, Picceans, Rici-

us, Palmus Christi, Great Spurge.
Cesflon, Betonica, Betony.
Aquaticum, VVater Betony.
Cesfum maritum, Typho, Trypto aquatics, Cats Tail,
Seed Mix.
Ceterace Afrodita, True Spleen-wort, Milh
Waffe.
Scopelendrium, True Spleen-wort.
Chamaelea, Echres, Dwarf Elder, Dane-wort.
Chamaemelus, Dwarf Cifus, English Cifus.
Chamaders, Triaca, Teucarium, Quecula — minor,
Germanum.
Sylvillus, Vindl Germanu.
Agnusis, Scordium, Vindl Germanu.
Chamagrephis, Gentia hamalis, Common Room;
a Dwarf Kind.
Chameris major, Dwarf Flower-de-luce Greener.
Minor, Dwarf Flower-de-luce Leffer.
Chamaemorphy, Chamomilla, Anthemis, Camomil.
Chameter Gemonia, Typhusa, Hacerrum, Meze-

cons, Sheaf Spurge Olive, Vindl Wall.
Chamamelum, Coccus citrinus, Oleage, Olea-

felter, Vindl Wall, Spurge Olive.
Chamamoric, Limaria Pumila, Dwarf Flax.
Recept, Typhumolium repent, Elux-weapon.
Chamamorphy, Radus Trioceres, Knot Berry Brat.
Dewberry.
Chamaemorphy, Lonicera (figuina), Coded Loof-

frife, or Vindl Herb.
Chamaphyse, Res arbitricus, Abies, Ground Pine.
Marisacetis, Set Ground Pine.
Chamaemulodendron, Dwarf Nok Bay.
Chamaphyse, Dwarf Box.
Chamaphyse, Helcura terrestris, Ground Ivy, Ale-

boo.
Alnus, Small Ale-boo.
Alantus, Mountain Ale-boo.
Chamaelone, Lutorica, Lawrell, Balfour Bay.
Chamaclark, Forphi, Echinus, Tagapage, Coles foot.
Chamaegyne, Myrrus Brachia, Vindl Syzygiis, Sweet Gaul.
Chamaelone, Ceratium Syzygiis, Chervil Vindl.
Chamaelone, Erynium, Simpii alpestr, Hedge Mu-

fard.
Pisum, True Hedge Muffard.
Chamaelone, Chamaelaicon, Anthems, Camomil.
Chamaepru, Poparin, Paper Reed.
Chatil, Camum, Capron, Cucumber.
Chelidonium, Hieracium, Calendine.
Cheris, Lecumum Lacerum, Wall-flower.
Chermopis, Simple Wall-flower.
Pere Pilem, Double Wall-flower.
Chervus, Ricinus, Palmus Christi, Great Spurge.
Chernus, Sicilina, under moris, Vindl nigra, Bry-

nias nigra, Black Berry.
Chocolate, Chocolate made of the Nut Cocos, that
made of the Caneca Nuts is the best.
Chisini, Adonis, Major Fumifloris, Marsh-millow.
Chondroly, Gum Succory.
Vera, — Graec, True Gum, Succory.
Chrysophlorious Herb, Herba christophor, Herb
Christopher.
Chrysonemum Segera, Corn Marigold.
Chrysogena, Leontopodium, Oaken black Tunmp,
Lions Foot, 446.
Chrysolobanum, Asterspha fatua, Garden Ach.
Chrysophyllum, Malus Armenica, Apricock.
Chertispo, Sambucus levis, Smooth Stew Thistle.
Cicti, Ricinus, Kerus, Cheros, Croton, Picceans,
Palmus Christi, Great Spurge.
Cicer, Cicer Sacrum, Chibb peale or Gilches.
Sylvillus, Vindl Chibb Peafe.
Ciborium, Ciborium, Calcare, Succory.
Hortensis, Garden Succory.
Sylvillus, Vindl Succory.
Nitrum, Balfour Succory.
Ciborium Ferrucrecum, VVart Succory.
Porcius, Swines Succory.
Gammath, Chondrito, Gum Succory.
Cladis, VHero, Beet.
Atha, VWhite Beet.
Ratra, Red Beet.
Citana, Camum, Hemlock.
Alurs, — saxis, — Apfle folis, Parly
Leivd Hemlock.
Aquaticus Pohlibris, VVater Hemlock.
Gaieteria, Sprengere, Supremum, Myrillis, Cleely.
Alnus, Greater Sweet Cleely.
Minor, Leffer Sweet Cleely.
Cidromelum, Malum Medium, Etranglimon, Citizen.
Turtica, Great Round Headed Citizen, the
Shadlock.
Criminalis, Gentianis, Felwort or Gentian.
Major, Greater Gentian.
Alum Gentiana, Lesser Gentian.
Alurn crinitis, Crofs-wort Gentian.
Cinacellum, Capitale Herbae, Mirlch-burr.
Nigra, Tribocons, Black Maiden-hair.
Alnus, White Maiden-hair.

Ferrius, Idem.

Forfus, Paphus, White Poplar.

Ferrous, Calthea paludifera, Marsh Marigold.

Ferrago, Scalce, Rie.

For, Spetka, Zies, Triumfl Grjeim, — Cono- reum artificium monius, Sple, our Grey Wheat.

Ephedus, Phelodex, Smilan hortensis, Kidney Bean.

Fellenius, Fellenius, Fellenius Bean Garden.

Equinum, — minor, Field or Horse Bean.

Fħerfrīnas, Matricaria, Patricium, Feverfew, Fetherfew.

Syngenstein — agarictis, Wild Feverfew.

Fagopyrum, Tragopyrum, Tragopyrum, Ocyum Cereal.

Vet terre, Centaurium minus, Leef Centy.

Verara, Spur, Agrinonia, Agrimony.

Notul, Agrimonioides, Baffard Agrimony.

Ferulatos, Thompson, Great Souching Fennel.

Fenninum, Sola Equinum, Horse-shoe Vetch.

Ferahlia, Yendi Gigant.

Ferulogia, Ferula minor, Small Fennel Giant.

Verula Galbanifera, Ferula yielding Galbanum.

Verula Spurgesphera, Ferula yielding Spergesnum.

Pellicia, Bromus sterilis, Agios, Wild Oats.

Pellicia Hilernal, Hay-graff.

Ferratia, Calthodium minus, Scrophularia, Filewort, called also the Leef Calthana.

Ficus, A Fig, also a Fig Tree.

Ficus bummalis, Chamomali, Dwarf Fig Tree.

Pilag, Tomentum, Buck Wheat.

Aurea, — aureum, Golden Cud-weed.

Marina, Sea Cud-weed.

Artis, — minor, Wicked Herb or Cud-weed.

Argentea, — Americanus, Silver Cudweed or American.

Filipendula, Oenantea, Drop-wort.

Aquatica, W. Water Drop-wort.

Angelisilis, April folius, Narrow Leaf V.

Coeae fast, Henlock like Drop-wort.

Ficulina, Podophyllum, Polypody.

Lascerina, Polypody of the Oak.

Aurina, Polypody of the Wall.

Torres, Ground Polypody.

Filius an Festarem, Callistle, Meadow Saffron.

Filius axilum, Eleborum, Pierre, Fern Male.

Fernina, Nympheaster, Female Fern, Brake.

Lascerina, Oak Fern.

Alba, Duggerwort, White Oak Fern.

Filiusflorum, Ofarweds regula, Filius aquis, Water Fern, Osmond Royal.

Filius folia, Philodactila, Idem.

Filiusflorum, Pedicularis, Crista Galli, Cock's-comb.

Coxcomb, Loaf-wort, Yellow Rattle.

Hemmlura, Ranunculus fluminas, Spear-wort.

Hinnatula, Tenuis, Oenone aren, Virgins Bow.

Surrepsa, Upright Virgin's Bower.

Flo Alator, Erigeron, Adonis Flower.

Flore Rubra, Red Flowered Adonis.

Flore lutes, Yellow Flowered Adonis.

Filius umbellus, Amoricae Geissera, Polygalla re- centiorum, Milk-wort Common.

Maritimus, Glauces, Sea Milk-wort.

Filius Curtula, Trachvium Americanus, Cardinal Flower.

Filius Cuculi, Cuculus, Polygonal, Milk-wort.

Filius lutei, Coronas felis, Sol Indiana, Chrysantemum Persicaria, Sun Flower.

Major, maximus Persicaria, The great Sun Flower.

Minor, Chrysanthemum peruvinus minor, The Smaller Pese Sun Flower.

Filius Curtula, Cuculus, Cowcock Flower, Ladies Snocks.

Filius Flumen, Cynus, Blew Flower, Corn Flower.

Multifloras, Double Flowered.

Filius Fladegia, Fladegia, Chequard's Daffodil.

Filius Regia, Candida Regalis, Delphinium, Filis Calcaria, Larks Spur, Larks Heel, Knights Spur.

Filicae Gaei, Revi, Sunrose.

Fornum Grami, Silicus Calamot, Corpos Flumus, Silicea Varrain, Fenugreek.

Fornum Burgundiacum, Medicus legitima, Trifolium Caledoniac, Medex Toddler, S. Petis, Small Clover.

Itasbus, Caderanum, Socory.
Sypho, VVild Socory.
Ion, Viol, Violet.
Horinum, Garden Violet.
Sypho, VVild Violet.
Normo, VVild, Jagged or Carolina
Violet.
Jovis arbors, Quercus, The Oak.
Jovis bares herbae, Scorperium major vulgar.
Our common Houtbeek.

Jovis,
Index Latinus.

Lactarius, Tithymalus, Spurge.
Hortensia, Garden Spurge.
Minor, Equisalvia minor, Small Spurge.
Nemorosa, Tithymalus Villaris, Wood Spurge.
Marina, Herba Lactaria, Tithymalus parietis, Sea Spurge.
Laurela, Daphne, Spurge Lawrel.
Lactuca Leperina, Souchex, Snow Thistle.
Lactuca, Idena.
Lactuca hortensis, Garden Lettuce.
Sycophanta, Wild Lettuce.
Sabalica, Sow Lettuce.
Aginis, Lamb Lettuce, Corn Sallet.
Ladanum, Lobadanum, Gum of the Cittus shrub.
Ladanum, Segerum, Sideritis eronensis, Meadow Teafle.
Lagopus, Lagopodium, Ps Leporis, Trifolium buvoli, Trifolium Trilicum, Hares-foot, or Spiked Trefoil.
Lagopus, Idena.
Lampatan, China radix, China.
Laminum, Archangelica, Galactea, Ortica inr, — morus, Dead Nettle, Archangel.
Album, White Dead Nettle.
Rhubarum, Red Dead Nettle.
Feridum, Stinking Dead Nettle.
Lamprana, Dock Creek.
Linaria, Pfeudolimum, Flax-woed, Toad Flax.
Seipioria, Beafon Flax-woed.
Nola, Pfeudolinaria, Baffard Flax-woed.
Lancea Cristiis, Ophelegiolum, Longis fertemis, Aders Tongue.
Lancela, Quincyverculia, Plantage minor, Ribwort, and Rib-woed Plantain.
Lantana, Pilosorum, Wanting Trefoil.
Lapathum, Ranex, Common Field Dock.
Sanguinaria, Bloodwort Dock.
Acumin, Rumex acutus, Sharp-pointed Dock.
Ariatopicum, Hydrolapathum, Water Dock.
Alarinum, Sea or Marsh Dock.
Equinum, Hippolapathum faturum, Monks Rhubarb Dock.
Lapa morte, Bardana, Arachne, Prophesia, Personata, Greater Bur-Dock.
Minor, Lessaf Bur-Dock.
Lapathum and wood, Bones Heanrique, English Herb Mercur.
Laferpitum, Lateral woed, the Herb which Yields Lafer Gummy, The Gum Lait.
Laxin, Latch Tree, that which as some fly, Yields our Common Turpentine.
Lathyrus pertinax, Cicerrum pertinax, Erumas—Sycophanta, Pefe Everlasting.
Perennis Sycophanta, Wild Pefe Everlasting, or Tyme Everlasting.
Lathyrus, Cainopaeo minor, Equisalvia, Lefter Spurge.
Lavandula, Lavandula, Pfeudanardus, Nardus atalica, Spike, Lavender.
Laudanum, A Medicine eating Pain.
Opium, An Opiate Laudanum.
Volatile, Volatile Laudanum.
Spericam, A Specific Laudanum.
Catharticum, Cathartic or Purging Laudanum.
Laudata nobilis, Veronica, Speed-well.
Lathrus coriun, Lautra, Bur Tree.
Lattina, Lautra, Sycophanta, Teafle.
Lavandula, Cinopaeo minor, Equisalvia, Lefter Spurge.
Lavandula, Lauran, Dodphene, The Bay Tree.
Lavandula, Lathyrus, The Wild Bay.
Lavandula, The Cherry Bay.
Lavandula, Alexandrino, Hippoglossum, Alexandrian Bay, Horle Tongue Bay.
Lavandula, Okeley, Okeley, Nervum, Rose Bay.
Lavandula;
Laureola, Chas. Aegop., Dactyledon, Peelion, Lush, also Laurel Dwar.

Leath, Cinnam. Dactyledon, Wild Bill.

Legumen palastrinum, Chickling Pea.

Len, Place, Places, Lentils.

Leucadendron, Balm.

Atrina, Sea Lentil.

Len pelilis, Ducks-meat.

Lenticula aquatica, Idem.

Leifers, Lentisk or Myrtle Tree.

Lentogala, Per Leonis, Brunonis, Lions-foot, Lion-leaf, Black Turnsp.

Lepadium, Barter, Watercress, Dintarel.

Leptocarya, Near water, Filbert.

Sibylis, Haffe Nut.

Leucocotis, Carina alta, White Flower’s卡尔的 Thistle

Leucocotis, Leucanthemum, Chrysanthemum, Chrysomonii, Camomill.

Lecocipper, Piper album, White Pepper.

Leucocotis lacteus, Keeri, Cheiri, Wall-flower.

Visn sophikhi, Single Wall-flower.

Visn duplicis vel pium, Double Wall-flower.

Levatinum vulgaris, Lapsiperonum tertium Dodece, Syringum Vulchis, Our Common Garden Lavenge.

Lecanthemum, Germanov, German Lavenge.

Leguminia, Libylicum, Libylicum, Silic Montana, Pagi, Ser Montana, Lilick, and Baita Lavenge.

Ligustrum officinale, Ligustrum officinale communi, Ser Montana, Sifels, The true Ligustrum or Baita Lavenge broad Leaved.

Affricum, angustifolium, Silic Montana, Ligustrum officinale, Ligustrum or Baita Lavenge broad Leaved.

Lirionaria, Dwarf Lavenge.

Lilium, Cervina alta, Herb Frankincense.

Licenses, Hepatica vulgaris vel major, Toxorica, or Ground Liverwort.

Minor, Hepatica minor, Small Liverwort.

Marina, Yacca marina, Ophracrus, Lillaca marina, Offer Green.

Arborea, Primula sanguinea, Vood Liverwort, and from Oak Lungs.

Lignum Vitae, Guajacum, Rockwood or Guajacum.

Ligustrum, Mabateh, Phthirica, Priet, Prim-prim.

Notam, Notmak, Barfurd Prives.

Lignum Albus, Xylothes, Vood of Aloe.

Lignum Calaminium, Snake-wood.

Lignum Juniperus, Juniper-wood.

Lignum Nerephetum, Nephritick Vood.

Lignum Rhodum, Aphisulus, Reft or Rhodium Vood.

Lilac, Springs, Lilac, Pipe Shrub.

Lilium, Crinum, Crinum, Laron, Lilly.

Albain, White Lilly.

Americanus, American Lilly.

Argeffif, Vltd Lilly.

Angielifotum, Narrow Leaved Lilly.

Dactyledon, — Corus Imperata, Lilliana of Coonstaline.

Consicillum, Lilly Convally, or of the Vally.

Dorduundee, Florida Lily.

Hemerocallis, Baitafo, Barftad, and Day Lilly.

Imperata, Imperial Lilly.

Lurcum, Yellow or Orange Tawny Lilly.

Maconegon, Mountain Lilly.

Monticella, Mountain Lilly.

Notam, Baita, Lilly.

Nymphis alba, Neaphraf, Water Lilly White.

Nymphis lutus, Water Lilly Yellow.

Pericym, Perian Lilly.

Rubrum, Red or Orange Tawny Lilly.

Rubrum praecox, Early Red Lilly.

Turficum, Turky Lilly.

Verguna, Lilly Convally or Spring Lilly.

Vernation, Frality, Chequer’d Lilly.

Vulpinus, Apfokill or Pay Lilly.

Lilipacinus, Tulpia, The Tulp or true Saxation.

Lerardana, Orbenchon, Gaufs Lezarin, Room Raps.

Limonium, pl. Limone, Limon, Limons.

Limonium, Baphifolium maritimum, Manly Bagflos.

Lingua, Phylitis, Harts or Deers Tongue.

Libonis, Vffed Harts Tongue.

Noth, Hermonitia, Splintum, Baitaard Harts Tongue, or Mates Farn.

Linaria, Pseudoflora, Vood-weat, Todl flax.

Lycosa, Broad Leaved.

Scoparia, Surdernum, Befom Flax-weat.

Repens, Pseudoflora repens, Creeping Flax.

Notit, Pseudoflorina, Baita Flax-weat.

Lingua vis, Vifini fene, All-Keys.

Lingua bonis, Baphifolium Sibylis, Or Tongue.

Lingua Eufala, Idem.

Lingua Bonis, Baphifolium, Biffluge, Vvallaria, Horle Tongue the Herb.

Lingua Serpentis, Lucae Chrifi, Ophigflugm, Adders Tongue.

Lingua Colurnbris, Idem.

Lium jatum, Flax Manned.

Sibylis, Vltd Flax.

Catharicum, Purging Flax, Mill Mountain.

Liquorice, Glycyrrhiza herbeftis, Manured or true Liquorice.

Sibylis, Vltd Liquorice.

Lirion, Liliun, Crinum, Lilly.

Liriaflifolium, Liriaflifolium, Apspholdi Lilly.

Lirionaria, Lirionaria, Tilipus, Tawny, Saturation.

Lisen, Plantago, Plantain.

Lithophorum, lithiuus, Hark's mouth, Gromwell.

Maus — Sibylis, Lezir or Vltd Gromwell.

Repents, Creeping Gromwell.

Lium, Avo Przlis, Vrticus jatum, Damal.

Rubrum, Plume, Red Damal.

Lonclitis, Affacron, Spleenwort.

Vera, Ceterath, True Spleenwort.

Affera, Vfudoflifolium, Roqueh or Baita Spleenwort.

Longina, Lonclitis, Spleenwort.

Lipina, Caffane, Chester.

Lates arbor, Nettle Tree.

Lates Herba, Trudoll Pea.

Lilac, Lingua Serpentis vel Serpentis, Adder's Tongue.

Lunaria Arbiacheia, Auricula Urg, Santias, Barts Far, A Vound Woot.

Lajula, Oxys, Trifolium acetosum, Wood Sorrel.

More alta, Wood Sorrel white Hindered.

More alta, Yellow Howard's.

Lunaria minor, Selenitas, Moon-wort.

Lupinus, Lupine, Hark Bean, Pig Bean.

Lupulua, Lupus faliflorum, Vifta faliflorum, Hops.

Sibylis, — Timonis, — Sibylis vel Samaritana, Wild Hops.

Lutecia, Lates, Dyers Weed, Wall, Well.

Lychnis Pluris, Popularis, The Poplar.

Lychnis falifloris, Campion Manned.

Sed unethical, Corn Campions.

Plumbaria, Feathered Campions.

Sibylis, Vltd Campions.

Astrolepis, — multiflora, Bachelors Buttons.

Chelidonions, Byzantine, Flower of Constantinople.

Lycium,
M. Asch, Macey the Spice.

Maceropiper, Piper longum, Long Pepper.

Allophila, Sagittaria, Sagitt. Arrow-head.

Malloch, Physiocepe species, Privet, Palm-print.

Malus, Ligustrum obtusum, Ballard Pigeon.

Majorana, Arnica, Sampficus, Marjoram.

Herba, Sweet Marjoram.

Lactifera, Pot Marigold.

Sycopsis, Ocaea Fidalia, Wild Marigold.

Birina, Tragoregnes, Goat Marjoram.

Mela infima, Mad Apple.

Malburlantium, Iulianus Indian, Indian Leaf.

Malus sylvestris, Hesperia, Alle-bod.

Maclea, Malus, Mallock.

Malus communis, Common Mallock.

Pulveris, Albus, Marth Mallock.

Verginia, a, a, Verain Mallock.

Arbores, Rafa, Althes Frutes, Shrubs Mallock.

Arborescent, Hollicks.

Major, Garden Mallock, Hollicks.

Mabouia, Malto oblongus, Althea, Mart Mallock.

Malum, p, Mala, An Apple, Apples.

Malum Amanda, Love Apple.

Malum Armeniacum, An Applecock.

Malum Adami vel Majus, Adams Apple.

Malus auratum, An Orange.

Malus aurantium, Idem.

Malum Cirratum, Malum Mandragora, Mandrake Apple.

Malum Odoratum, Queen Apple.

Malus Citrinum, A Citron.

Malus Concomitant, A Quince.

Malus Cydonium, Idem.

Malus Gratissmum, Porangrate.

Malus Hesperium, An Orange.

Malus infima, Mad Apple.

Malus Linnianum, A Limon.

Malus Mortuaria, A Berry.

Malus Medicum, Citrum, A Citron.

Malus Meliphas, A Medlar.

Malus Nectaramus, A Nectarine.

Malus Persicum, A Pears.

Malus Punicum, A Pomegranate.

Malus Squamatum, Summer Goldings.

Malus Syrphiformis, The Crab Apple.

Malus Tereus, Round Birthroot Root.

Malus Terre Persicum, Sourround Root.

Malus Turcicum, Great round Citron, Shaddock.

Mascut, Jucca, Jucca, Heaven, Indian Bread.

Minna, Calabrian or Paring Marra.

Munni, Martis, Quinquemuir, Chintail.

Mandragora Major, Male Mandrake.

Mamfa, Female Mandrake.

Matriciphyllum, Face nixa, Black Knappweed.

Mattisbium, Frazzum, Herbchourd.

Rhombum vulgar, Common White Herbchourd.

Nigrum, Hypsiphonum, Black Herbchourd.

Aquatatum, Aquatica, Water Hench.

Notophyllum, Strickly, Wild Herbchourd.

Montacatissus, Littium Montanum, Mountain Lilly.

Morum, Glycyphyllos, Black Herbchald.

Rapeus, Creeping Herb Mattich.

Syriaca, Albanian Herb Mattich.

Arbor Vitanum, American Arrowleaf, American Arrow, Spanish Arbour.

Mela, Idem.
Index Latinus.

THE
SCENERY AND POETRY
OF THE
ENGLISH LAKES;
A Summer Ramble.

BY CHARLES MACKAY, Esq.,

PROFUSELY ILLUSTRATED WITH SUPERIOR WOOD ENGRAVINGS,
FROM ORIGINAL SKETCHES TAKEN EXPRESSLY FOR THIS WORK,

AND DRAWN ON WOOD BY
HARVEY, M'KEWAN, D. COX, JUN., W. C. SMITH, GREV. FENNELL,
DICKES, W. P. SMITH, EDW. GILKS, ETC.

ENGRAVED BY
THOMAS GILKS.

HE object of this work is to narrate the romantic history, and cull the poetry, of a district which is among the most celebrated, and which all travellers allow to be the most beautiful in Great Britain; to describe every scene that has claims upon the admiration or attention of the visitor, either for its own loveliness or for the reminiscences attached to it. As in "The Thames and its Tributaries" the Author has undertaken to dwell upon romantic and remarkable events, "in the very spots where they occurred, to jog his reader's memory, and to act the part of a gossiping, not a prosy fellow-traveller," making it apparent that, wherever he went, "he could not but remember," and that he never passed unheeding over any ground "that had been dignified by wisdom bravery, or virtue," or had charms for the lover of nature.

THE FALLS, LAKES, AND MOUNTAINS OF NORTH WALES;

BEING A PICTORIAL TOUR THROUGH THE MOST INTERESTING PARTS OF THE COUNTRY.

BY MISS LOUISA STUART COSTELLO,

ILLUSTRATED WITH UPWARDS OF SEVENTY VIEWS OF ALL THOSE ROMANTIC SPOTS WHICH ATTRACT THE ADMIRATION OF THE TOURIST.

FROM ORIGINAL SKETCHES BY D. H. M'KEWAN,

ENGRAVED ON WOOD AND LITHOGRAPHED BY THOMAS AND EDWARD GILKS.

In the present Work the object has been to present to the Traveller, and the lover of the Picturesque, in a portable form, a graphic and correct portraiture of this beautiful and historically important portion of Great Britain; to give to every site its legends and poetical associations, revive the recollections attached to it, and to do for the region of the Harp and the Bard what has been done for its brother-land of Brittany; to beguile the fatigues of travel, and to supply information on the spot, without the necessity of extensive research; and also to amuse the leisure of those who may desire to become acquainted with the most alluring scenes of Nature without seeking for them abroad.

LONDON: LONGMAN, BROWN, GREEN AND LONGMANS, PATERNOSTER ROW.
The merits possess magical a it northward is seek him,* travellers well Miss a entitled Whoever is gratifying is these beautiful spot, picture aged home."

"To those who are fond of legends, we especially commend the tradition 'Climin of the Black Fort,' the story of 'Nesta, and the Wicked Owain,' that of 'Hugh Lloyd' and his magical staff, and the legend of the 'Lions for Letters,' among other. In every page, indeed, we find matter for agreeable extract: but as the volume is very portable, and adapted to every traveller's wallet, we shall advise tourists to possess themselves of the whole, that they may test its merits beside the 'Lakes and Falls,' and beneath the shadow of the 'Mountains' which are described in it."

"A word more in parting in regard to the illustrations, of which there are upwards of seventy.—Mr. M'Kewan has well performed the task allotted to him, and his sketches have been admirably interpreted through the lithographic and wood engravings of Thomas and Edward Gillis.—Morning Chronicle.

"Every lover of the sublime and picturesque, be he a tourist or day-at-home traveller, will thank Miss Costello for this delightful pocket quarter; it is, from first to last, a pleasant narrative, interspersed with just enough anti-quarianism to prevent the reader from finding a poetic appreciation of the celebrated localities in his route; and every charming descriptions of its most sublime scenes and objects. The pages are crowded with attractions and associations of the higher class of thought. Meanwhile, in the work before us, the author and artist have worked in a kindred spirit. It is illustrated with sixteen admirable lithographic sketches, and some fifty exquisite vignettes on wood, the whole executed by Thomas and Edward Gillis, from original drawings by D. H. M'Kewan. The vignettes especially have an arti-tical spirit which is rarely attained in wood engraving."

"We have visited many of the places here written of by Miss Costello, and can bear good testimony to the excellence of her work—to its usefulness as a 'hand-book' for travellers in Wales—and to the beautiful sketches it contains, literary and pictorial."

"A pleasant and lively description of the scenery and antiquities of North Wales, indicating the picturesque beauties, and historical and legendary associations of the most attractive spots. The number of capital wood-cuts, and slight but effective lithographic sketches, render it attractive as a picture book; and the traditions and anecdotes introduced make it readable at home."

"Miss Costello is, indeed, a patriot, thus to devote her talents to the promotion of the most selected beauties of North Wales. Where in all Europe can more lovely spots be found than amongst the lukes of Cumberland, or the scenery of the Falls of North Wales? And yet these gems of natural beauty are comparatively unvisited."

"There is no cabining of the desires when so pleasant a temptress as Miss Costello invites us to wander northward to look at the Eagle Tower, Caernarvon, St. Winifred's Well, Fall of the Swallow, and we know not what beside."

"Miss Costello is diligent in her collection of legends, and paints landscapes, as well as the world knows, well—side her picture of Bodelwyddan, near the Tower. The book is handsomely got up, and liberally illustrated with beautiful wood-cuts, and spirited tinted lithographs."

"Just such a pretty, picturesque, and flowery book, as so inviting, varied, and sweet a subject demands."

"Miss Costello has this month presented a charming contribution to home tourists. It is gratifying to find that she has brought her exquisite sense of the picturesque, and vivid appreciation of local historical association, always simple and unpretending in their enunciation, bear upon a portion of Great Britain."

"The work is profusely illustrated by sketches taken on the spot, by Mr. D. H. M'Kewan, and by wood-cuts, beautifully executed by Gillis, one of our best wood-engravers; and not only is it the most inviting guide-book hitherto presented to tourists, but the existence of so attractive a volume is likely to allure many to become acquainted with the beauties of our own land without going to seek for them abroad."—Anawser's Magazine.

"Miss Costello has presented her readers with a very delightful volume, whether we regard the lovely and interesting descriptions of the various natural objects and relics of antiquity which are under her notice, or the pleasing and well-executed illustrations which embellish the book."—Gentleman's Magazine.

"The thanks of the public are due to the author, the artist, and the engraver, whose talents and skill have been united to bring out this beautiful publication."

"The book before us is a new proof of the increasing taste for archeology, and is well calculated to draw popular attention not only to the beautiful scenery, but to the interesting monuments and traditions of Wales. It is written in a pleasing style; and the text does no less credit than the woodcuts to the illustrators of the artists and engravers."

"Innumerable as are the illustrative works having for their object the guidance of the tourist through the most beautiful and picturesque scenery, their appearance is always hailed with gratification, and generally rewarded with liberal patronage. The book before us is entitled to both. It has been made to jog along companion ship with the pencil; and, as we have them here, two more agreeable associates it is impossible to conceive. Miss Costello alludes most pleasantly to aged mote,' and 'ivy-mantled tower,' and there is an artistic character about her descriptions which we rarely find in such works."

"D. H. M'Kewan represents the craven, and wields it in a manner which argues for him a fast coming fame. The translation of the vignettes records great credit upon Thomas and Edward Gillis, the wood-engravers, who have caught the terror of the artist, and followed it out in a sympathetic and quite unmechanical spirit."—Glasgow Argus.

This volume is well got up in drawing-room attire, and is evidently intended as an intellectual companion in such quarters. If that spirit of pride which ought to accompany every work of art can be extended to this, it must feel grateful to Miss Costello. The style is simple and elegant. But it must be confessed that others share with it this quality."

There are 16 lithographic sketches, and 55 illustrations on wood—all by these gentlemen, who have made it a perfect panorama in miniature.—Interesserus Journal.
